Reprint of "Consolidated Listing of Notices"

An extract from the Decision Leaflet and the OFFICIAL GAZETTE of January 16, 1968, entitled "Consolidated Listing of Recent O.G. Notices Re Patent Office Practices and Procedures" has been reprinted and is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402. Price 10 cents.

Modification of Notice of January 31, 1967

The practice set forth in the notice of January 31, 1967, entitled "Double Patenting" (834 O.G. 1615), is modified to the extent that when a single inventive entity is involved a terminal disclaimer will be accepted to avoid a double patenting rejection even if the claims overlap, if the claims which would otherwise be subject to such rejection could not have been allowed in the other application or patent, and if the terminal disclaimer further provides that the patent shall expire immediately if it ceases to be commonly owned with the other application or patent.

EDWARD J. BRENNER,
Commissioner.

Feb. 14, 1968.

Disclaimers and Dedications

2,889,775.—*Harold D. Owen*, Fort Worth, Tex. OPEN HOLE PERFORATOR FIRING MEANS. Patent dated June 9, 1959. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,908,222.—*Andre Blanchard* and *James B. Shore*, Houston, Tex. APPARATUS FOR DETONATING SHAPED EXPLOSIVE CHARGES. Patent dated Oct. 13, 1959. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,912,930.—*Blake M. Caldwell*, Fort Worth, Tex. PERFORATING ASSEMBLY. Patent dated Nov. 17, 1959. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,915,011.—*Robert B. Hamill*, Great Bend, Kans. STABILIZER FOR WELL CASING PERFORATOR. Patent dated Dec. 1, 1959. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,924,173.—*John J. Robertson*, Fort Worth, Tex. WELL PERFORATOR FIRING MEANS. Patent dated Feb. 9, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,925,775.—*Donovan S. McKee*, Oklahoma City, Okla. WELL CASING PERFORATOR. Patent dated Feb. 23, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,926,603.—*Will H. Lindsay, Jr.*, Fullerton, Calif. WELL PERFORATOR SHAPED CHARGE. Patent dated Mar. 1, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,927,485.—*Joe W. Dobkins*, Fort Worth, Tex. MACHINE FOR BLOCKING SCREW THREADS. Patent dated Mar. 8, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,927,644.—*Blake M. Caldwell*, Fort Worth, Tex. JUNK BASKET. Patent dated Mar. 8, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,935,020.—*George C. Howard*, Tulsa, Okla., and *Blake M. Caldwell*, Arlington, Tex. APPARATUS FOR CUTTING HOLES IN WELL CASING. Patent dated May 3, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignees, *Pan American Petroleum Corporation* and *Halliburton Company*.

Hereby disclaim and dedicate to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

Adjudicated Patents

(D.C.N.Y.) Ritter Patent No. 2,563,673 (260—545), for METHOD OF PRODUCING N-MONO SUBSTITUTED IMIDIC COMPOUNDS, *Held* valid but not infringed. *Ritter* v. *Rohm and Haas Co.*, 271 F. Supp. 412; — USPQ —.

(D.C. Wis.) Leach, Manthie and Clapp Patent No. 2,580,306 (302—56), for SILO UNLOADER. Claims 2, 6, 8, 11, 12, 15 to 17, and 20 *Held* invalid and infringed. *Leach* v. *Rockwood & Co.*, 273 F. Supp. 779; 154 USPQ 357.

(D.C. Del.) Sperti Patent No. 2,588,337 (99—205), for CONCENTRATION OF ORANGE JUICE. Claims 2 and 3 *Held* valid but not infringed. *Sperti Products, Inc.* v. *Coca-Cola Co.*, 272 F. Supp 441; 155 USPQ 551.

(D.C. Mich.) Allen Patent No. 2,593,957 (73—37.9), for FLUID LEAKAGE GAUGING DEVICE. Claims 9 to 13 and 15 *Held* invalid. *The Bendix Corp.* v. *Freeland Gauge Company*, 271 F. Supp. 888; 154 USPQ 284.

(D.C.N.Y.) Dangelmajer Patent No. 2,643,983 (260—40), for COMPOSITION OF MATTER. Claims 1 and 3 *Held* invalid but not infringed. *Emsig Mfg. Co.* v. *Merit Plastics*, 270 F. Supp. 841; 154 USPQ 76.

(D.C. Wis.) Randolph T. Rosten Patent No. 2,906,332 (137—624.2), for AUTOMATIC CONTROL APPARATUS FOR A MOTOR-DRIVEN WATER SOFTENER. Claim 9 *Held* invalid. *Rosten* v. *Borerud Mfg. Co.*, 271 F. Supp 874; — USPQ —.

(D.C. Del.) Cole, Walker, and Reed Patent No. 2,967,778 (99—205), for METHOD FOR MAKING JUICE CONCENTRATES. Claims 4 to 8 *Held* invalid. *Sperti Products, Inc.* v. *Coca-Cola Co.*, 272 F. Supp. 441; 155 USPQ 551.

(D.C.N.Y.) Gans Patent No. 2,986,857 (53—48), for MACHINE AND METHOD FOR PACKING ARTICLES. Claim 4 *Held* invalid. *Old Dominion Box Co.* v. *Continental Can Co.*, 273 F. Supp. 550; 155 USPQ 70.

(D.C.N.Y.) Weiss Patent No. 2,990,997 (229—40), for PAPERBOARD CARRIER. Claims 1, 2 and 4 *Held* invalid. *Id.*

(D.C.N.Y.) Bratz Patent No. 3,015,969 (74—501), for PUSH-PULL CABLE. Claims 1 and 4 *Held* invalid. *Teleflex, Inc.* v. *American Chain & Cable Co.*, 273 F. Supp. 573; — USPQ —.

(D.C.R.I.) Ronci Patent No. 3,050,877 (36—34), for HEEL LIFT. Claims 1 to 4 *Held* invalid and not infringed. *Eastern Plastic Corp.* v. *Ronci*, 273 F. Supp. 853; 154 USPQ 489.

(D.C. Ill.) Williams Patent No. 3,057,467 (206—46), for PACKAGE FOR TREATING AGENTS AND DISPOSABLE APPLICATOR FORMING A PART THEREOF. Claims 1 and 2 *Held* valid and infringed. *Canaan Products Inc.* v. *Edward Don & Co.*, 273 F. Supp. 492; 154 USPQ 393.

(D.C. Ill.) Brekke Patent No. 3,083,930 (243—118.4), for WINDING FORMS. Claims 4 and 5 *Held* invalid. *Amerline Corp.* v. *Cosmo Plastics Co.*, 271 F. Supp. 215; 153 USPQ 707.

(D.C. Mich.) Freeman and Freeman Patent No. 3,090,614 (279—273), for HOLDER. *Held* invalid. *Stilson Tool, Inc.* v. *Associates Mach. Co. et al.*, 271 F. Supp. 597; 154 USPQ 76.

(D.C. Ill.) Muszyuski and Weuuch Patent No. 3,117,294 (336—192), for BOBBIN AND INSULATED LEAD-IN MEANS. Claims 1 to 4 *Held* invalid. *Amerline Corp.* v. *Cosmo Plastics*, 271 F. Supp. 215; 153 USPQ 707.

(D.C. Ill.) Hyde, McLaughlin and Kuellmar Patent No. 3,168,053 (15—93), for MOVABLE BULKHEAD FOR RAILROAD CARS, *Held* invalid but infringed if valid. *Unarco Industries, Inc.* v. *Evans Products Co.*, 275 F. Supp. 331; 155 USPQ 234.

(D.C. Iowa) Isbell Patent No. 3,210,767 (342—792.5), for FREQUENCY INDEPENDENT UNIDIRECTIONAL ANTENNAS, *Held* invalid. *University of Illinois Foundation* v. *Winegard Co.*, 271 F. Supp. 412; 155 USPQ 58.

(D.C.N.Y.) McNeill Design Patent 195,311 (D81—4), for PAIR OF SPECTACLES, *Held* invalid. *Bachmann Bros., Inc.* v. *Optic-Ray Inc.*, 273 F. Supp. 847; 155 USPQ 160.

Patent Cases

[37 CFR Parts 1, 3]

FORMS, AND RULES OF PRACTICE

Notice of Proposed Defensive Publication Program

Notice is hereby given that the Patent Office proposes to amend the rules of practice relating to patents in the manner set forth below. The amendments are proposed pursuant to the authority contained in Title 35 U.S.C., section 6.

All persons interested in presenting their views and objections and recommendations in connection with the proposed changes are invited to do so on or before Wednesday, March 27, 1968, on which day a hearing will be held at 10:00 a.m. in Room 3D50 of Crystal Plaza Building 34. All persons wishing to be heard orally are requested to notify the Commissioner of Patents of their intended appearance.

Sections 1.11, 1.14, 1.101, 1.103, 1.108 and 1.201 of Title 37 CFR (Patent Rules 11, 14, 101, 103, 108 and 201) are proposed to be amended and a new § 1.139 (Patent Rule 139) is proposed to be added for the purpose of instituting a new defensive publication program. A new section 3.50 is proposed to be added for the purpose of implementing the new defensive publication program.

This program is intended to provide better service to the public by making available the technical disclosure of certain applications in which the owner may prefer to publish an abstract in lieu of obtaining an examination by the Patent Office. The defensive publication would be in the form of an abstract of the technical disclosure, printed in the OFFICIAL GAZETTE and made a part of the Patent Office search files. The application would be open to public inspection and would continue to be a pending application for purposes of interferences for a limited period of time. This program would be open to any applicant filing a request before the designated application has received a first action by the Patent Office and agreeing to the conditions of the program, including waiving his rights to a patent and expressly abandoning his application, the abandonment to take effect five years after the earliest effective filing date of the application.

The proposed changes follow:

1. In § 1.11, delete "Patent" from the title. Identify the one paragraph now in the section as paragraph "(a)" and follow with a new paragraph "(b)," so that the section reads as follows:

§ 1.11 *Files open to the public.*

(a) After a patent has been issued, the specification, drawings, and all papers relating to the case in the file of the patent are open to inspection by the general public, and copies may be furnished upon paying the fee therefor. The file of any terminated interference involving a patent, or an application on which a patent has subsequently issued, is similarly open to public inspection and procurement of copies. See § 2.27 for trademark files.

(b) Applications in which the Office has accepted a waiver of rights to a patent filed under § 1.139 are open to inspection by the general public, and copies may be furnished upon paying the fee therefor.

2. In § 1.14, insert "Except as provided in § 1.11(b)" at the beginning of the first sentence of both paragraphs (a) and (c), delete "patent" from the first sentence of paragraph (a), so that these paragraphs read:

§ 1.14 *Patent applications preserved in secrecy.*

(a) Except as provided in § 1.11(b) pending applications are preserved in secrecy. No information will be given by the Office respecting the filing by any particular person of an application for a patent, the pendency of any particular case before it, or the subject matter of any particular application, nor will access be given to or copies furnished of any pending application or papers relating thereto, without written authority of the applicant, or his assignee or attorney or agent, unless it shall be necessary to the proper conduct of business before the Office or as provided by these rules.

(b) Except as provided in § 1.11(b) abandoned applications are likewise not open to public inspection, except that if an application referred to in a United States patent is abandoned and is available, it may be inspected or copies obtained by any person on written request, without notice to the applicant. Abandoned applications may be destroyed after twenty years from their filing date, except those to which particular attention has been called and which have been marked for preservation. Abandoned applications will not be returned.

3. In § 1.101, add "except for those applications in which the Office has accepted a waiver of rights to a patent filed under § 1.139" at the end of the last sentence of paragraph (a), so that it reads:

§ 1.101 *Order of examination.*

(a) Applications filed in the Patent Office and accepted as complete applications (§§ 1.53 and 1.55) are assigned for examination to the respective examining divisions having the classes of inventions to which the applications relate. Applications shall be taken up for examination by the examiner to whom they have been assigned in the order in which they have been filed except for those applications in which the Office has accepted a waiver of rights to a patent filed under § 1.139.

4. In §1.103, add a new paragraph (d) to read as follows:

§ 1.103 *Suspension of action.*

(d) Action on applications in which the Office has accepted a waiver of rights to a patent filed under § 1.139 will be suspended for the entire pendency of these applications except for purposes relating to proceedings under § 1.201(b).

5. In § 1.108, delete "and forfeited" in the title and the first sentence, and add "unless a waiver as in § 1.139 has been filed in and accepted by the Patent Office" at the end of the first sentence, so that it reads as follows:

§ 1.108 *Abandoned applications not cited.*

Abandoned applications as such will not be cited as references unless a waiver as in § 1.139 has been filed in and accepted by the Patent Office.

6. In paragraph (b) of § 1.201, delete "for patent" both times it appears, and insert "applications" before "for reissue" in both instances so that the paragraph reads as follows:

§ 1.201 *Definition, when declared.*

(b) An interference will be declared between pending applications, or applications for reissue, of different parties when such applications contain claims for substantially the same invention, which are allowable in the application of each party, and interferences will also be declared between pending applications, or applications for reissue, and unexpired original or reissued patents, of different parties, when such applications and patents contain claims for substantially the same invention which are allowable in all of the applications involved, in accordance with the provisions of these rules.

7. A new § 1.139 is proposed to be added, the full text of which will read as follows:

§ 1.139 *Waiver of patent rights.*

An applicant may waive his rights to a patent based on a pending application by filing in the Patent Office a written waiver of patent rights, consent to the publication of an abstract, and declaration of abandonment signed by the applicant and the assignee of record or by the attorney or agent of record.

8. A new Section 3.50 is proposed to be added to read as follows:

§ 3.50 *Disclaimer of right to patent.*

The undersigned, having on _____ filed an application for patent, Serial No. _____ entitled _____, hereby disclaims or waives his right to a patent based on said application, subject to acceptance by the Commissioner, and requests that an abstract of the disclosure thereof be published in the OFFICIAL GAZETTE, that the application be opened for public inspection upon publication of said abstract, and that the application be considered pending only for the purpose of interference; and, further, the undersigned expressly abandons said application, the abandonment to take effect five (5) years after the earliest effective filing date of the application, or upon final judgment in an interference pending at that time, or immediately, if, with reference to the application hereinabove identified or any other application for which a disclaimer of right to patent has been filed, the undersigned hereafter causes or permits the words "patent applied for," "patent pending," or any other words of similar import or meaning, to be marked upon, affixed to, or used in advertising in connection with any article.

(Sec. 1, 66 Stat. 792; 35 U.S.C. 6)

EDWARD J. BRENNER,
Commissioner of Patents.

Feb. 16, 1968.

Approved:

JOHN F. KINCAID,
Assistant Secretary for Science and Technology.

Procedure Under Proposed Defensive Publication Program

Under the program in the foregoing notice, the published abstract of an application will be treated as prior art under 35 U.S.C. 102(a) or 102(b) as a printed publication from the date of publication; and the application will be treated as prior art under 35 U.S.C. 102(a) as evidence of prior knowledge effective on the actual date of filing of the application in the Patent Office.

EDWARD J. BRENNER,
Commissioner.

Feb. 19, 1968.

PATENT EXAMINING CORPS

R. A. WAHL, Assistant Commissioner

CONDITION OF PATENT APPLICATIONS AS OF JANUARY 1, 1968

PATENT EXAMINING OPERATIONS AND GROUPS	Actual Filing Date of Oldest Case Awaiting Action	
	New	Amended
CHEMICAL EXAMINING OPERATION—I. MARCUS, Director.		
GENERAL CHEMISTRY AND PETROLEUM CHEMISTRY, GROUP 110—R. L. CAMPBELL, Manager. Inorganic Compounds; Inorganic Compositions; Organo-Metal and Organo-Metalloid Chemistry; Metallurgy; Metal Stock; Electro Chemistry; Batteries; Hydrocarbons; Mineral Oil Technology; Lubricating Compositions; Gaseous Compositions; Fuel and Igniting Devices.	7- 1-64	6-19-62
GENERAL ORGANIC CHEMISTRY, GROUP 120—M. STERMAN, Manager. Heterocyclic; Amides; Alkaloids; Azo; Sulfur; Misc. Esters; Carbohydrates; Herbicides; Poisons; Medicines; Cosmetics; Steroids; Oxo and Oxy; Quinones; Acids; Carboxylic Acid Esters; Acid Anhydrides; Acid Halides.	11-27-64	7-23-62
HIGH POLYMER CHEMISTRY, PLASTICS AND MOLDING, GROUP 140—L. J. BERCOVITZ, Manager. Synthetic Resins; Rubber; Proteins; Macromolecular Carbohydrates; Mixed Synthetic Resin Compositions; Synthetic Resins With Natural Polymers and Resins; Natural Resins; Reclaiming; Pore-Forming; Compositions (Part) e.g.: Coating; Molding; Ink; Adhesive and Abrading Compositions; Molding, Shaping and Treating Processes.	3-30-65	5-15-62
COATING AND LAMINATING, BLEACHING, DYEING AND PHOTOGRAPHY, GROUP 160—J. R. LIBERMAN, Manager. Coating; Processes and Misc. Products; Laminating Methods and Apparatus; Stock Materials; Adhesive Bonding; Special Chemical Manufactures; Special Utility Compositions; Bleaching; Dyeing and Photography.	10-30-64	7-12-62
SPECIALIZED CHEMICAL INDUSTRIES AND CHEMICAL ENGINEERING, GROUP 170—W. B. KNIGHT, Manager. Fertilizers; Foods; Fermentation; Analytical Chemistry; Reactors; Sugar and Starch; Paper Making; Glass Manufacture; Gas; Heating and Illuminating; Cleaning Processes; Liquid Purification; Distillation; Preserving; Liquid and Solid Separation; Gas and Liquid Contact Apparatus; Refrigeration; Concentrative Evaporators; Mineral Oils Apparatus; Misc. Physical Processes.	6- 1-64	9-25-62
ELECTRICAL EXAMINING OPERATION—N. H. EVANS, Director.		
INDUSTRIAL ELECTRONICS AND RELATED ELEMENTS, GROUP 210—J. F. COUCH, Acting Manager. Generation and Utilization; General Applications; Conversion and Distribution; Heating and Related Art Conductors; Switches; Miscellaneous.	4- 1-65	9-12-63
SECURITY, GROUP 220—S. BOYD, Manager. Ordnance, Firearms and Ammunition; Radar, Underwater Signalling, Directional Radio, Torpedoes, Seismic Exploring, Radio-Active Batteries; Nuclear Reactors, Powder Metallurgy, Rocket Fuels; Radio-Active Material.	2- 5-65	7-30-64

Total number of Design applications pending	3,859
Total number of applications awaiting action (excluding Designs)	124,193
Total number of Design applications awaiting action	1,697
Date of oldest new application awaiting action	June 1, 1964
Date of oldest amended application awaiting action	March 12, 1962

EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during March 1968, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1965*.

Patents ..... Numbers 2,543,744 to 2,546,957, inclusive

Plant Patents ..... Numbers 1,007 to 1,009, inclusive

PATENT EXAMINING OPERATIONS AND GROUPS (Continued)	Actual Filing Date of Oldest Case Awaiting Action	
	New	Amended
MECHANICAL EXAMINING OPERATION—F. H. BRONAUGH, Director.		
HANDLING AND TRANSPORTING MEDIA, GROUP 310—A. BERLIN, Manager. Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Dispensing; Fluid Sprinkling; Fire Extinguishers; Coin Handling; Check Controlled Apparatus; Classifying and Assorting Solids; Boats; Ships; Aeronautics; Motor and Land Vehicles and Appurtenances; Railways and Railway Equipment; Brakes; Rigid Flexible and Special Receptacles and Packages.	10- 3-66	11-23-64
MATERIAL SHAPING, ARTICLE MANUFACTURING, TOOLS, GROUP 320—N. BERGER, Manager. Manufacturing Processes, Assembling, Combined Machines, Special Article Making; Metal Deforming; Sheet Metal and Wire Working; Metal Fusion—Bonding, Metal Founding; Metallurgical Apparatus; Plastics Working Apparatus; Plastic Block and Earthenware Apparatus; Machine Tools for Shaping or Dividing; Work and Tool Holders; Woodworking; Tools; Cutlery; Jacks.	4- 1-66	3-27-63
AMUSEMENT, HUSBANDRY, PERSONAL TREATMENT, INFORMATION, GROUP 330—A. RUEGG, Manager. Amusement and Exercising Devices; Projectors; Animal and Plant Husbandry; Butchering; Earth Working and Excavating; Fishing, etc.; Tobacco; Artificial Body Members; Dentistry; Jewelry; Surgery; Toiletry; Printing; Typewriters; Stationery; Information Dissemination.	10-14-65	5-12-64
HEAT AND POWER ENGINEERING, GROUP 340—C. F. GAREAU, Manager. Power Plants; Combustion Engines; Fluid Motors; Pumps; Turbines; Heat Generation and Exchange; Refrigeration; Ventilation; Drying; Vaporizing; Temperature and Humidity Regulation; Machine Elements; Power Transmission.	8- 1-66	4-26-65
FIXED CONSTRUCTIONS, SUPPORTS, AND HARDWARE, GROUP 350—T. J. HICKEY, Manager. Joints; Fasteners; Rod, Pipe and Electrical Connectors; Miscellaneous Hardware; Locks; Building Structures; Closure Operators; Bridges; Closures; Earth Engineering; Drilling; Mining; Furniture; Receptacles; Supports; Cabinet Structures.	6-27-66	11- 4-63
TEXTILES, CLEANING AND FLUID HANDLING, GROUP 360—W. S. COLE, Manager. Fluid Handling, including Valves; Conduits; Filling Receptacles; Lubrication; Joint Packing; Bathroom Fixtures; Centrifugal Separators; Cleaning; Coating; Pressing; Agitating; Foods; Textiles; Apparel and Shoes and their Manufacture; Sewing Machines; Winding and Reeling.	10-23-65	4-19-63

DECISIONS IN PATENT AND TRADEMARK CASES

U.S. Court of Customs and Patent Appeals

IN RE DAVID G. BRAITHWAITE

No. 7801. Decided June 15, 1967

[54 CCPA —; 379 F.2d 606; 154 USPQ 38]

1. PATENTABILITY—DOUBLE PATENTING—TERMINAL DISCLAIMER—OVERLAPPING CLAIMS.

"For policy reasons particularized in our opinion in No. 7800, we think that on the facts before us it is in the public interest to decide as we did in *Robeson* and *Kaye*. We therefore give effect to the terminal disclaimer to overcome the double patenting rejection as to the appealed claims [which overlap with the patent claims] and the decision of the Board is reversed."

REVERSED.

Marzall, Johnston, Cook & Root, Richard L. Johnston, Herbert B. Keil for appellant.

Joseph Schimmel (*Joseph F. Nakamura*, of counsel) for the Commissioner of Patents.

Before WORLEY, *Chief Judge*, RICH, SMITH, and ALMOND, *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK [1]

RICH, *J.*, delivered the opinion of the court.

This appeal is from the decision of the Patent Office Board of Appeals, adhered to on reconsideration, affirming the rejection of claims 1–3 and 16–18 of application Serial No. 94,124, filed March 8, 1961, for "Preparation of Organic Compounds of Metals." The Board reversed the rejection of claims 4–15 and they stand allowed.

This is a companion appeal to No. 7800, decided concurrently. This application, like that in No. 7800, is a continuation-in-part of application Serial No. 811,262, now Patent No. 3,007,858, granted November 7, 1961. We shall assume knowledge of our other opinion.

The invention here is directed to an electrolytic process for forming organo metallic compounds. Claims 1–3 are for process and claims 16–18 for electrolyte compositions. The claimed invention contemplates the use of a wide variety of metals as sacrificial anodes and the consequent production of a like variety of metallic compounds. Claims 1–3 refer to "metal" broadly and the supporting application disclosure is of lead, aluminum, calcium, zinc, cadmium, manganese, mercury, lanthanum, thallium, arsenic, bismuth, tellurium, and selenium.

The rejection is on the ground of double patenting in view of the claims of Patent No. 3,007,858, the following prior art references being also relied on to support that rejection:

Calingaert et al., 2,535,193, Dec. 26, 1950.

French et al., Journal of the American Chemical Society, vol. 52 (1930), pages 4904–4906.

Assignee, Nalco Chemical Company, filed a terminal disclaimer of any part of the term of a patent to be granted on this application which would extend beyond the expiration date of Patent No. 3,007,858, November 7, 1978.

Appellant relied on our decisions in *In re Robeson*, 51 CCPA 1271, 331 F.2d 610, 141 USPQ 485, and *In re Kaye*, 51 CCPA 1465, 332 F.2d 816, 141 USPQ 829, and the Board relied on *In re Siu*, 42 CCPA 864, 222 F.2d 267, 105 USPQ 428. (As to allowed claims 4–15, the

[1] Senior District Judge, Eastern District of Pennsylvania, sitting by designation.

Board found the terminal disclaimer effective to overcome the double patenting rejection because these claims contained specific recitations either of metals or of organic radicals "not claimed in the prior patent," which we take to mean not *recited* in any claims as distinguished from not *covered* by any claims.)

The problem in this case is very like that in No. 7800 with this difference as to claims 1–3. These claims, in the Board's words, are "generic to patent claim 1," that is, at least as to the metal, they are broader in defining it as "metal" instead of naming lead. Claim 1 on appeal reads:

> 1. A process for preparing *organo metallic* compounds which comprises electrolyzing, using a *sacrificial metal anode*, a substantially anhydrous solution of a Grignard reagent in a substantially inert organic solvent for said Grignard reagent, adding extraneous organic halide to said solution, and recovering from the resultant product an *organo metallic* compound consisting of hydrocarbon radicals linked directly to *the metal* of the sacrificial anode. [Emphasis ours.]

Claim 2 adds the limitation that 0.1 to 1.5 moles of extraneous organic halide per mole of Grignard reagent is used and claim 3 further adds limitation to use of a plurality of extraneous organic halides. In appeal 7800 the broader claims were in the issued patent and here, at least as to the metal recitation, they are in the continuation-in-part on appeal. This presents a somewhat different situation but not one so different, in our view, as to call for a different result. The Board treats the two cases alike and pursued a rule which it derives from two of our earlier decisions, *In re Zickendraht*, 50 CCPA 1529, 319 F.2d 225, 138 USPQ 22 (1963), and *In re Ockert*, 44 CCPA 1024, 245 F.2d 467, 114 USPQ 330 (1957). This rule it describes as "The well established doctrine that claims in a second application must define a patentably distinct invention over the claims of an appellant's prior patent * * * regardless of the comparative scope of the claims or of the order in which the claims were presented." In neither of these cases was there any consideration of a terminal disclaimer since in neither case was one filed.[2] *Ockert* was essentially a single invention type of situation like *Siu*, and *Zickendraht* was at the very beginning of the period of our recent rethinking of the double patenting situation. In fact it was in footnote 4 of the concurring opinion of the writer therein that the suggestion was made which appears to have resulted in increasing use of the terminal disclaimer to avoid double patenting. In the present case the Board has accepted as effective such a disclaimer apparently where it has found the patent and application claims to be mutually exclusive, as illustrated by comparing patent claim 1 to making *alkyl* lead compounds with allowed application claim 4 to making *phenyl* lead compounds.[3] Alkyl, of course, does not include phenyl. The Board has drawn the line to exclude new claims which would dominate the patent claims.

Appellant's purpose in filing the instant application is clearly stated in it. Referring to the parent application for the issued patent, it says:

> In my said copending application there is broadly disclosed a process for the preparation of organic metallic compounds. However, the claims of said applica-

[2] The Solicitor adds reference to *In re Simmons*, 50 CCPA 990, 312 F.2d 821, 136 USPQ 450 (1963). That too was a case in which there was no terminal disclaimer.

[3] Patent claim 1 is in our opinion in No. 7800. Application claim 4 herein reads as follows:

> 4. A process for preparing *phenyl lead* compounds which comprises electrolyzing, using a lead anode, a substantially anhydrous solution of a Grignard reagent in a substantially inert organic solvent for said Grignard reagent, employing an electrolyzing current effective to cause said anode to dissolve in said solution of said Grignard reagent in said organic solvent, adding *extraneous phenyl halide* to said solution, and recovering from the resultant product an organic lead compound consisting of phenyl radicals linked directly to metallic lead. [Emphasis ours.]

tion are limited to the preparation of alkyl lead compounds. The purpose of the present application is to cover the process in its broader aspects and also to cover specific processes other than the manufacture of alkyl lead compounds.

Like the other continuation-in-part application in No. 7800, the applicant has supplied much additional technical disclosure relevant to what he is now claiming, disclosing the above-mentioned added metals operable in his invention and 15 new specific examples covering the use of aluminum, zinc, manganese, cadmium, and bismuth, as well as lead. Claims such as claim 1 herein, drawn broadly enough to cover the numerous metals dealt with in this application, are also broad enough to cover the alkyl lead of the patent and so dominate claims of the patent as stated.

As in No. 7800, we agree with the Patent Office that there would be double patenting and we would have to affirm were it not for the terminal disclaimer. Indeed, appellant has conceded this point in his brief with respect to claims 16 and 17. This disposes of the main argument in the Solicitor's brief.

As to the terminal disclaimer and its effect in view of our decisions in *Robeson* and *Kaye*, the Solicitor points out correctly that there are factual differences between those cases and this one in that there is overlap between the appealed claims and the patent claims. Specifically, he states that appealed claims 1, 2, and 3 are generic to patent claim 1 and that patent claim 1 would include the use of some of the electrolytes encompassed by appealed claim 18. His plea is "that the situation presented in this case is not the type to which the decision in the *Robeson* case and the *Kaye* case should be applied."

[1] For policy reasons particularized in our opinion in No. 7800, we think that on the facts before us it is in the public interest to decide as we did in *Robeson* and *Kaye*. We therefore give effect to the terminal disclaimer to overcome the double patenting rejection as to the appealed claims and the decision of the Board is reversed.

REVERSED.

WORLEY, *Chief Judge*, and KIRKPATRICK, *J.*, did not participate.

SMITH, *J.*, concurring.

I concur in the result reached by the majority for the reasons stated in my concurring opinion in PA 7800, *In re Braithwaite*, decided concurrently herewith.

U.S. Court of Customs and Patent Appeals

IN RE CARL-LUDWIG NOTTEBOHM AND ROBERT SCHABERT

No. 7802. Decided June 15, 1967

[54 CCPA—; 378 F.2d 964; 154 USPQ 41]

1. PATENTABILITY—OBVIOUSNESS—LAMINATED PRODUCT.

"Schramm discloses a laminated and moisture-permeable collar stock made by laminating two sheets of textile fabrics together, using as the binder therebetween a thermoplastic vinyl plastic. This is basically the type of products appellants are claiming. True, appellants use a particular sheeting material and a particular thermoplastic resin not shown in Schramm. However, these particular materials are clearly disclosed in the secondary references. In view of the fact that all three references are directed to the art of making a collar stock and the fact that the specific materials disclosed in the secondary references are employed for substantially the same purposes as those of the corresponding materials in Schramm, we find no error in the manner in which these references are combined. In this regard we note that though Evans prefers to use a film of polyethylene as the binding material, the patent does

disclose the coating of a fabric surface by spraying or brushing an aqueous suspension or emulsion of polyethylene which, as the Examiner has suggested, may result in a particulate deposit. In any event, Evans was not specifically concerned with a moisture and air-permeable product whereas Schramm is specifically directed to the manufacture of such a product. We are of the opinion that, given the need for such a permeable product, it would be obvious to modify the layer of bonding material of Evans to that shown by Schramm."

2. SAME—CRITICALLY—ROUTINE EXPERIMENTAL DETERMINATION.

"We are also not persuaded by the affidavit of Schabert ['in an attempt to show the criticality of the molecular weight and amount of the claimed polyethylene particles']. Appellants' claimed range of molecular weight is inclusive of one specific number disclosed in Evans. As to the amount of the binder resin to be used, we find the appellants' claimed range to be obvious within the meaning of 35 U.S.C. 103. Once the desired objective or producing a moisture and air-permeable collar stock is stated, the amount of polyethylene binder to be used in such a product seems to us to be susceptible to routine experimental determination, absent some unforeseeable difficulty."

3. SAME—OBVIOUSNESS.

"Appellants contend that the method of Schramm, when carried out with the polyethylene particles would cause a binder deposit of about 80 grams per square yard, thus resulting in a product which is too stiff and unsuitable. We note, however, that there is no claim that appellants' method of depositing the polyethylene particles is unique or unobvious, and that the claims are not directed to the method of such deposition. There is no showing that once the optimum amount of polyethylene to be used has been determined, that amount cannot be deposited onto the sheet materials by an obvious method."

4. SAME—PARTICULAR SUBJECT MATTER—"PRODUCTION OF NON-WOVEN FABRICS SUITABLE FOR USE IN STIFFENING GARMENTS."

The refusal of certain claims in an application entitled "Production of Non-Woven Fabrics Suitable for Use in Stiffening Garments," as unpatentable over the prior art, is affirmed.

AFFIRMED.

Burgess, Dinklage & Sprung, Arnold Sprung, Michael G. Gilman for appellants.

Joseph Schimmel (*Raymond E. Martin*, of counsel) for the Commissioner of Patents.

Before WORLEY, *Chief Judge*, RICH, SMITH, and ALMOND, *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK [1]

SMITH, *J.*, delivered the opinion of the court.

Appellants appeal from a decision of the Board of Appeals affirming the final rejection of claims 2–4 of their application.[2] No claim has been allowed.

The appealed claims were treated by both parties as a group and they stand or fall together. Claim 2 is illustrative and reads:

2. A non-woven fabric interlining material capable of being permanently attached to a fabric by heat pressing consisting of an open skeleton of polyposed fibers bonded together predominantly at their crossing points with a bonding agent and having at least one free surface thereof uniformly spot-wise coated with exposed discrete polyethylene particles of a molecular weight between about 5,000 and 70,000 in an amount of about 5 to 50 grams per square yard, said fibres predominantly having a higher melting point than said polyethylene.

Claim 3 is similar to claim 2 but calls for fused thermoplastic fibers as the bonding agent. Claim 4 is directed to a method for attaching a non-woven interlining to a second fabric by sandwiching polyethylene particles between the interlining and the fabric and then hot-pressing the assembly together.

The invention relates to a non-woven interliner, useful as a stiffening material for shirt collars and cuffs, which can be combined with

[1] Senior District Judge, Eastern District of Pennsylvania, sitting by designation.
[2] Serial No. 28,878, filed May 13, 1960, for "Production of Non-Woven Fabrics Suitable for Use in Stiffening Garments."

a second fabric by simply hot-pressing the interliner onto the fabric. The interliner is made by sprinkling comminuted polyethylene particles, in an amount between 0.5 and 50 grams per square yard of fabric, onto a non-woven fabric and then heating the combination to adhere the particles to the non-woven fabric. It appears from the application that 5 to 50 grams of polyethylene per square yard are preferred for making strong and permanent interliners but that 0.5 to 5 grams of polyethylene per square yard are suitable for making a temporarily fusible interliner which is useful in certain tailoring operations.

The question is whether the claimed subject matter was properly rejected under 35 U.S.C. 103 as obvious in view of the following prior art:

Evans et al. [Evans], 2,237,344, Apr. 8, 1941.
Schramm, 2,603,575, July 15, 1952.
Nottebohm, 2,719,806, Oct. 4, 1955.

Evans discloses a semistiff collar which is made from a laminated fabric consisting of two layers, at least one of which may be a matted fabric such as paper or felt. They are bonded together by polyethylene having a molecular weight of at least 6000. Although Evans apparently prefers to employ a continuous film of polyethylene for his purposes, the patent states that the polyethylene may be applied to the surface of one of the layers in the form of an aqueous suspension or emulsion by any convenient means such as spraying or brushing.

Schramm teaches a method of making a stiffened and permeable resin-coated laminated fibrous sheet which is useful in the making of a collar stock. The laminated fibrous sheets may be made by coating a textile fabric or a fibrous sheet material, such as paper or felt, with discrete particles of a thermoplastic material, such as the vinyl resins, and laminating the coated sheet with another sheet. The product of Schramm is stated to be permeable to air and moisture.

Nottebohm discloses a process for the manufacture of a porous and air-permeable sheet material which may be used in the manufacture of shirt collars and other garments. The sheet of Nottebohm is made of polyposed fibers impregnated with binder particles which cement the fibers together at their crossing points. The impregnated sheet can be adhered to fabrics by hot ironing and it constitutes a suitable stiffening material for shirt collars. This reference was cited to show the non-woven fabric in the claims on appeal.

The Examiner rejected all the claims as "unpatentable over" [3] Schramm in view of Evans and Nottebohm. He considered that Schramm fails as a "complete anticipation" only in that the reference does not specify the particular non-woven fabric and the thermoplastic particles claimed. However, the Examiner regarded it to be an obvious expedient to use the non-woven fabric of Nottebohm in place of the felt of Schramm and to substitute the thermoplastic material of Evans, polyethylene, for the thermoplastic vinyl resins of Schramm. The Examiner additionally rejected all of the claims as "unpatentable over" Evans in view of Nottebohm. In this respect, the Examiner considered it to be obvious to use the particular non-woven fabric of Nottebohm for the felt of Evans.

The Board sustained the Examiner's rejections and found the

[3] There is no question in the present case that the rejection is one of obviousness within the meaning of 35 U.S.C. 103.

claimed range of 5 to 50 grams per square yard deposition rate not to be disclosed as critical.

During the proceedings below, Dr. Robert Schabert, one of the appellants herein, submitted an affidavit in an attempt to show the criticality of the molecular weight and amount of the claimed polyethylene particles. It appears from the affidavit that polyethylene having a molecular weight higher or lower than the range recited in the appealed claims is unsuitable for the present purpose. Additionally, the affidavit shows that (1) the adhesiveness between the non-woven fabric and the second fabric is very poor when only 3 grams of polyethylene are used per square yard of fabric, and (2) the breathing properties and stiffness of the fabric are poor when more than 50 grams of polyethylene are used per square yard of fabric.

The Examiner and the Board found the affidavit unconvincing. As to the molecular weight of the polyethylene, the Examiner and the Board pointed out that the polyethylene of Evans is specified to have a molecular weight of at least 6000 and even if Evans is restricted to the only specific molecular weight recited, the appellants' range of 5,000 to 70,000 represents no departure therefrom. As to the amount of polyethylene used, the Examiner noted that the claimed range defines the limits of suitable adherence and permeability for a particular product and that this is a matter of choice. The Board's position on the alleged criticality of the amount of polyethylene is that this factor was not disclosed as critical nor shown to be "universally critical to base fabrics of any and every thickness."

After a careful consideration of the record, we are of the view that the Board's conclusion as to obviousness is supported by the facts of record and therefore it must be affirmed.

[1] Schramm discloses a laminated and moisture-permeable collar stock made by laminating two sheets of textile fabrics together, using as the binder thereinbetween a thermoplastic vinyl plastic. This is basically the type of products appellants are claiming. True, appellants use a particular sheeting material and a particular thermoplastic resin not shown in Schramm. However, these particular materials are clearly disclosed in the secondary references. In view of the fact that all three references are directed to the art of making a collar stock and the fact that the specific materials disclosed in the secondary references are employed for substantially the same purposes as those of the corresponding materials in Schramm, we find no error in the manner in which these references are combined. In this regard we note that though Evans prefers to use a film of polyethylene as the binding material, the patent does disclose the coating of a fabric surface by spraying or brushing an aqueous suspension or emulsion of polyethylene which, as the Examiner has suggested, may result in a particulate deposit. In any event, Evans was not specifically concerned with a moisture and air-permeable product whereas Schramm is specifically directed to the manufacture of such a product. We are of the opinion that, given the need for such a permeable product, it would be obvious to modify the layer of bonding material of Evans to that shown by Schramm.

[2] We are also not persuaded by the affidavit of Schabert. Appellants' claimed range of molecular weight is inclusive of one specific number disclosed in Evans. As to the amount of the binder resin to be used, we find the appellants' claimed range to be obvious within the meaning of 35 U.S.C. 103. Once the desired objective or producing

a moisture and air-permeable collar stock is stated, the amount of polyethylene binder to be used in such a product seems to us to be susceptible to routine experimental determination, absent some unforeseeable difficulty.

[3] Appellants contend that the method of Schramm, when carried out with the polyethylene particles would cause a binder deposit of about 80 grams per square yard, thus resulting in a product which is too stiff and unsuitable. We note, however, that there is no claim that appellants' method of depositing the polyethylene particles is unique or unobvious, and that the claims are not directed to the method of such deposition. There is no showing that once the optimum amount of polyethylene to be used has been determined, that amount cannot be deposited onto the sheet materials by an obvious method.

[4] The decision of the Board is affirmed.

AFFIRMED.

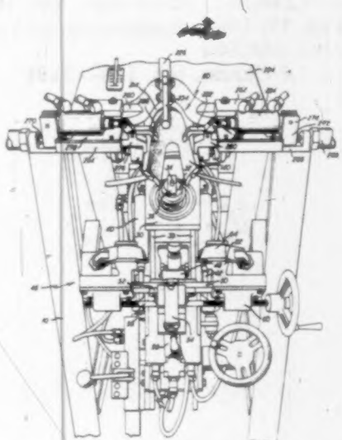
LASTING MACHINE HAVING COOLED CLAMP

Jacob Simon Kamborian, 70 Crestwood Road, West Newton, Mass. 02165, and Michael M. Becka, Cambridge, and Robert B. Dunlap, Medway, Mass.; said Becka and said Dunlap assignors to said Kamborian

Original No. 3,228,046, dated Jan. 11, 1966, Ser. No. 262,874, Mar. 5, 1963. Application for reissue Aug. 4, 1966, Ser. No. 607,334

22 Claims. (Cl. 12—10.5)



1. In a lasting machine having means for supporting a last having an insole on its bottom and an upper mounted thereon with a stiffener interposed between a portion of the upper and the last, said stiffener being stiff and rigid at ambient temperatures, becoming flaccid and moldable when heated a predetermined amount above ambient tempertures and reverting to its stiff and rigid state when cooled back to ambient temperatures; clamping means actuable to clamp the said portion of the upper against the last; and means for wiping the margin of said portion of the upper against the insole, the improvement comprising: means for causing said clamping means to be cooled below ambient temperatures *while said clamping means is in clamping engagement with said portion of upper* to thereby cool the stiffener and decrease the time for the stiffener to revert to its stiff and rigid state.

26,356

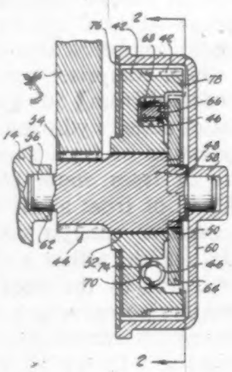
WINDOW LIFT GEAR

Joseph Pickles, Bloomfield Hills, Mich., assignor to Ferro Stamping Company, Detroit, Mich., a corporation of Michigan

Original No. 3,208,298, dated Sept. 28, 1965, Ser. No. 240,275, Nov. 27, 1962. Application for reissue July 12, 1967, Ser. No. 661,144

9 Claims. (Cl. 74—411)

7. A yieldable coupling comprising a worm gear having a recess in one side thereof, a pinion member positioned within and extending out of the worm gear, and resilient means within said recess operable between the worm gear and pinion member for transmitting torque therebetween.



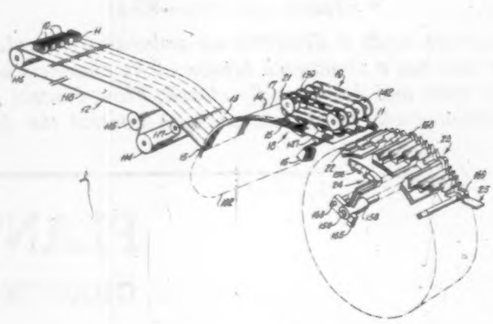
26,357

METERING APPARATUS

Arthur J. Griner, Wyckoff, and Robert J. Albrecht, River Edge, N.J., assignors to National Biscuit Company, a corporation of New Jersey

Original No. 3,086,334, dated Apr. 23, 1963, Ser. No. 68,928, Nov. 14, 1960. Application for reissue Feb. 26, 1964, Ser. No. 377,147

41 Claims. (Cl. 53—26)



Method and apparatus for automatically handling articles, such as fig bars and similar baked goods, wherein the lead articles are stripped one at a time from each of a plurality of columns or stacks in rotation, formed into rows of spaced articles in staggered relation, and then consolidated into a single column of articles on a rotating drum. The resulting column is successively stripped from the drum with the articles in stacked-on-edge, close-column relation, mechanically metered into spaced groups of equal numbers of articles, and conveyed to continuous packaging apparatus.

26,358

SINGLE-STAGE HYDROCRACKING PROCESS WITH A NITROGEN CONTAINING FEED STOCK

Robert J. White, Pinole, Calif., assignor to Chevron Research Company, a corporation of Delaware

Original No. 3,248,318, dated Apr. 26, 1966, Ser. No. 294,374, July 11, 1963. Application for reissue July 1, 1966, Ser. No. 569,765

11 Claims. (Cl. 208—111)

1. A process for the single-stage denitrification and hydrocracking of hydrocarbon feedstocks containing more than about 550 p.p.m. of nitrogen and boiling in the range from about 400° to about 1400° F. to produce at least one product fraction boiling below the initial boiling point of said feedstock, which comprises contacting said feedstock, along with *at least* [from] 500 [to 2000] standard cubic feet per barrel of added hydrogen, in a hydrocracking zone at a temperature of from about 650° to about 950° F., a pressure of from about 800 to about 3000 p.s.i.g. and an L.H.S.V. of from about 0.1 to about 10.0 with a nitrogen-insensitive catalyst comprising at least one Group VI metal sulfide within a silica-alumina gel, said catalyst manufactured by the steps comprising:

(a) forming a mixture comprising a silica sol, at least one soluble aluminum compound, and at least one soluble compound of a Group VI metal;

(b) reacting said mixture formed in step (a) with a quantity of an epoxy compound sufficient to convert said mixture into a hydrogel;

(c) dehydrating said hydrogel to produce a gel comprising silica, alumina and at least one Group VI metal oxide; and

(d) converting said Group VI metal to its corresponding sulfide by contact with a sulfur-containing fluid.

26,359

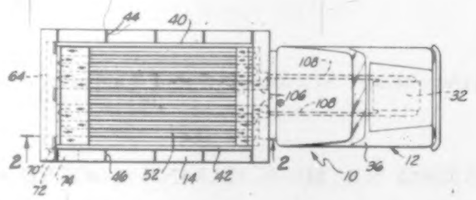
TRUCK UNLOADING STRUCTURE

Fred Thompson, 1402 N. Linwood, Santa Ana, Calif. 92701

Original No. 3,272,358, dated Sept. 13, 1966, Ser. No. 355,612, Mar. 30, 1964. Application for reissue Jan. 25, 1967, Ser. No. 617,431

9 Claims. (Cl. 214—83.2)

The truck body is designed for unloading granular materials and has a channeled bottom. The channels are upwardly open and downwardly closed. Flow control means is positioned above the channels to control the flow of granular material into the channels. A flexible conveyor unit is positioned in each channel so that upon motion of



the conveyor units, the granular material is discharged from the truck body.

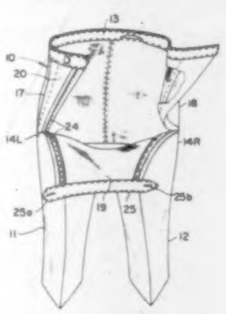
26,360

WEARING APPAREL WITH BODY-CONFORMING INNER PANEL

Ralph R. Pagano, 118 87th St., Brooklyn, N.Y. 11209

Original No. 3,246,342, dated Apr. 19, 1966, Ser. No. 345,979, Feb. 19, 1964. Application for reissue Dec. 22, 1966, Ser. No. 606,504

4 Claims. (Cl. 128—519)



A wearing apparel is disclosed having a body portion in the region of the waistline to just below the hips comprising a front panel and a rear panel with seams connecting the front and rear panels together along the sides thereof extending from the waistline to below the hips. The front panel has an inner front panel of elasticized material extending across the back thereof, said inner front panel of elasticized material extending from the waistline to just below the hips and being sewn along its sides under transverse tension to the back of the front panel. An inner rear panel of elasticized material extends across the back of the rear panel, the rear panel also extending from the waistline to just below the hips and being sewn while under transverse tension to the back of the rear panel and down along the sides thereof.

PLANT PATENTS

GRANTED MARCH 5, 1968

Illustrations for plant patents are usually in color and therefore it is not practicable to reproduce the drawing.

2,797

PEACH TREE

Charles Preuss, 8690 N. Minnewawa, Clovis, Calif. 93612

Filed Nov. 21, 1966, Ser. No. 596,022

1 Claim. (Cl. Plt.—43)

1. A new and distinct variety of peach tree substantially as illustrated and described and which is characterized by its vigorous growth and its regular and heavy bearing of freestone, darkly red skinned, firm textured, yellow-fleshed peaches which ripen about ten days earlier than the fruit of the Fay Elberta (unpatented) peach tree, about ten days later than the fruit of its parent Suncrest (unpatented) peach tree, and at about the same time as the fruit of the Merrill 49er (unpatented) peach tree from which varieties of peach trees the instant variety distinguishes in its relatively larger, generally more uniformly round fruit having a smoother distinctive darkly red lined suture with its skin being more darkly red colored and distributed over a larger portion of the skin and which contains a stone having a pointed tip transversely offset from its longitudinal axis.

2,798

CAMELLIA PLANT

James Howard Asper, Escondido, Calif., assignor to Select Camellias, Inc., Whittier, Calif., a corporation of California

Filed Sept. 8, 1966, Ser. No. 578,106
1 Claim. (Cl. Plt.—62)

1. A new and distinct variety of camellia plant substantially as herein shown and described, characterized particularly as to novelty by its large semi-double type blooms that are predominantly Blood Red in color shading to Cardinal Red and having a pronounced fluorescence, by its orbiculate petals with the apex retuse, by its substantially black stamens when these are mature, by its large, very dark green leaves that are heavy, thick and waxy and have serrated margins, and by its vigorous, upright spreading growth habit.

2,799

ROSE PLANT

Gijsbert de Ruiter, Hazerwoude, Netherlands, assignor to Carlton Rose Nurseries, Inc., Carlton, Oreg., a corporation of Oregon

Filed July 21, 1966, Ser. No. 567,036
1 Claim. (Cl. Plt.—22)

1. A new and distinct variety of rose plant of the floribunda class, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of attractive shiny and glossy foliage, strong and upright flower stems, with little or no "Blind" wood, a distinctive and attractive general color tonality of the flowers corresponding to burnt orange and gold in the opening stage, changing to pink as the flowers fully open and mature, very long keeping qualities of the flowers both on the bush and as cut flowers; and good shipping qualities.

PATENTS

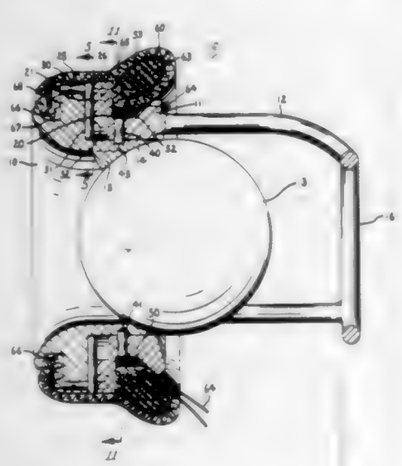
GRANTED MARCH 5, 1968

GENERAL AND MECHANICAL

3,371,351
BELT FOR TROUSERS
Maurice Allain, 11 Blain St., Acushnet, Mass. 02743
Filed Jan. 18, 1967, Ser. No. 610,078
4 Claims. (Cl. 2—338)

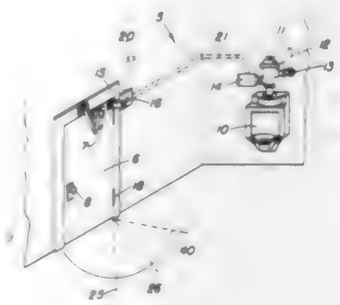
A belt comprising two sections with a rope of substantial length connecting the ends of the two sections around the back of the body to provide a storage for an extended length of rope which may be detached for some additional usage. The two sections are detachably connected in the front in any conventional manner.

3,371,352
HEART VALVE FOR QUICK IMPLANTATION HAVING PROVISION FOR INGROWTH OF TISSUE
George G. Siposs, Garden Grove, Donald A. Raible, Corona, and Donald J. Bentley, Newport Beach, Calif., Albert Starr, Portland, Oreg., and Miles Lowell Edwards, Santa Ana, Calif., assignors to Edwards Laboratories, Inc., Santa Ana, Calif., a corporation of California
Filed Jan. 19, 1965, Ser. No. 426,613
18 Claims. (Cl. 3—1)



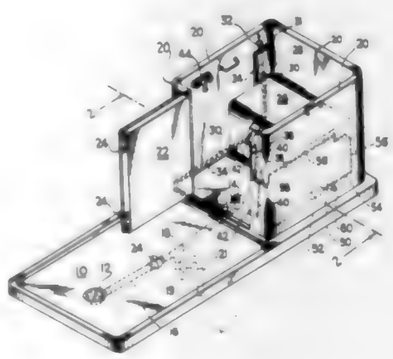
A heart valve having needle fixation in combination with an upholstered suturable cuff. The needles are pivotally mounted to swing in a common radial plane and have arcuately curved shanks concentric with their pivotal axes to avoid a sweeping motion as they penetrate the patient's tissue. The needles are projected by an epicycloidal cam on a rotatable ring in the valve.

3,371,353
DOOR CONTROLLED AUTOMATIC FLUSHING SYSTEM
Jacques J. Filliung, Chicago, Ill., assignor to Sloan Valve Company, Chicago, Ill., a corporation of Illinois
Filed Oct. 13, 1965, Ser. No. 495,444
5 Claims. (Cl. 4—99)



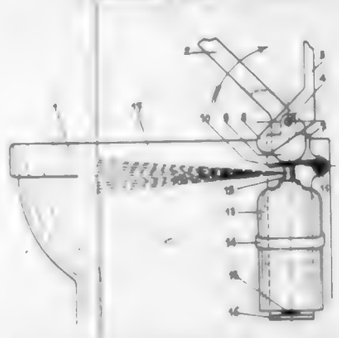
A flushing arrangement for urinals in which the flush valve is automatically operated by a door switch only when a person exits from the toilet room after having used the urinal. Toilet room doors are opened up much wider when a person goes out of the room than when he enters it.

3,371,354
WALK-IN BATHTUB
Vetra M. Hayslett, 315 E. Union, Walbridge, Ohio 43465
Filed Mar. 25, 1966, Ser. No. 537,465
5 Claims. (Cl. 4—173)



1. A bathtub comprising a horizontal base having a drain opening having means mounted therein for opening and closing same, four vertical walls interconnected to each other and extending upward from the base to define a bathing chamber open at the top, said walls in cross section defining the closed perimeter of a rectangle, said chamber having a horizontal seat therein, a manually operable pull member secured to the interior of one wall and accessible both from inside and outside said chamber, and a linkage connecting said member to said means whereby manual operation of said member can open and close said drain opening.

3,371,355
HINGED AEROSOL ACTUATOR ELEMENTS FOR SANITARY FLUSH BOWL
Edouard L. Wipf, Geneva, Switzerland, assignor to Anstalt für Patentankauf, Vaduz, Liechtenstein
Filed Oct. 7, 1964, Ser. No. 402,361
Claims priority, application France, Dec. 12, 1963, 956,976
6 Claims. (Cl. 4—222)



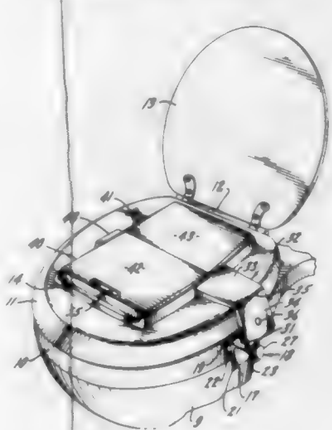
1. In a sanitary installation including a flush-bowl, a seat and a cover over said seat, means hingedly connecting said seat and cover to said flush-bowl for pivotal movement about a common axis from closed position where said seat and cover lie over said flush-bowl to open position where they stand generally upright, the improvement in the combination comprising:

(a) a pressurized container having a nozzle-plug normally biased to inoperative position, said nozzle-plug depressible along the axis of said container to operative position thereof;

(b) a cam member on each of said seat and cover adjacent said hinged ends and offset from said common axis to be displaced about said axis when either of said seat and cover is pivoted, and

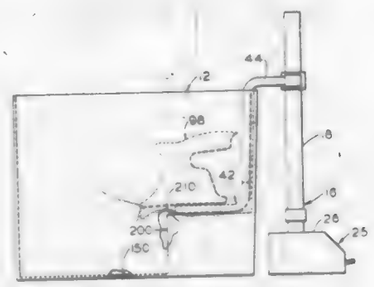
(c) means operable by either of said cams to actuate said nozzle-plug of the container in a rectilinear motion causing operation thereof only when either of said seat and cover stands about mid-way between said closed and open position and vice versa.

3,371,356
CHILD'S TOILET SEAT ASSEMBLY
E. Burton Benjamin, Highland Park, Ill., assignor, by mesne assignments, to Loma Industries, Inc., Cleveland, Ohio, a corporation of Ohio
Filed May 24, 1965, Ser. No. 457,944
5 Claims. (Cl. 4—239)



The instant article of manufacture is a compactly foldable child's toilet seat which is demountably clamped to the rim of a conventional toilet bowl. In usage the child's toilet seat rests on the seat of the conventional toilet bowl. When not in use, the child's toilet seat can be swung as an inconspicuous, slim rectangular package, into a hanging position by the side of the toilet bowl; alternatively it can be quickly unclamped for storage out of sight.

3,371,357
BATH LIFT
Calvin R. Berthelsen and Owen W. Berthelsen, Lincoln, Nebr., assignors to Century Mfg. Co., a corporation of Nebraska
Filed May 10, 1965, Ser. No. 454,540
3 Claims. (Cl. 5—83)



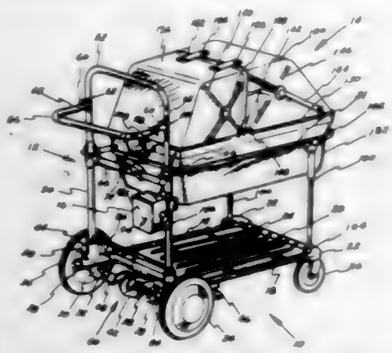
1. A bath lift having a vertically extending elongated hydraulic cylinder means, means for anchoring the base of said hydraulic cylinder to a supporting surface, a motorized pump assembly, means hydraulically operably interconnecting said pump assembly and said hydraulic cylinder means, lift arm means attached to said hydraulic cylinder means so as to be movable thereby upwardly and downwardly, said lift arm means having a first portion extending laterally from said hydraulic cylinder means and having a second portion connected to said first portion and extending downwardly therefrom, a seat, means mounting said seat on the lower end of said lift arm means comprising mutually engageable and releasable interlocking means having first portions mounted on said lift arm means and having second portions, a lift frame, the second interlocking means being connected to said lift frame, said lift frame having a portion extending beneath said seat, and means attaching said seat rotatably to said lift frame for the rotation of said seat on said lift frame about a vertical axis, said seat rotatable attaching means being separate and distinct from said mutually engageable and releasable interlocking means for independent action so that said mutually interlocking means can be engaged and released without interfering with said rotating means, whereby at times when said interlocking means are interlocked said lift frame and seat can be lifted by said lift arms, and whereby at times when said mutually interlocking portions are not interlocked, said seat and its lift frame are disposed free of said lift arms and are adapted to be supported by other means.

3,371,358
ROCKING CRADLE
Joseph T. Shackel, 14636 Bringard, Detroit, Mich. 48215
Filed Feb. 3, 1967, Ser. No. 613,906
8 Claims. (Cl. 5—108)

A crib unit supported on a wheel bearing chassis for self-rocking movement relative to the chassis. A motor provides a source of motion to the crib unit through a semi-rigid link. The link provides a motion transmitting connection from the motor to the crib when the crib is in a balanced condition. However, the link in response to a predetermined force opposing the motion of the crib about its axis, assumes a non-rigid connection between the motor and the crib.

The crib unit is mounted at a selectively variable height to the chassis by a horizontal tubular support mem-

ber having a pair of locking elements interengageable in sockets provided in a pair of upright supports. A lever

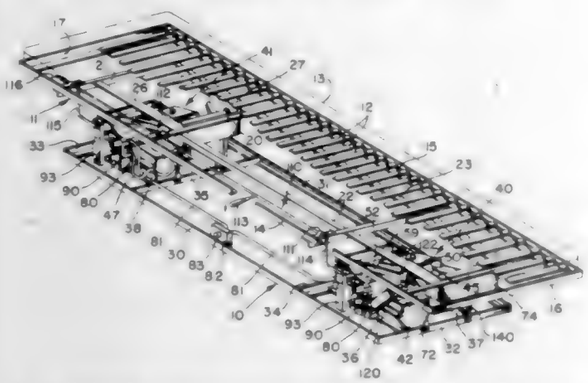


member is operable to actuate the locking elements into a disengaged position with respect to their sockets upon the release of a safety latch.

ERRATUM

For Class 5—83 see:
Patent No. 3,371,357

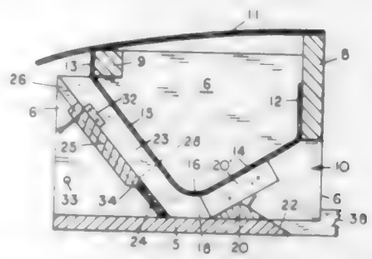
3,371,359
MATTRESS SUSPENSION SYSTEM
Edwin C. Dome, Lucas, Ohio, assignor to Artnell Company, Chicago, Ill., a corporation of Delaware
Filed Sept. 22, 1966, Ser. No. 581,324
9 Claims. (Cl. 5—118)



1. A mattress suspension system and the like comprising a lower frame, an upper frame adapted to receive and support a mattress or the like, at least two fluid suspension units operatively connected between said lower and upper frames for vertically controlling the position of the latter relative to the former, each of said fluid suspension units including an air spring, valve means carried by said lower frame for each suspension unit controlling the fluid pressure within said air springs, and single control means accessible to a person reclining on said mattress for actuating said valve means simultaneously to automatically vertically adjust said upper frame depending upon the weight of the person thereby to provide controlled, level movement of said upper frame relative to said lower frame.

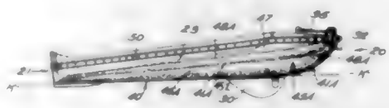
3,371,360
BEEHIVE EXIT DEVICE
Lucille S. Antles, P.O. Box 1243, Wenatchee, Wash. 98801, and Wallace Eugene Parsons, Wenatchee, Wash.; said Parsons assignor to said Antles
Filed Mar. 4, 1966, Ser. No. 531,993
3 Claims. (Cl. 6—4)

1. A beehive exit device for use in improving pollination of plant blossoms comprising a bottom, end walls, a rear wall and a front cross bar defining an exit enclosure, said rear wall being of less width than the end walls to provide an opening adpated to register with the bee inlet and outlet opening of a beehive, a longitudinally extending pollen chamber on the bottom of said exit enclosure, a narrow inclined bee exit passageway extending upwardly and outwardly from said pollen chamber, said passageway being formed by a pair of spaced apart parallel upwardly inclined walls extending from said pollen chamber, the lowermost wall of said passageway forming a bee exit floor, a portion of said bee exit floor



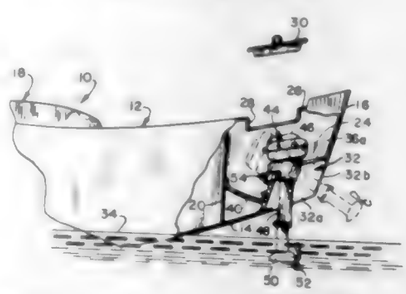
adjacent the pollen chamber being a narrow strip of light conductive material, the remaining portion of said bee exit floor forming a pivotally supported ramp means, the axis of which is adjacent and parallel to the upper edge of said light conductive strip, stop means on at least one of said end walls to limit the upward movement of said ramp and readily releasable means adapted to support said ramp in substantially the same plane as the light conductive strip whereby said ramp can be lowered into a position which affords ready access to the pollen chamber for the introduction of pollen therein.

3,371,361
WATERCRAFT
Walter Andersen, Ottawa, Ill., assignor of one-fifth to W. Russell Bone and one-fifth to John W. Fisher, both of Muncie, Ind.
Filed Oct. 22, 1965, Ser. No. 500,603
9 Claims. (Cl. 9—6)



A watercraft suited for towing is provided with a hull having a bottom fore-an-aft cavity flanked by two coextensive bilges which also run the length of the craft. There is located within the fore-and-aft cavity steering means including a rudder, said rudder being located forward of amidship and aft of the bow.

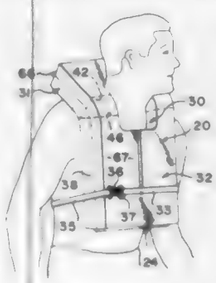
3,371,362
ADJUSTABLE OUTBOARD WELL
Frank W. Butler, 10354 Vanalden, Northridge, Calif. 91324
Filed Jan. 24, 1966, Ser. No. 522,616
4 Claims. (Cl. 9—6)



The adjustable outboard well has upright wall means defining a motor wall opening through the bottom wall of the hull and the transom. A bulkhead extends

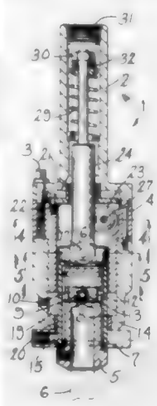
across the compartment forwardly of the motor well and a floor extends between the bulkhead and the wall means of the motor well for collection of water. The floor is above the bottom wall of the hull and slopes toward a drain outlet just above the floor.

3,371,363
LIFE VEST AND METHOD OF MAKING SAME
Joseph H. Le Blanc, Jr., New Orleans, La., assignor, by mesne assignments, to Tapatco, Inc., Fairfield, Calif., a corporation of Nevada
Filed Aug. 11, 1965, Ser. No. 478,904
31 Claims. (Cl. 9—333)



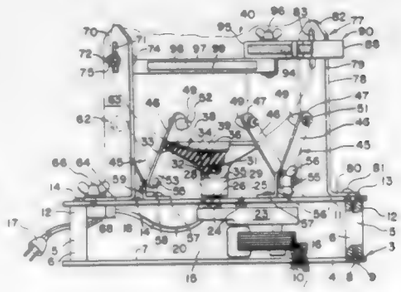
This disclosure relates to life vests and the method of making a life vest by providing a sheet of buoyant material which is of predetermined size and configuration, and cutting that sheet of buoyant material into desired material portions, which portions comprise life vest components, with none of the buoyant material being wasted. The buoyant material portions have been arranged to provide a vest chest portion and a vest neck portion, with a head opening therebetween. The opening may be of keyhole configuration, and may terminate short of the bottom of the vest. The vest is then covered with a suitable covering material which provides a hinging effect at junctures of the various portions of buoyant material.

3,371,364
TOOL HOLDER
Lloyd D. Johnson, Portland, Conn., assignor to Telco Corporation, Hartford, Conn., a corporation of Connecticut
Filed Oct. 11, 1965, Ser. No. 494,650
4 Claims. (Cl. 10—129)



This invention relates to a tapping or threading tool holder for use on a turret lathe or other machine tool, having a rotating head or chuck by which the workpiece may be rotated in either direction. In particular, this invention is directed to a tool holder comprising in combination a housing, a spindle mounted in said housing for rotation therein, a chuck for holding a tool, at least a portion of said chuck mounted in said spindle for movement therewith, means formed in said housing and coacting with means cooperating with said spindle for permitting the spindle to move in a direction parallel to its axis and to selectively rotate within said housing depending upon the position of the spindle in the housing, a longitudinal slot defined in a portion of said spindle, a shaft supported by said housing, and a pawl slidably mounted on said shaft, said pawl having a portion thereof positioned to engage said longitudinal slot and said pawl constructed such that the spindle may rotate in a first direction and be prevented from rotating in a direction opposite to the first direction.

3,371,365
PORTABLE BOWLING BALL CLEANER
Otto F. Falckenberg, 3721 N. Greenview Ave., Chicago, Ill. 60613
Filed Mar. 16, 1965, Ser. No. 440,267
9 Claims. (Cl. 15—97)



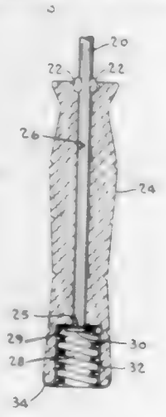
A portable bowling ball cleaner having a ball support with a vertical spindle upon which is mounted a suction cup and a curved ball encompassing wiper mounted over the ball and yieldable rubber bumpers disposed about the ball to prevent the ball from falling off the cup when the ball is rotating and serving to facilitate removal or placement of the ball with respect to the support.

3,371,366
MOP HOLDER HAVING A UNIVERSALLY ADJUSTABLE HANDLE
Harold E. Ottensmeier, 14109 Ardis St., Bellflower, Calif. 90706
Filed Nov. 16, 1964, Ser. No. 411,248
2 Claims. (Cl. 15—144)

2. In a mop holder, a substantially flat base plate, means for attaching a mop to said base plate, an inverse U-shaped bracket disposed above said base plate, the opposite ends of said bracket being pivotally mounted with respect to said base plate along a horizontal axis of pivotal movement, said bracket having an integral center portion twisted at a right angle to extend radially with respect to the axis of pivotal movement of said bracket, a

handle disposed above said bracket, and a pivot member connecting the lower end of said handle to said center portion of said bracket on a horizontal axis of pivotal movement transverse to the axis of pivotal movement of said bracket, whereby manipulation of said handle provides universal swivel action of said handle with respect to said base plate.

3,371,367
HANDLE FOR PAINT ROLLER
Louis Tigerman, Milwaukee, Wis., assignor to Bestt Roller Inc., Fond du Lac, Wis., a corporation of Wisconsin
Filed Oct. 6, 1965, Ser. No. 493,520
4 Claims. (Cl. 15—145)

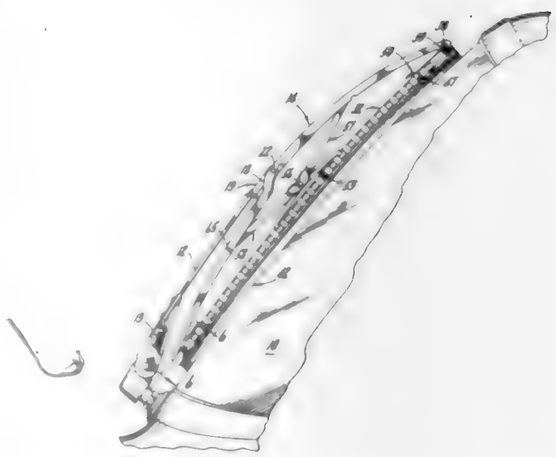


This invention comprises a metal frame for a paint roller or the like which has a solid metal portion on which a frangible handle is carried. The solid metal portion extends through such frangible handle and an internally threaded metal socket is rigidly secured to the end of such solid portion. When an extension is fitted in such socket the strain is transmitted directly to such metal portion and not to such frangible handle.

3,371,368
WINDSHIELD WIPER
Harold Lloyd Walker, P.O. Box 185, Finch, Ontario, Canada
Filed May 24, 1965, Ser. No. 457,981
5 Claims. (Cl. 15—250.04)

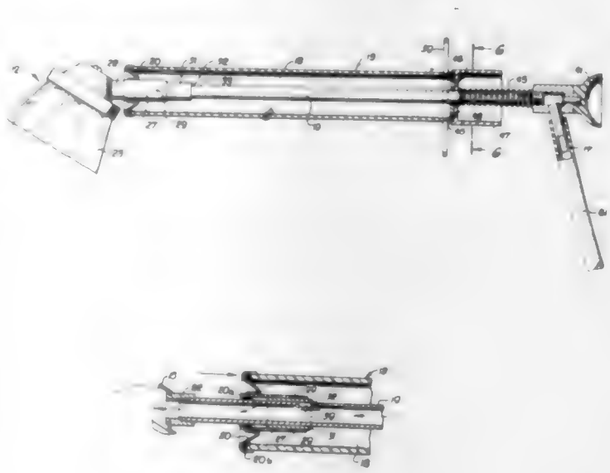
This specification discloses a windshield wiper comprising a blade, a blade support that is inflexible in the direction of blade travel but flexible in a direction normal to blade travel, a drive connected to the support for causing reciprocating travel of the blade over a windshield, structure carried by the blade support and providing a gas impervious cavity; and means to introduce gas under pressure into said cavity to flex said blade support and cause said blade to conform to a windshield.

3,371,369
WINDSHIELD WIPER
Ralph H. Wise, % Arvin Industries, Inc., Columbus, Ind. 47201
Filed July 28, 1965, Ser. No. 475,447
16 Claims. (Cl. 15—250.42)



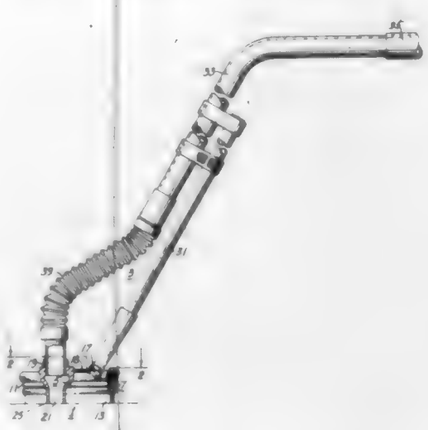
A windshield wiper assembly for wiping a curved surface comprising an elongated flexible wiper attached at its ends to a relative rigid elongated bow structure and link means carried intermediate the ends of the bow structure to apply pressure to the wiper intermediate its ends.

3,371,370
DISHWASHING APPARATUS
Edward J. Feser, 8862 Arcadia Ave., San Gabriel, Calif. 91775
Filed Oct. 22, 1965, Ser. No. 501,730
6 Claims. (Cl. 401—46)



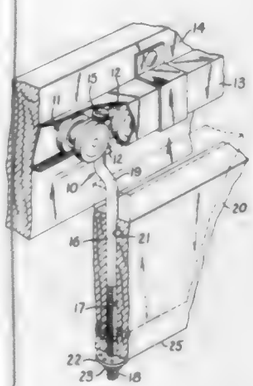
A hand operated dishwashing apparatus which is adapted to be attached to a source of water and which includes a reservoir of detergent. The apparatus further includes manual control means for positioning within the apparatus and discharging a predetermined amount of detergent into a stream of water adjacent a brush portion of the dishwashing apparatus.

3,371,371
PICK-UP TOOL ASSEMBLY
Ettore Steccone, 8416 Ney Ave., Oakland, Calif. 94605
Filed Jan. 18, 1966, Ser. No. 521,350
4 Claims. (Cl. 15—402)



A pick-up tool assembly involving a vacuum head maintained in proper engagement with a surface to be cleaned, by connecting same to a squeegee, with leaf springs, to which springs is hinged a handle.

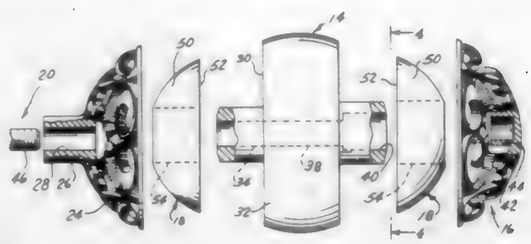
3,371,372
SLIDING DOOR HARDWARE
George Banse, Sterling, Ill., assignor to National Manufacturing Co., Sterling, Ill., a corporation of Illinois
Filed Jan. 12, 1966, Ser. No. 520,185
6 Claims. (Cl. 16—105)



A rod has its upper end attached to a track follower and its lower end offset and passing through a cross-piece at the top of the door, the lower end of the rod having a non-circular threaded cross-section. A washer with a matching non-circular section is positioned around the lower end of the rod and nailed to the bottom of the cross-piece to prevent the rod from turning in an angular direction once it has been positioned to space the door a suitable distance from the doorway. A nut is threaded underneath the washer to support the door vertically.

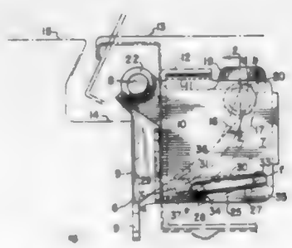
3,371,373
DECORATIVE MODULAR KNOB ASSEMBLY FOR DRAWERS, DOORS, CABINETS, AND THE LIKE
Matthew M. Adams, Arcadia, Calif., assignor, by mesne assignments, to Travis Plating Co., Inc., a corporation of California
Filed Apr. 16, 1965, Ser. No. 448,750
2 Claims. (Cl. 16—121)

A decorative modular pull or knob for drawers, cabinets, and the like, having multiple parts which may be assembled in various combinations to alter the size and appearance of the knob and include interchangeable colored



inserts visible through ornate openings in certain of the parts.

3,371,374
DOOR HINGE EMBODYING TORSION BAR HOLD-OPEN MEANS
Joseph H. Marchione, Rockford, Ill., assignor to Atwood Vacuum Machine Company, Rockford, Ill., a corporation of Illinois
Filed Aug. 11, 1966, Ser. No. 571,818
10 Claims. (Cl. 16—145)

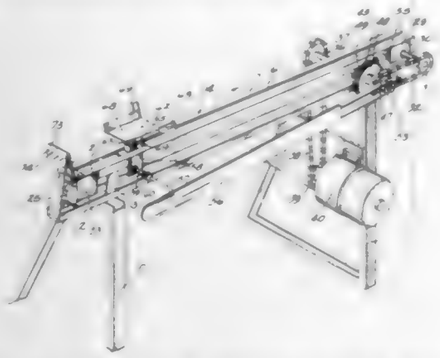


This hinge has a scalloped roller as a striker mounted on a vertical pin for rotation relative to one of the hinge members, the other hinge member carrying a vertical torsion bar with the upper end bent in a semi-circle to provide a laterally extending arm with a substantially vertical detent portion projecting from its outer end, which is supported on the hinge member independently of the other hinge member so as to maintain a preload spring tension, the detent portion being disposed in the path of arcuate movement of the striker roller and movable relative to the torsion bar by deflection of said arm by said roller in a direction to increase the spring tension in said bar when said roller comes into engagement with said detent in the door opening and closing movements for a hold-open action in fully open position, the scalloped periphery of the roller causing the detent to drop into a scallop upon each engagement, thereby forcing the roller to turn through a certain angularity in each movement of the roller past the detent. Friction means resist turning of the roller so that the same scallop is engaged by the detent in each operation in the door opening and closing operation, until the roller is turned to a new position. The other end portion of the torsion bar serves by engagement with a stop on the other hinge member to limit the door opening movement positively after the detent passes the roller.

3,371,375
MACHINES FOR AIDING IN SKINNING SMALL ANIMALS
Joseph J. Bartel, R.R. 2, Box 70, New Holstein, Wis. 53061
Filed Oct. 19, 1965, Ser. No. 497,963
5 Claims. (Cl. 17—21)

A machine for removing the skin from animals includes an elongated frame which supports sprocket wheels and an endless pull chain driven by an electric motor. The frame also includes slideways for guiding movement of a carriage which is engageable with the pull chain. The body

of the animal is attached to one end of the frame and flaps of skin from the rear legs are attached to ears on the carriage. Movement of the carriage to strip the skin from



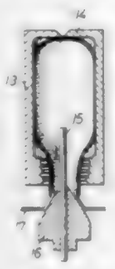
the body in the form of a tube with the fur on the inside is accomplished by leaning against a lever which extends longitudinally of the frame to engage a friction clutch and drive the pull chain.

3,371,376

APPARATUS FOR THE PRODUCTION OF HOLLOW OBJECTS WITH RELATIVELY WIDE OPENINGS

Stefan Fischer, Korresgarten, and Rainer Fischer, Buchbitze, both of Lohmar, Bezirk Cologne, Germany

Filed Sept. 24, 1963, Ser. No. 311,011
Claims priority, application Germany, Sept. 26, 1952, F 37,884
3 Claims. (Cl. 18—5)



1. An apparatus for the manufacture of hollow objects having a relatively wide neck opening, from thermoplastic material in workable form, comprising: means for producing an open ended tube of thermoplastic material, a divided mold to enclose said tube and thereby close one end thereof, means for introducing an expansion medium within said tube thereby blowing the same into contact with the internal cavity of said mold, means for widening a portion of said tube prior to the final blowing of the said tube into the said internal cavity, said widening means including gripping claws which are adapted to seize and expand the said tube at its open end, and a control device to control the actuation of the said gripping claws, said control device for the said gripping claws being comprised of a conical mandrel, and means to move the said conical mandrel along the direction of the longitudinal axis of the said tube whereby the axial movement of the conical mandrel will serve to radially move the gripping claws together or apart.

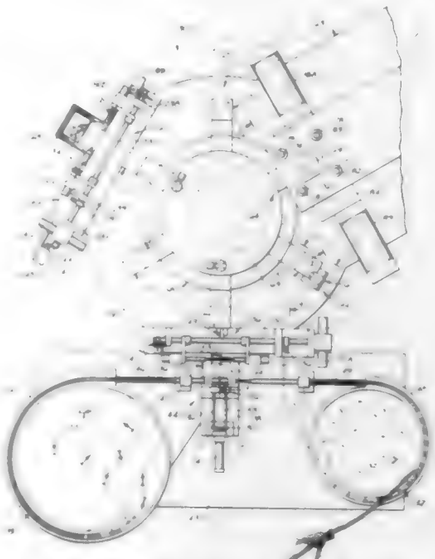
3,371,377

APPARATUS FOR MAKING COMMUNICATIONS PLUGS

Mieczyslaw Budzich, Dundalk, and William W. Cunningham, Jr., Middle River, Md., assignors to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York

Filed Jan. 20, 1966, Ser. No. 521,898
10 Claims. (Cl. 18—5)

An apparatus for assembling communications plug elements and for insulating the plug elements electrically from each other to form a plug. Mating plug elements are preassembled automatically at an assembly station and are transferred automatically into one of a plurality of molds arranged radially on an indexable turntable. The turntable



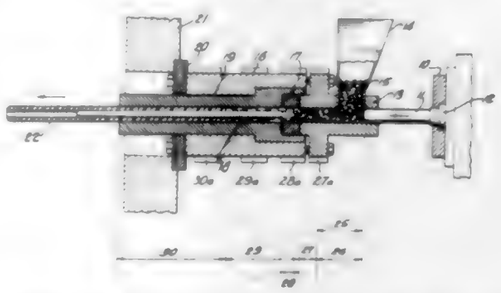
is indexed to a molding station whereat an insulating compound is injected into the mold and between the preassembled plug elements to form the plug. The turntable is again indexed where the insulating compound cures and the plug is ejected at an unloading station.

3,371,378

APPARATUS FOR PRODUCING EXTRUDED TUBES COMPOSED OF EXTRUDABLE THERMOSETTING RESINS CONTAINING REINFORCING FIBERS OF FINE TEXTURE

Jack J. Baier, 518 Manhasset Woods Road, Manhasset, N.Y. 11030

Original application Mar. 25, 1963, Ser. No. 267,720. Divided and this application July 28, 1966, Ser. No. 568,447
6 Claims. (Cl. 18—12)



An apparatus for producing extruded tubes composed of extrudable thermosetting resins and suitable fibers oriented for circumferential reinforcement of said tubes, said apparatus having a mandrel therein and having a support for positioning said mandrel at its inner end, and said mandrel being in the form of a ring arranged with helically arranged vanes which redirect the reinforcing fibers in a circumferential direction during the extrusion.

3,371,379

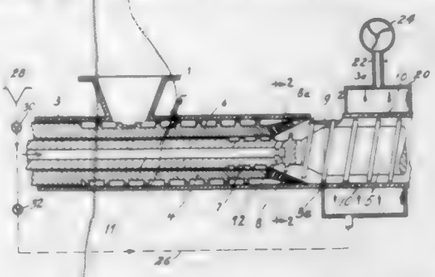
APPARATUS FOR DEGASSING THERMOPLASTIC MATERIAL IN SCREW PRESSES

Friedrich Reifenhäuser, Troisdorf, Germany, assignor to Reifenhauser K.G., Troisdorf, Germany

Filed Jan. 24, 1966, Ser. No. 522,746
4 Claims. (Cl. 18—12)

The disclosure relates to the provision of structure for removing gas in addition to that which is liberated in the

expansion zone of a rotating screw plastic extruder which comprises an elongated extension of the main discharge casing and which has a plurality of longitudinally and circumferentially spaced holes. The holes communicate with



a vacuum manifold for positively removing any liberated gases. Additional degassing means is provided by a central channel in the take-up screw which has its suction end at the expansion zone and its discharge end connected to the vacuum manifold.

3,371,380

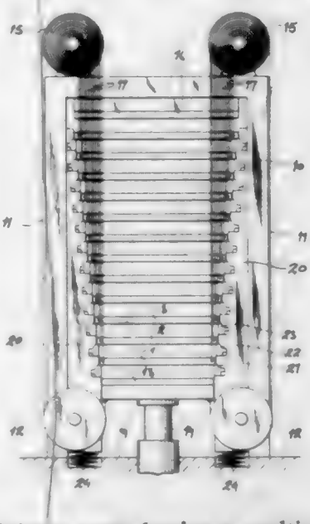
ABUTMENT DEVICE FOR THE PLATENS OF A MULTIPLATEN PRESS

Karl Bruder, Krefeld, Herbert Buschfeld, Erkelenz, and Klaus Gerhardt, Neukirchen-Vluyn, Germany, assignors to Firma G. Siempelkamp & Co., Krefeld, Germany, a corporation of Germany

Filed Dec. 15, 1965, Ser. No. 513,975

Claims priority, application Germany, Mar. 16, 1965, S 95,979

10 Claims. (Cl. 18—17)



1. In a multiplaten press having a multiplicity of vertically movable plates, the improvement which comprises an abutment device having vertically spaced horizontally offset stepped abutment surfaces individually engageable by respective platens of the press for supporting said platens in an open condition of the press, and resilient means for permitting elastic movement of said abutment surfaces upon their engagement by said platens on press-opening movement thereof.

3,371,381

APPARATUS FOR MANUFACTURING CORRUGATED OR CONVOLUTED HOSE

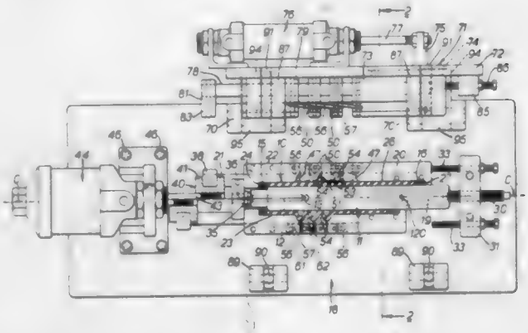
Noel Louth, Leicester, England, assignor to John Bull Rubber Company Limited, Leicester, England, a British company

Filed Mar. 10, 1965, Ser. No. 438,482

Claims priority, application Great Britain, Mar. 11, 1964, 10,300/64

6 Claims. (Cl. 18—19)

An apparatus including means for manufacturing corrugated or convoluted hose of rubber or the like in which



the walls of the hose are corrugated so as to present a wavy profile both inside and outside the hose.

3,371,382

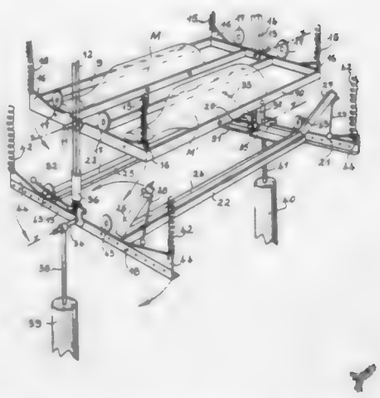
METHOD AND MEANS FOR FORMING HOLLOW ARTICLES OUT OF A SHEET OF THERMOPLASTIC MATERIAL

Pierre Alfred Ciraud, 115 Ave. Paul Firino-Martell, Cognac, Charente, France

Filed Oct. 11, 1965, Ser. No. 494,746

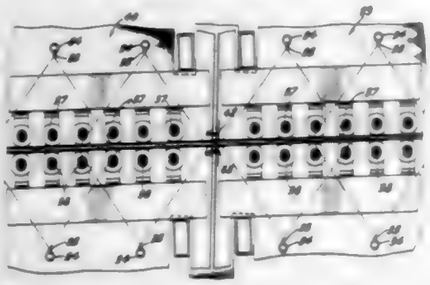
Claims priority, application France, Oct. 16, 1964, 991,803; Sept. 1, 1965, 30,029, Patent 1,457,523

12 Claims. (Cl. 18—19)



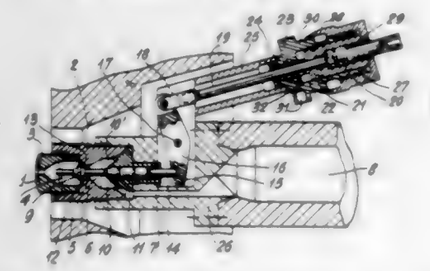
An apparatus for moulding hollow articles from thermoplastic material. There are two pivotally connected half molds which when they engage each other form a complete closed mold. Two superpositioned frames are provided which are also divided into two halves which are hingedly secured together in a line parallel to the pivoting line of the two half molds. The lower frame is adapted to hold two parallel edges of a sheet of thermoplastic material along lines parallel with the hinge of the frame and the halves of the upper frame carrying each one-half mold with it opening facing a corresponding half of the lower frame. The folding of the upper frame along its hinge engaging the half molds with each other to form a complete mold. Means are provided for heating the sheet of thermoplastic material in the lower frame to softening temperature. Means are also provided for raising the hinges of both frames to fold the latter and thereby urge the sheet on the lower frame towards the location of the inside of the mold when in its closed position and to close thereafter the mold on the upper frame over the sheet. Means are provided to make the sheet mate the inner surface of the closed mold.

3,371,383
CONTINUOUS CASTING APPARATUS
Olof H. Heilsund, Lakewood, Calif., assignor to Swedlow Inc., Garden Grove, Calif., a corporation of California
Original application Sept. 28, 1965, Ser. No. 490,897. Divided and this application Sept. 15, 1966, Ser. No. 593,621
16 Claims. (Cl. 18—26)



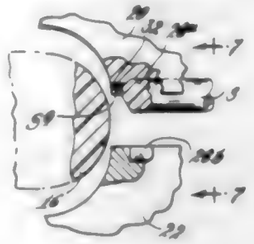
Apparatus for continuous casting of polymerizable monomers comprising a first endless belt disposed above a second endless belt to define a casting zone wherein the material-receiving end of the casting zone is at a higher elevation than the material discharging end thereof such that the belts are inclined and wherein the path of the belts through this incline is defined by the natural curvature thereof. Preferably, support means and backing means defining a path for the belts in accordance with the natural curvature thereof are provided and the upper belt is maintained under a tension greater than that used to determine the natural curvature and the lower belt is maintained at a tension less than that used to determine the natural curvature. Heating means are provided in the casting zone and seal means are provided between the edges of the belts in the casting zone. The difference in elevation between the material receiving end and the material discharging end of the casting zone is sufficient to incline the belts such that a liquid material being cast in the casting zone will develop sufficient fluid pressure to maintain the spacing between the belts such that the belts are parallel and spaced at a predetermined distance in the casting zone.

3,371,384
INJECTION VALVE PRESSURE REGULATOR
Robert Nouel, Villejuif, France, assignor to Lenslite Co., Inc., a corporation of Florida
Filed May 6, 1965, Ser. No. 453,798
14 Claims. (Cl. 18—30)



1. An injection valve pressure regulator comprising a nozzle having a chamber and adapted to introduce plastic material into a mold cavity, a pair of passages leading into and out of said chamber, valve means in said chamber including opposed seats at said passages and a valve member movable to engage said seats and close said passages, said valve member having sections of different diameter subject to pressure of plastic material being injected and responsive to the back pressure resulting from a filled condition of a mold cavity to urge the valve member against one of said seats to interrupt the flow of plastic material to said chamber, a fluid pressure device connected to said valve member, said fluid pressure device comprising a pair of pistons each slidable in a cylinder, means for applying pressure fluid to one cylinder to provide a force for urging said valve member to a position intermediate said valve seats, and means for applying pressure fluid to the second cylinder to move said valve member against said other valve seat to close the nozzle connection with the mold.

3,371,385
INJECTION MOLD ASSEMBLY WITH MEANS FOR SHEARING SPRUE FROM FINISHED ARTICLE
Anthony S. Cordio, Fitchburg, and George F. Mairle, Waltham, Mass., assignors to International Vulcanizing Corporation, Waltham, Mass., a corporation of Massachusetts
Filed Mar. 8, 1966, Ser. No. 532,672
6 Claims. (Cl. 18—30)

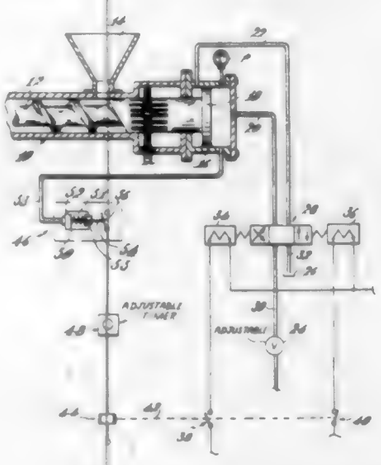


1. In an injection mold assembly for applying bottoms to footwear, a sole plate and mold ring which constitute the bottom and side wall of the mold cavity for receiving an elastomer to form a bottom having a tread surface and a peripheral edge, said mold ring embodying side wall parts separable to permit removing the finished article, two of said side wall parts containing at their interfaces grooves which collectively form an injection passage part way through the side wall; a conductor extending from the passage the remainder of the way through the side wall through which elastomer supplied to the passage enters the mold cavity, said conductor terminating at the interior surface of the side wall, said conductor being embodied in one of the parts exclusively of the other and being operable, by relative movement of the parts, when they are separated to free the article from the mold, to shear the sprue from the edge of the formed bottom at its place of junction therewith.

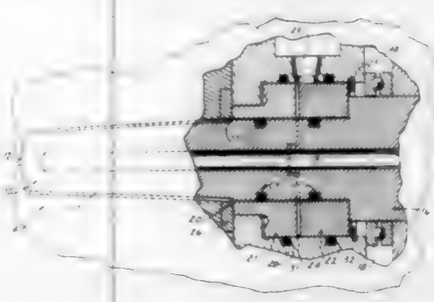
3,371,386
INJECTION APPARATUS WITH PRESSURE REGULATION
Herbert Ludwig, Desmastr. 112, Usen, near Bremen, Germany
Filed Mar. 31, 1966, Ser. No. 539,047
9 Claims. (Cl. 18—30)

1. In injection apparatus comprising a barrel within which there is mounted a screw which is both rotatable in the barrel and reciprocable therein to effect plasticization and ejection of an elastomer in and from the barrel, said screw at its rear end projecting into a motor cylinder and having on it a piston fitting said motor cylinder, and said motor cylinder being provided at its opposite end with conductors by means of which a pressure fluid is alternately supplied from a source of pressure fluid to one side or the other of the piston and vented from the opposite to a sump; means for limiting injection pressure to a predetermined maximum, comprising a slide valve operable, in one position, to connect the conductors, respectively, to said source of pressure fluid and to said sump to supply fluid pressure to one side of the piston and vent the other, and in another position to reverse the connections, pressure-responsive means connected to the motor cylinder at said rear side of the piston responsive to a pressure in excess of said predetermined maximum

to effect shifting of the slide valve to supply fluid pressure to the motor cylinder at the front side of the piston and to vent said rear side, and means for delaying the operation of said slide valve an appreciable interval following response of said pressure-responsive means to said predetermined maximum pressure.



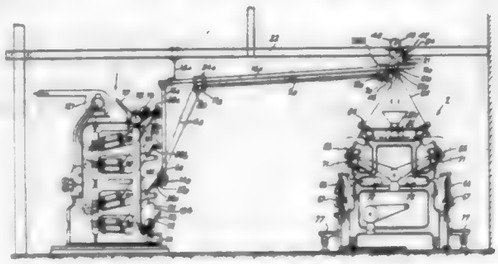
3,371,387
MOLD WITH MECHANICAL SEALS AT THE PARTING LINE
Kenneth J. Cleereman, Midland, and Edward R. Sederlund, Saginaw, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Oct. 22, 1965, Ser. No. 501,713
17 Claims. (Cl. 18—42)



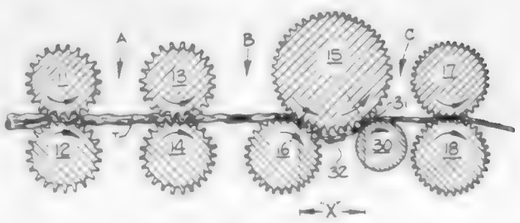
1. A mechanical seal for use in molding apparatus having an outer mold element and an inner mating mold element which together define a mold cavity and one of which is rotated or oscillated during the molding cycle, said mechanical seal comprising a first sealing ring fixedly secured to said outer mold element and exposed at the parting line of said molding apparatus; a seal member including a second sealing ring about said inner mold element with said second sealing ring engageable with said first sealing ring when said molding apparatus is closed; and means for forcing said second sealing ring into engagement with said first sealing ring when said molding apparatus is closed.

3,371,388
INSTALLATION FOR CONVEYING SLIVERS BETWEEN TWO TEXTILE MACHINES
Pierre Dillies, Croix, Nord, France, assignor to Etablissements Lemaire & Dillies, Nord, France, a French company
Filed Dec. 24, 1964, Ser. No. 420,965
Claims priority, application France, Jan. 3, 1964, 959,318
6 Claims. (Cl. 19—151)

An installation for continuously transferring slivers from a first textile machine adapted to produce slivers to a second textile machine adapted to process the slivers. The installation includes a plurality of narrow conveyor belts each extending between the two machines and laterally spaced apart from one another. The installation also includes means for guiding the slivers and distributing the slivers regularly over the width of the conveyor belts.

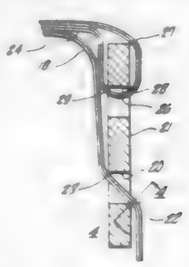


3,371,389
SLIP DRAFTING MEANS AND METHOD FOR TEXTILE FIBERS
Joe R. Whitehurst, Bessemer City, N.C., assignor to Ideal Industries Inc., Bessemer City, N.C., a corporation of North Carolina
Filed Oct. 21, 1965, Ser. No. 499,722
9 Claims. (Cl. 19—259)



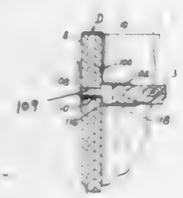
Apparatus and method for imparting draft to textile material while improving the uniformity thereof which includes feeding the textile material into and through a drafting zone and between rotating surfaces in the drafting zone rotating at substantially the same speed but at a slower speed than the rate of feed and defining a restricting passage in the drafting zone adjacent the entrance thereof to impart a sufficient retardant slip draft force on the textile material passing through the restricted passage to create and maintain a reservoir of excess fibers behind the passage in the drafting zone for distribution along the textile material to compensate for variations in weight and density of the textile material being drafted.

3,371,390
BALE TIE
Earle M. Sieglitz, Jr., Mexicali, Baja California, Mexico, assignor to Internacional, S.A., Panama, Panama, a corporation of Panama
Filed Dec. 13, 1965, Ser. No. 513,236
3 Claims. (Cl. 24—23)



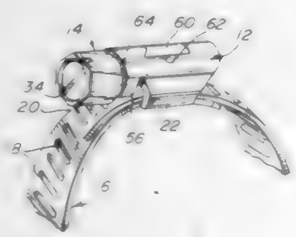
A bale tie having an elongated, flexible metal band provided with laterally-spaced ribs that project from the band to prevent stress concentrations in and failure of band when in use.

3,371,391
FASTENING DEVICE
Robert J. Holton, Rocky River, Ohio, assignor to Tinnerman Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application June 1, 1965, Ser. No. 460,370, which is a division of application Ser. No. 163,938, Jan. 2, 1962, now Patent No. 3,230,591, dated Jan. 25, 1966. Divided and this application Oct. 18, 1966, Ser. No. 587,605
21 Claims. (Cl. 24—81)



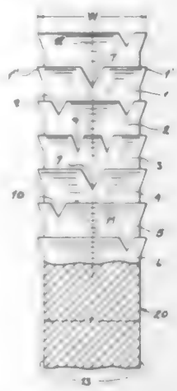
Fastening devices for retaining covers or the like on a container comprising a locking clip for securement over a marginal edge of the container and a supporting clip engageably interlocking with the locking clip for supporting a cover on the container. The locking clip in one form including a dart-like leg for insertion through the material of the container and the supporting clip including a channel for supporting a cover on the container. In addition, a device for retaining the ends of sheets of paperboard or the like having a U-shaped body with legs which have dart-like indents at the ends for gripping engagement with the paper sheets, and, a device having a generally flat body with pairs of slits defining a plurality of spring arms spaced from the body for gripping engagement with the paper sheets.

3,371,392
WORM DRIVE HOSE CLAMP
Walter Rueckheim, La Grange Park, Ill., assignor to Wittek Manufacturing Co., Chicago, Ill., a corporation of Illinois
Filed Feb. 21, 1966, Ser. No. 529,103
10 Claims. (Cl. 24—274)



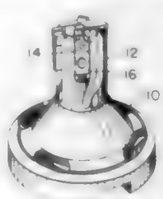
A worm drive hose clamp of the type having a slotted band, a worm screw housing and means to retain a worm screw in the housing, the clamp being formed of a single member of sheet metal having lugs at one end thereof which extend laterally therefrom, the lugs being bent arcuately so that they join at their free edges to form the housing, the free edges of the lugs having cooperating dove-tail interlocking formations so that once engaged together, the free edges cannot come apart although they are not welded or otherwise deformed. Two tabs integral with the housing are bent behind the head of the screw to lock the same in place. In one embodiment, the line of juncture of the free edges of the lugs is coincidental with a plane passing through the center of the housing. In another embodiment described, the line of juncture is offset from the center of the housing providing an imperforate wall of the housing at the crown or top thereof.

3,371,393
HOT-SAW BLADE
Günther Grassmann, Eddesse 40, uber Peine, Germany
Filed Mar. 4, 1966, Ser. No. 531,863
6 Claims. (Cl. 29—95)



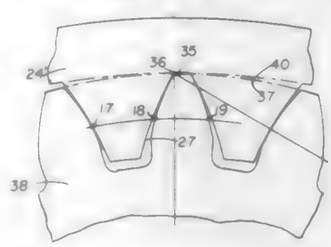
1. A hot-saw blade comprising a generally flat body having an edge provided with a succession of blade teeth, at least some of said teeth being notched in the plane of said body to deform them laterally outwardly, the notches of successive ones of said some of said teeth being laterally offset successively along said edge.

3,371,394
CARTRIDGE TYPE HOLDER
Hubert Dupuis, Warren, Mich., assignor to Goddard & Goddard Company, Detroit, Mich., a corporation of Michigan
Filed Sept. 27, 1965, Ser. No. 490,594
5 Claims. (Cl. 29—96)



A cartridge for cutting inserts adapted to be inserted in a tool holder pocket without lateral extension beyond the side walls of the pocket, and to have all adjusting and clamping devices thereof operable at the exposed outer surface thereof.

3,371,395
GEAR-SHAPED CUTTER
Ernest Wildhaber, Brighton, N.Y.
(124 Summit Drive, Rochester, N.Y. 14620)
Filed Feb. 18, 1966, Ser. No. 528,544
16 Claims. (Cl. 29—103)



1. A generating cutter adapted to engage a gear cut therewith in internal mesh, having a plurality of identical cutting teeth spaced in a circle about its axis, cutting edges being formed thereon by cutting faces, said cutter being designed so that the pitch point of said mesh

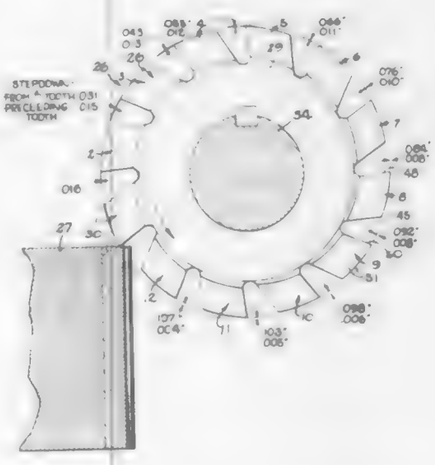
has a distance from the cutter axis exceeding that of the inmost boundary of the cutting edges by at least two thirds of their radial height at the mean stage of the cutter life, whereby at said distance the profile inclination of the cutter path matches the profile inclination of said gear.

3,371,396

CUTTER FOR MILLING GEARS AND THE LIKE

Stuart J. Johnson, Rockford, Ill., assignor to Barber-Colman Company, Rockford, Ill., a corporation of Illinois

Filed Apr. 7, 1966, Ser. No. 540,901
8 Claims. (Cl. 29—103)



1. A cutter adapted for use in a conventional hobbing cycle to continuously mill interdental spaces of predetermined and desired cross-sectional profile in the periphery of a cylindrical metal work blank, said cutter having, in combination, a generally cylindrical body adapted for rotation about its longitudinal axis, a multiplicity of teeth projecting from the periphery of the body and angularly spaced along a helical line extending around the body at least a full revolution, said line being inclined relative to said axis at a constant lead angle determined by the pitch of said interdental spaces, cutting edges around the projecting ends of the leading faces of said teeth having profiles corresponding to the desired final cross-sectional profiles of said spaces by virtue of the formation of all of said edge profiles by the same form tool moved only rectilinearly relative to the cutter, the projection of at least the last of said profiles on a plane paralleling said cutter axis being of a determined shape to produce said desired interdental space profile, and the radial spacing of the successively acting cutting edges along said helical line varying, according to a preselected pattern, with the arcuate lengths of the metal layers removed by the respective cutting edges along said spaces whereby the thicknesses of the layers removed by the successively acting teeth decrease progressively to compensate for the lengthening of the layers and cause the volumes of metal removed by the successively acting teeth to be substantially equalized.

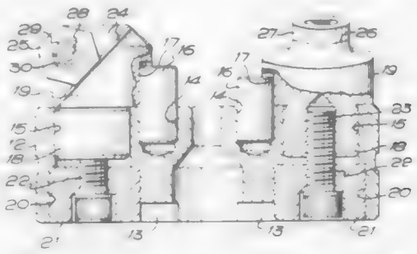
3,371,397

CUTTING TOOLS

Gerald H. E. Coleshill and David B. Scott, Sheffield, England, assignors to Marsh Brothers & Co. Limited

Filed July 13, 1967, Ser. No. 653,251
Claims priority, application Great Britain, July 20, 1966, 32,498/66; May 12, 1967, 22,108/67, 22,109/67
17 Claims. (Cl. 29—105)

A milling cutter has a plurality of seatings for throwaway tips, each seating having a spigot to fit in one of a plurality of bores in the cutter body and a surface non-concentric with the spigot, retaining screws for the seatings, and locking means for each seating locating in an adjacent bore and having a surface complementary to and



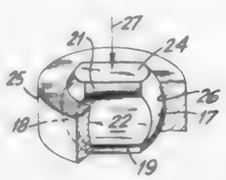
abutting the non-concentric surface on the seating, which locking means may be an adjacent seating, a locking plate or a spacing button also with a retaining screw, or a locking peg retained by engagement in a recess in the seating.

3,371,398

METHOD OF MAKING PLAIN SPHERICAL BEARINGS

Francis G. Patterson, Plainville, Ronald E. Restelli, Cromwell, and Warren A. Rival, Kensington, Conn., assignors to The Fafnir Bearing Company, New Britain, Conn.

Filed Aug. 3, 1965, Ser. No. 476,806
8 Claims. (Cl. 29—149.5)



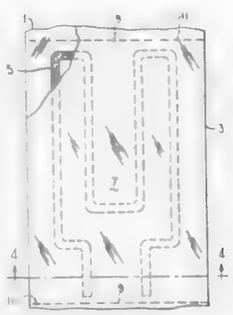
In the production of a plain spherical bearing, a truncated metal pusher ball is employed to prepare an outer ring for receiving a finished truncated bearing ball. The pusher ball is inserted endwise in the opening of the outer ring which has a spherical inner surface or raceway. The pusher ball is then rotated so that it nests in the raceway. The pusher ball is then pushed out of the outer ring, whereby to form a pair of deformed lips on the outer ring. The finished bearing ball is inserted into the outer ring via the lips thereof, and the lips thereafter closed.

3,371,399

METHOD OF MAKING INFLATED METAL PRODUCTS

Edwin A. Miller, Attleboro, Mass., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Filed Aug. 17, 1964, Ser. No. 389,934
13 Claims. (Cl. 29—157.3)

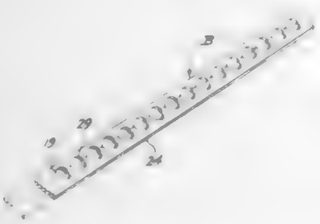


A composite sheet product having inflated separations in its area obtained by bonding the sheets with a stop-

off pattern therebetween, said pattern containing an oxide and if desired a protective material diffusible into the sheets. The sheets are heated in a reducing atmosphere penetrable through at least one of the sheets to reduce the oxide and release the resulting gaseous product in the area of the pattern to produce an inflation according to the pattern and to cause the protective material to diffuse into the sheet material, to provide a protective lining in the inflation if required.

3,371,400
SPLIT SHOT APPLICATOR AND MAGAZINE
George O. Edes, 60 Telfer Drive, Morgan Hill, Calif. 95037
Filed Feb. 15, 1966, Ser. No. 527,530
7 Claims. (Cl. 29—212)

1. A split shot applicator for fishing lines comprising:



a body adapted to receive an elongated shot magazine comprising a base strip having a plurality of split shot attached to one side thereof with the shot aligned lengthwise of the base strip and the split sides of the shot exposed,

an anvil mounted in one end of the body to lie clear of the base strip of a shot magazine loaded into the body and in alignment with the shot on such magazine,

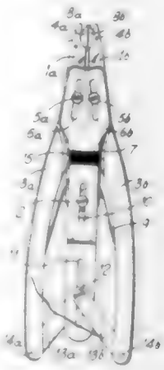
an actuating lever pivotally connected at one end thereof to the other end of the body,

a toggle link pivoted at one end thereof on the free end of the actuating handle and in light frictional engagement therewith for frictionally restricting pivotal movement of the toggle link relative to the handle,

means retaining the other end of the toggle link for longitudinal slidable movement within the body and free for movement transversely of the body from a position clear of the shot on a shot magazine loaded into the body to a position engaging the base strip of such magazine and into thrust engagement with the endmost shot of such magazine, said other end of the toggle link being moved endwise of the body toward the anvil by continued actuation of the handle toward the body for squeezing said last shot into gripping engagement with a fishing line inserted in the split of such shot.

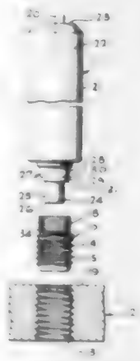
3,371,401
PLIERS FOR EXTERNAL CIRCLIPS
Michel Jean Louis Deguy, Luzy-sur-Marne, Haute-Marne, France, assignor to Deguy-Conge & Cie, Luzy-sur-Marne, Haute-Marne, France
Filed Feb. 10, 1966, Ser. No. 526,527
Claims priority, application France, Feb. 17, 1965, 5,860, Patent 1,433,504
9 Claims. (Cl. 29—229)

Circlips pliers provided with opening limiting jaws the spacing of which is adjustable in such a manner as to permit an instant and easy adjustment thereof with a single shifting of a slideway by the thumb of the hand which holds the pliers. The branches and the jaws are hingedly connected by two pins which engage respectively with two oblique symmetrical slots formed in the slideway.



Furthermore, this slideway serves as guide means insuring symmetrical spreading of the branches.

3,371,402
TOOL FOR EXPANDING THREADED INSERT
Robert Neuschotz, 1162 Angelo Drive, Beverly Hills, Calif. 90210
Filed Sept. 21, 1965, Ser. No. 488,934
12 Claims. (Cl. 29—243.52)



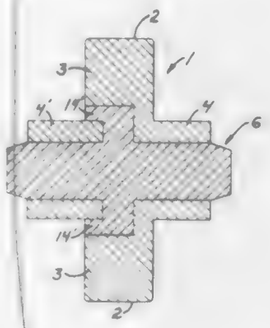
A tool for installing within a carrier part a threaded insert having a radially expansible locking portion. The tool has an expanding portion with a first external surface tapering at a first angle of between about 1 and 10 degrees, and a second external surface axially inwardly beyond the first surface and tapering at an angle of between about 20 and 45 degrees, with the two surfaces meeting each other at an annular edge at which the angle of taper changes abruptly. Two stop shoulders are provided on the tool axially outwardly of the expanding portion, and a reduced dimension pilot portion is provided axially inwardly of the expanding portion.

3,371,403
FLEXIBLE COUPLING MANUFACTURING
David Firth, 1441 E. Jefferson Blvd., South Bend, Ind. 46617
Filed Jan. 21, 1966, Ser. No. 522,200
7 Claims. (Cl. 29—416)

1. The method of manufacturing a pair of identical coupling members having face members with offset sectors which dovetail into each other and hubs adapted for mounting on shafts, comprising the steps of:

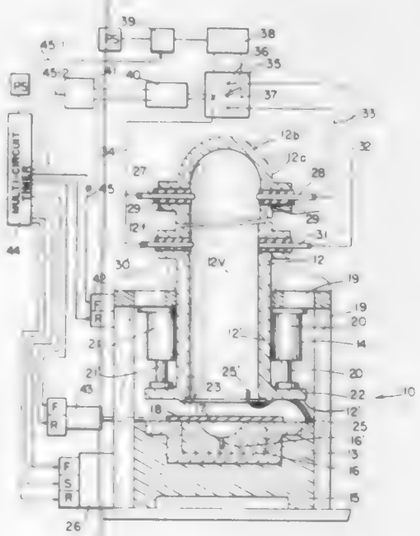
(a) forming said coupling members in an integral casting having a central core, the core providing a separation between the offset sectors of one member from the hub of the other and whereby said offset sectors overlap each other to form a continuous outer surface;

(b) machining one of said hubs;
(c) boring said hubs;
(d) machining the second hub;
(e) machining the outer periphery of said offset sectors in an uninterrupted manner; and



(f) severing the casting into two parts by removing the said overlapping portions of said offset sectors to thereby form two concentric, identical coupling members.

3,371,404
METHOD OF SIMULTANEOUSLY CLADDING AND DEFORMING MATERIAL BY INTENSE PRESSURE
Jerome H. Lemelson, 85 Rector St., Metuchen, N.J. 08840
Filed Oct. 22, 1965, Ser. No. 501,395
6 Claims. (Cl. 29—421)

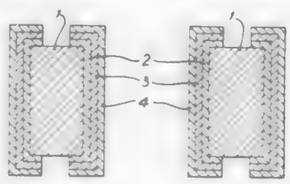


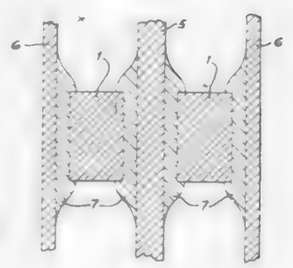
1. A method of cladding and shaping a member comprising:
(a) supporting a member to be clad adjacent a shaping means of predetermined shape,
(b) disposing a cladding material on the surface of said member to be clad and providing a working fluid medium above said cladding material,
(c) generating an intense pressure in said fluid medium against said cladding material at sufficient intensity to cause said cladding material to become molecularly bonded to the surface of said member and simultaneously causing said cladding material and member to be deformed to said predetermined shape.

3,371,405
METHOD OF PRODUCING POROUS HOLLOW NICKEL BODIES
Allen L. Klibanoff, Boston, Mass., assignor to the United States of America as represented by the United States Atomic Energy Commission
No Drawing. Filed Dec. 23, 1964, Ser. No. 420,843
1 Claim. (Cl. 29—423)

A method of producing hollow nickel bodies having a uniform wall thickness comprising non-electrolytically plating a layer of porous nickel on the surface of a polystyrene substrate and thereafter leaching the polystyrene substrate from the plated substrate.

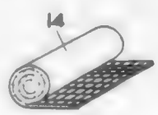
3,371,406
HERMETIC ELECTRICAL LEAD-IN ASSEMBLY
Robert L. Bronnes, Irvington, Richard C. Sweet, North Tarrytown, and Ray C. Hughes, Ossining, N.Y., assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Continuation-in-part of application Ser. No. 301,866, Aug. 13, 1963. This application Nov. 26, 1965, Ser. No. 510,017
4 Claims. (Cl. 29—473.1)





1. A method of hermetically sealing a meal to a ceramic comprising the steps of applying to the ceramic by cathodic sputtering successive layers of titanium, platinum, and stainless steel, and copper brazing the thus metallized surface of the ceramic to the metal part.

3,371,407
METHOD OF PRODUCING A COMPOSITE METALLIC MATERIAL BILLET
Peter Joseph Edward Forsyth, Farnham, Ronald Walter George, Farnborough, and Dennis Arthur Ryder, Macclesfield, England, assignors to Power Jets (Research and Development) Limited, London, England, a British company
Filed Feb. 15, 1965, Ser. No. 432,781
Claims priority, application Great Britain, Feb. 21, 1964, 7,362/64
6 Claims. (Cl. 29—475)



A method of producing in billet form a composite metallic material in which high strength reinforcing elements are embedded within a low strength matrix material and in a desired density or pattern. The reinforcing elements

are contained in a reinforcing layer which is placed on a layer of matrix material. The assembly is rolled-up and heated under pressure to convert it into billet form. The reinforcing layer is conveniently of a mesh or woven nature, the reinforcing elements being held and located by cross threads of a material which combines with the matrix material during the hot compacting treatment.

3,371,408

METHOD OF MANUFACTURING HOSE JOINT ELEMENTS

Francis Charles Charbonnet, % Cie des Raccords and Robinets, Ave. Florissant, Annemasse, Haute-Savole, France

Filed July 7, 1965, Ser. No. 470,009
Claims priority, application France, July 9, 1964, 981,244, Patent 1,408,901
3 Claims. (Cl. 29—508)

1. Method of manufacturing a hose joint of the bell-and-spigot type, comprising on the one hand an external bell and an internal tubular nipple, and of securing said bell on a hose end comprising a reinforcing mesh structure embedded in an external layer and an inner layer of flexible material, this method comprising the steps of:

imparting to said external bell the shape of a cylindrical skirt provided with a frustoconical inner flange;

forming in the inner wall of said skirt a plurality of retaining grooves;

machining a tubular nipple by forming an external peripheral groove therein;

inserting said nipple into the opening of said inner frustoconical flange of said bell;

crimping the inner edge of said flange into the external groove of said nipple;

stripping the hose end by removing said external layer of flexible material;

inserting said stripped end of said hose into the space formed between said skirt and said nipple;

crimping said skirt on said hose end and said nipple until said end is anchored in said retaining grooves in order to seal the joint between said bell and nipple and safely hold said hose within said bell.

3,371,409

METHOD OF MAKING A MANDREL FOR PRECISION-SHAPING INTERNAL SURFACES ON GLASS VESSELS

Robert E. Bonnet, Murray Hill, and James S. Hill, Cranford, N.J., assignors to Engelhard Industries, Inc., Newark, N.J., a corporation of Delaware

No Drawing. Filed Oct. 29, 1964, Ser. No. 407,544
4 Claims. (Cl. 29—528)

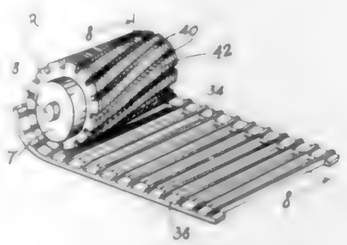
The present invention deals with a method of making a mandrel for shaping an internal surface on a glass vessel comprising coating a shaped base metal mandrel with a layer of fused oxide, snug-fitting a sleeve composed of a platinum-rhodium alloy onto the oxide-coated mandrel, shaping the sleeve to the contour of the coated mandrel, depositing a thin layer of platinum on the shaped sleeve, depositing a thin layer of gold on the platinum layer, heat treating the composite mandrel until the gold layer diffuses into the platinum layer leaving a gold-rich gold-platinum alloy surface on the mandrel.

3,371,410

FORMING AND DISPOSING INTEGRALLY CONNECTED CONDUCTORS IN ROTOR CORE SLOTS

Henry Gintovt, 14 Hamilton St., Dover, N.H. 03820

Continuation-in-part of application Ser. No. 328,786, Dec. 2, 1963. This application Jan. 12, 1965, Ser. No. 425,015
5 Claims. (Cl. 29—598)



Squirrel cage type secondary windings for induction motor rotors are formed from an improved sheet metal type secondary winding material to provide a secondary winding shell having conductor bar elements of a thickness greater than the depth of helical slots in a rotor body and whose end ring sections have outer edges spaced apart a greater distance than the axial length of the rotor. The secondary winding shell thus formed is subjected to forces for displacing the conductor bars into skewed positions and compressed into the bottoms of helical slots of the rotor. Portions of the conductor bars are flowed into overlapping relationship with respect to opposite end faces of outermost laminations in the rotor body to provide a solidly interlocked relationship of parts.

3,371,411

METHOD OF ALTERING THE TEMPERATURE SENSITIVITY OF STRAIN GAGES

John D. Russell, Malibu, Calif., assignor to Micro-dot, Inc., South Pasadena, Calif., a corporation of California

Original application June 15, 1960, Ser. No. 36,312. Divided and this application Sept. 17, 1965, Ser. No. 510,111
7 Claims. (Cl. 29—613)

1. Method for producing inherent temperature compensation within an unmounted strain gage composed of a strain responsive filament coupled through an electrical insulating material to a metallic support; that comprises establishing said strain gage at an elevated temperature, measuring the temperature sensitivity of said gage at said elevated temperature, and passing an electric current through the filament of said gage sufficient to effect a shift in temperature sensitivity therein with reference to its measured value.

3,371,412

METHOD OF TERMINATING A RESISTOR

James R. O'Keeffe, Columbus, Nebr., assignor to Dale Electronics, Inc., Columbus, Nebr., a corporation of Nebraska

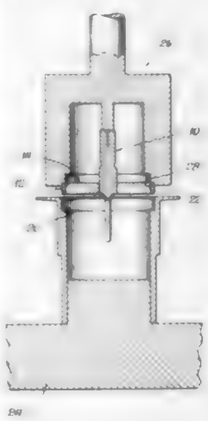
Filed Feb. 11, 1966, Ser. No. 526,898
8 Claims. (Cl. 29—621)

3. A method of terminating resistors comprising the steps of: providing a length of core material with resistance material thereon, providing a length of lead wire, providing a terminal band, securing said lead wire to said

resistance material by wrapping said terminal band around said core, said lead wire being between said band and said resistance material and having lengths thereof extending from both sides of said terminal band; severing said terminal band, said lead wire and said core in a direction substantially transverse to the longitudinal axis of said core.

6. A method of term . stor comprising the steps of: providing a lengt core material with resistance material thereon, providing a length of lead wire, securing said lead wire to said resistance material by wrapping a plurality of turns circumferentially around said core leaving a length of said lead wire at both ends of the wrapped section; severing said lead wire and said core through the wrapped portion of said lead wire.

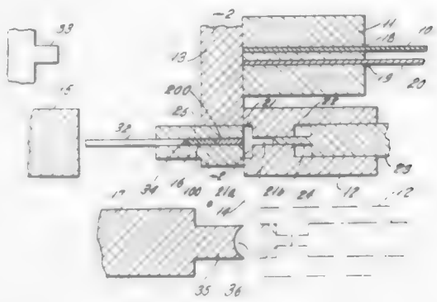
3,371,413
HERMETICALLY SEALED CONNECTOR
David F. Rundle, Cicero, Ill., assignor to Amphenol Corporation, Broadview, Ill., a corporation of Delaware
Filed Oct. 26, 1966, Ser. No. 589,551
1 Claim. (Cl. 29—629)



A hermetically sealed electrical connector and the method of making it wherein a glass body is interposed between a contact and a steel ring and is in melted-bond relationship with the contact and the ring to produce a hermetic seal therebetween. A metal shell, of a material such as aluminum, is disposed about the steel ring and is engaged to the ring in a heavy force fit accomplished with the shell heated to a predetermined temperature to result in a hermetic seal between the shell and the steel ring.

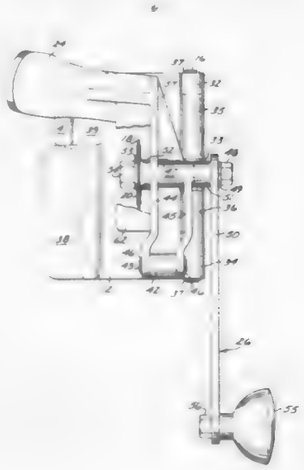
3,371,414
METHOD AND APPARATUS FOR FORMING COMPOSITE ELECTRICAL CONTACT ELEMENTS
Childress B. Gwyn, Jr., Export, Pa., assignor to Talon, Inc., Meadville, Pa., a corporation of Pennsylvania
Continuation-in-part of application Ser. No. 154,205, Nov. 22, 1961, which is a continuation-in-part of application Ser. No. 72,906, Dec. 1, 1960. This application Feb. 9, 1965, Ser. No. 431,310
5 Claims. (Cl. 29—630)

Method and apparatus for forming composite electrical contact elements by sequentially feeding and shearing stock materials for forming the contact working face and



body portions of such elements and bonding the resulting components by cold heading operations.

3,371,415
CONDUIT SAW
Elmer R. Hutchinson, North Hollywood, Calif., assignor of one-half to Elmer D. Dudek, Costa Mesa, Calif.
Filed May 15, 1967, Ser. No. 638,432
4 Claims. (Cl. 30—90.3)

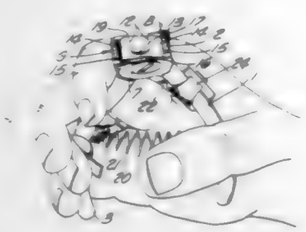


There is described in the specification a manually operated saw for making longitudinal cuts into cables and conduits and the like. The device is arranged so that a longitudinal section of the conduit is held in a vice one jaw of which has a finger paddle and the other a hand heel paddle whereby the jaws may be manually clamped. A saw blade carried by a hinged saw blade holder is lowered in selected degree through a cutout or slot in one jaw of the device into the space where the conduit is clamped. A handle is arranged to turn the saw blade.

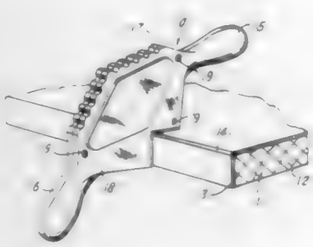
3,371,416
LEMON CLIPPER
Walter R. Horton, deceased, late of Ontario, Calif., by Marjorie Helen Horton, administratrix, Ontario, Calif., assignor to Sunkist Growers, Inc., Los Angeles, Calif., a corporation of California
Filed Jan. 21, 1966, Ser. No. 522,331
5 Claims. (Cl. 30—233)

The lemon clipper comprises a pair of pivotally connected complementary parts one of which has a gauge portion with a slot forming two gauge fingers with one of the fingers in the form of a first blade, the other complementary part having a second blade to cooperate with the first blade.

The slot of the gauge portion of the first complementary part forms a gauge edge of generally U-shaped configuration and the gauge portion is further cut away to form a gauge shoulder of generally U-shaped configuration symmetrically located relative to the U-shaped gauge edge, the gauge shoulder engaging lemons of globular shape to position the two blades for correctly severing the stems of the lemons.



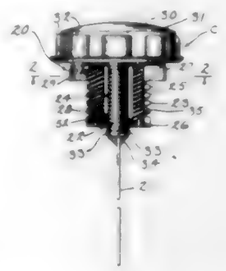
3,371,417
EDGE BEVELING TOOL
Martin Leibow, 7007 Mason Dells, Dallas, Tex. 75230
Filed Oct. 31, 1966, Ser. No. 590,926
9 Claims. (Cl. 30—293)



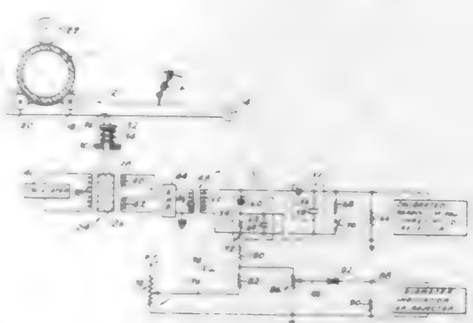
1. A tool comprising a frame having handle means for manual engagement, one side of said frame defining a notch with the faces of the notch providing bearing surfaces for engaging a workpiece, a cutting blade positioned adjacent the corner of said notch, an adjustable plate secured to said frame, an arm member pivotally mounted on said plate with said cutting blade being on one side of said arm member, and adjustable detent means fixed to said plate and bearing upon said arm member from a direction opposite said notch.

3,371,418
OIL LEVEL TESTING DIP STICK WITH CLOSURE
Axel Moeller, St. Petersburg Beach, Fla., assignor to Moeller Mfg. Co., Inc., Greenville, Miss., a corporation of Wisconsin
Filed May 18, 1966, Ser. No. 551,099
9 Claims. (Cl. 33—126.7)

1. An oil level testing dip stick having a closure body for sealing the oil filter pipe of an internal combustion engine including, a resilient compressible stopper body having an axial bore therethrough, inner and outer compression plates engaging the opposite ends of said stopper body, the outer compression plate having an axial opening, said inner compression plate having an inwardly struck axially disposed internally threaded sleeve forming a nut, means for anchoring said inner compression plate to said compressible stopper body, a rod rotatably mounted in the opening of the outer compression plate and threaded into the inner compression plate, said rod being continued beyond the inner compression plate and being provided with means to prevent the inner compression plate from moving off the inner end termination of said rod, a dip stick body carried by said closure body, and operating means on the outer end of the rod for turning the same in the inner compression plate.



3,371,419
OUT-OF-ROUNDNESS AND DIAMETER GAGE
Howard E. Banks, Horseheads, and Curtis A. Hartman, Elmira, N.Y., and Robert S. Hallstein, Enon, Ohio, assignors, by mesne assignments, to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware
Filed Oct. 15, 1962, Ser. No. 230,651
17 Claims. (Cl. 33—174)

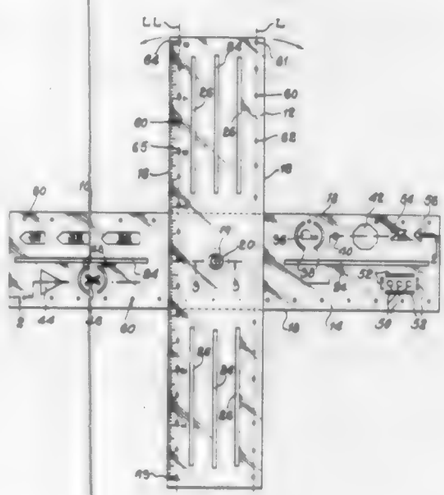


1. Apparatus for inspecting the peripheral configuration of circular objects for out-of-round condition comprising means for translating the peripheral configuration of a said object into an electrical signal which has a characteristic that varies according to said out-of-round condition and attains a maximum excursion while said inspecting is taking place, and means for obtaining a continuous fluctuating indication representing the difference between the maximum excursion derived during said inspection process and the instant values of the said signal characteristic regardless of the diameter of the said object being inspected.

3,371,420
STENCILS FOR DRAWING TRAFFIC ACCIDENT DIAGRAMS
Vincent J. Di Pane, Jr., 89 S. Pennington Road, New Brunswick, N.J. 08901
Filed Oct. 19, 1965, Ser. No. 497,689
6 Claims. (Cl. 33—174)

A stencil for facilitating the drawing of traffic accident diagrams and including a pair of plate members attached to one another for relative pivotal movemeent, each plate member having parallel drawing edges for defining a width corresponding to the width of a roadway in a diagram to be drawn, at least one slot in each plate member medially between the drawing edges for providing road-

way centerline drawing edges, and a plurality of perforations in at least one plate member aligned along a straight line and extending a distance along that straight line which is greater than the lateral distance between the roadway defining drawing edges and spaced from one



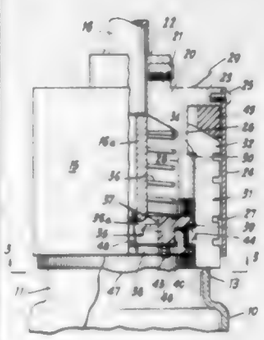
another at intervals equal to that lateral distance divided by a whole number for enabling the construction of diagrams including curved roadways. At least one plate member is also provided with apertures having outline configurations establishing further drawing edges defining a variety of traffic diagram symbols.

3,371,421

CONTAINER RIM DIP INSPECTION APPARATUS

Roger H. Fink and Frederick Z. Fouse, Lancaster, Ohio, assignors to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware

Filed Aug 16, 1966, Ser. No. 572,717
16 Claims. (Cl. 33—174)



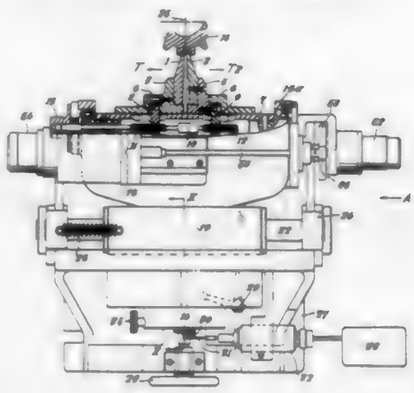
1. A container rim inspection apparatus comprising a plurality of sensing elements, a support member for holding said sensing elements to extend radially in a circumferential array and an axially movable relation to one another on engagement with a container rim, a reference member having axially spaced first and second means for defining the limits of deviation of said sensing elements, means for urging said reference member to a position wherein said first means is in reference relation with those of said sensing elements contacting a container rim and wherein said second means can be contacted by other of said sensing elements for an unacceptable deviation in position of any of said other of said sensing elements to determine the acceptability of an inspected rim.

3,371,422

GEAR-CHECKING INSTRUMENTS

Karl Müller, Zurich, Switzerland, assignor to Maag Gear Wheel & Machine Company, Limited, Zurich, Switzerland, a Swiss company

Filed Mar. 31, 1966, Ser. No. 539,053
Claims priority, application Germany, Apr. 6, 1965, M 64,794
7 Claims. (Cl. 33—179.5)



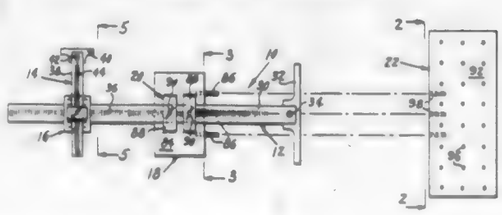
1. A machine for checking gears for radial run-out, comprising a machine frame, a rotatable shaft, measuring means mounted on the shaft for rotation therewith, the said measuring means having the form of an interrupted body of revolution and representing a gear tooth adapted to enter a tooth space of a gear wheel which is to be tested, a holder in which the said shaft is mounted with the axis of the shaft perpendicular to the axis of the holder, the holder being mounted on the machine frame for reciprocation perpendicular to the axis of the holder and for resilient movement perpendicular to the axis of said shaft, and means for indicating and recording the said movement of the measuring means perpendicular to said shaft.

3,371,423

MEASURING DEVICE FOR MARKING FASTENERS

Bryant M. Paul, North Highlands, Calif. (6830 Silverthorne Circle, Sacramento, Calif. 95842)

Filed June 1, 1966, Ser. No. 554,405
8 Claims. (Cl. 33—189)



1. A measuring device comprising:

a straight elongate bar having a longitudinal axis and an end perpendicular to the axis;

an alignment bar, extending away from the elongate bar, having a flat surface parallel to the axis;

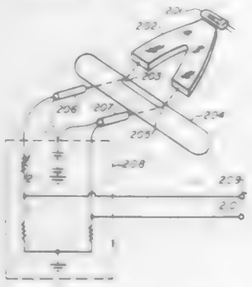
means mounting the alignment bar on the elongate bar positioning the flat surface parallel to the axis;

a measuring plate having a pair of parallel first and second planar faces and at least one aperture perpendicular to the faces for receiving a marking element; and

means mounting the measuring plate on the elongate bar between the alignment bar and the perpendicular end for movement parallel to the axis, the first face of the measuring plate residing flush against the elongate bar, the second face being spaced from the bar at least as far as any other element of the device so that when the second face abuts a planar surface

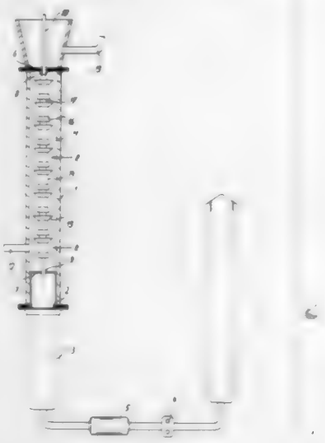
the second face positions the elongate bar parallel to the planar surface.

3,371,424
REFERENCE ATTITUDE INDICATING DEVICE
William Harold Sweet, Ottawa, Ontario, Canada, assignor to Northern Electric Company Limited, Montreal, Quebec, Canada
Filed Mar. 25, 1965, Ser. No. 442,742
5 Claims. (Cl. 33—206)



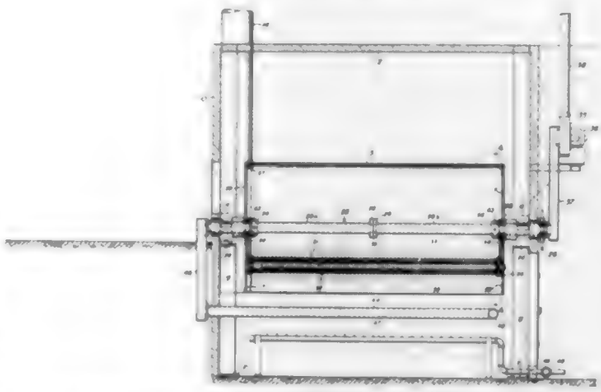
An apparatus which translates relative bubble position in a spirit level into a corresponding electrical signal. A reference light source directs light to a bubble meniscus surface from which a portion of the light, depending on the relative bubble position, is reflected onto a light sensitive detector that produces an output signal proportional to the quantity of light reflected.

3,371,425
APPARATUS FOR REDUCING THE SOJOURN TIMES IN FLUIDIZED BEDS
Fritz Glaser, Offenbach am Main, and Joachim Wentz, Hofheim, Taunus, Germany, assignors, by mesne assignments, to Vickers-Zimmer Aktiengesellschaft, Planung und Bau von Industrieanlagen, Frankfurt am Main, Germany, a corporation of Germany
Filed June 21, 1965, Ser. No. 465,683
Claims priority, application Germany, June 23, 1964, Z 10,927
11 Claims. (Cl. 34—57)



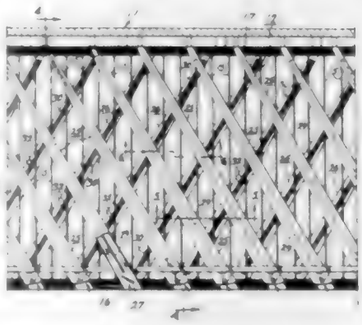
An improved method and apparatus for drying particulate solids which produces a highly uniform moisture content in the particles. A drying gas is introduced through precisely arranged orifices in the base plate of an enclosed, elongated, vertical drying chamber. The chamber contains a plurality of independent, rotatable, vertically spaced hollow rotor elements. The hollow rotor elements define a vertical column in the center of the chamber. Particulate matter is continuously introduced into the chamber adjacent the base plate and is forced upwardly in the chamber through the column defined by the hollow rotor elements. Some particles which are carried escape from the column to the sides of the chamber, cascade downward in the chamber and are re-cycled upward again. Each of the rotor elements acts as an independent fluidizing bed through which particles are re-cycled.

3,371,426
DEHYDRATING DRUM
Perry S. Martin, Harrisonburg, Va., assignor to Egg-Vi-Tein Company, Harrisonburg, Va., a partnership
Filed July 19, 1965, Ser. No. 473,135
4 Claims. (Cl. 34—134)



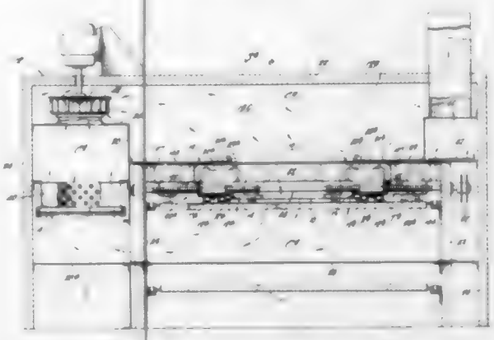
This invention relates to an improvement in devices for drying viscous masses using a heated revolving drum with means for dividing the mass into smaller portions whereby the heat is applied effectively. The device provides for an axial duct for introducing a stream of preheated air and withdrawing air with accumulated moisture. The device includes numerous additional details, among which is the use of parallel arms extending radially from the axis of the drum and a plurality of disks rolling against the interior of the drum, and means for self-cleaning the disks and for the mounting of the disks so as to render them highly efficient.

3,371,427
APPARATUS FOR PROCESSING WEB MATERIAL
John R. Thygeson, Sr., Fox Chase Manor, Pa., assignor to Proctor & Schwartz, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Filed Sept. 14, 1965, Ser. No. 487,150
10 Claims. (Cl. 34—155)



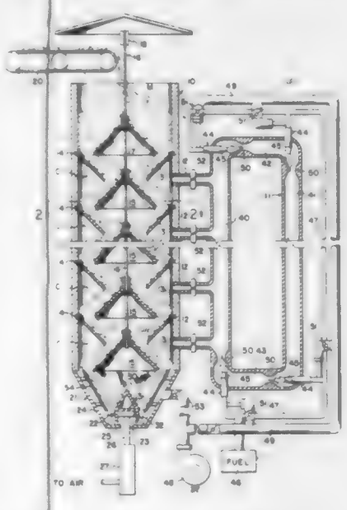
Apparatus for subjecting fabrics and similar webs to a gaseous-treating medium which affords freedom for shrinkage of the web during the treatment. The apparatus projects ribbons of gaseous medium against and substantially normal to the web both above and below the web at an acute angle to the direction of travel of the web so as to criss-cross above and below the web; in one form, the apparatus projects a series of ribbons angled to the right above the web and a corresponding series of ribbons angled to the left below the web; and in another form, the apparatus provides criss-cross intersecting ribbons both above and below the web.

3,371,428
FABRIC DRIER
John R. Thygeson, Sr., Fox Chase Manor, and Charles W. Allen, Lafayette Hill, Pa., assignors to Proctor & Schwartz, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Filed Aug. 23, 1965, Ser. No. 481,563
10 Claims. (Cl. 34—158)



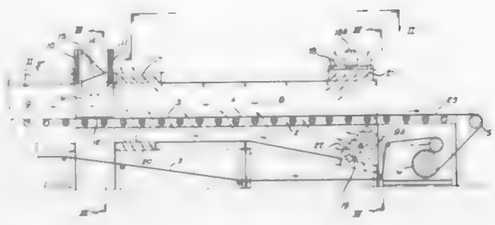
A material treating apparatus suited for drying carpeting dyed by a wet process, the apparatus consisting of a housing, conveyor means for continuously moving the carpeting along a predetermined path through the housing and conditioning means for heating and circulating a treating medium through the carpeting as it passes through the housing. The interior of the housing is divided into several chambers or compartments including a plenum chamber communicating with a conditioning chamber where the treating medium is heated, and an air return manifold below the plenum chamber. The plenum chamber has a transfer section defined by a pair of spaced apart, longitudinally extending wall portions and a pair of adjustable side walls. The side walls are adjustable so that the volume of the transfer section of the plenum chamber may be selectively varied to accommodate carpeting of various widths, the upper and lower edges of the adjustable side walls being provided with seals so that substantially all of the treating medium circulated in the housing is directed through the transfer section of the plenum chamber and the material supported on the conveyor.

3,371,429
MATERIAL PROCESSING TOWER
Boyd C. Miller and Samuel A. Cooper, Salisbury, N.C., assignors to Miller Equipment Company, Salisbury, N.C., a corporation of North Carolina
Filed May 9, 1966, Ser. No. 548,779
8 Claims. (Cl. 34—171)



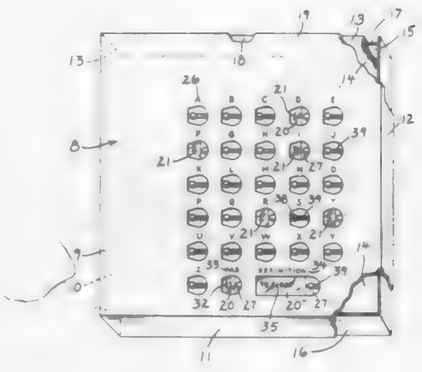
This invention relates to a material processing tower for the treatment of granular or particulate material wherein the material passes through a series of cones and funnels in a sinuous path.

3,371,430
RAPID COOLING SYSTEM FOR GLASS ANNEALING LEHRS
Edward W. Bowman, Fayette, Pa.
(279 Derrick Ave., Uniontown, Pa. 15401)
Filed Aug. 25, 1966, Ser. No. 575,017
2 Claims. (Cl. 34—217)



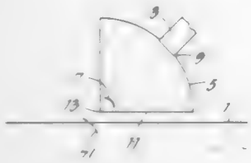
This disclosure relates to new and useful improvements in decorating and annealing lehrs for glassware and the like to provide for the rapid cooling of the ware at the discharge end of the annealing tunnel by causing the cooling medium to drift toward the charging end of the lehr in a controlled manner to obtain uniform distribution of temperature to avoid rejects or re-annealing if the temperature gradient were disturbed by load variations and the like. The improved lehr is materially shortened.

3,371,431
VOCABULARY AND SPELLING GAME DEVICE
Joseph E. White, 1330 Boilvin Ave.,
Rockford, Ill. 61103
Filed Feb. 25, 1965, Ser. No. 435,122
10 Claims. (Cl. 35—9)



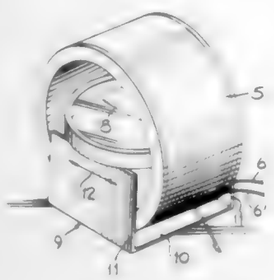
A word game having a front panel with a series of windows having slidable closures, each window having a letter of the alphabet associated therewith; a sheet receivable behind the panel and having an array of numbers thereon so arranged as to be visible through certain of the windows; the letters associated with these certain windows, when arranged in the order indicated by the visible numbers, form a word which agrees with a word definition given the user as his initial starting step. The sheet behind the panel is square and has four different arrays of numbers on each side at 90° intervals with respect to one another, so that the one sheet can be used in eight different positions, four for each side, for eight different words.

3,371,432
VISUAL SIMULATION
Noel Edward Lamb, 4 Falcon Close, Shoreham-by-Sea, Sussex, England
Filed Oct. 11, 1966, Ser. No. 585,951
Claims priority, application Great Britain, Oct. 11, 1965, 43,105/65
10 Claims. (Cl. 35—12)



1. Visual simulation equipment comprising light transmission means having a receiving end and a projection end; input means located adjacent said receiving end to receive light from a model to guide light from the model to said receiving end, said input means comprising a concave mirror to be directed at the model and a convex mirror arranged to receive light from said concave mirror and reflect this light to said receiving end; and display means optically similar to said input means and disposed to utilize light from said projection end to produce a picture of the model, said display means including a concave screen and a convex mirror located to reflect light projected from said projection end onto said concave screen on which the picture is produced.

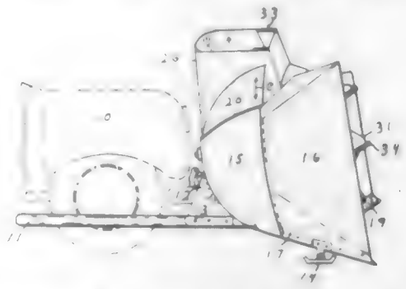
3,371,433
EDUCATIONAL GALVANOSCOPE STAND
Hyman Ruchlis and Harry Spector, Brooklyn, N.Y., assignors to Harcourt, Brace & World, Inc., New York, N.Y., a corporation of New York
Filed Nov. 9, 1965, Ser. No. 506,954
5 Claims. (Cl. 35—19)



The galvanoscope stand has a base which supports a coil of wire and a pair of upstanding legs which support a compass at the center of the coil of wire and which converge towards each other so as to resiliently abut against the coil of wire to retain the coil on the base.

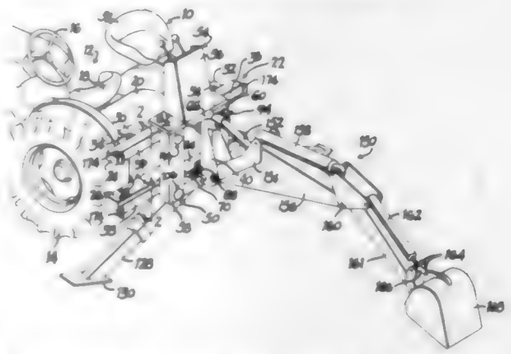
3,371,434
COMBINED ROTARY AND PUSH TYPE SNOW PLOW
Evert Wandscheer, 451 3rd Ave. NE., Sioux Center, Iowa 51250
Filed Feb. 5, 1965, Ser. No. 430,723
12 Claims. (Cl. 37—43)

A snow plow having an impeller mounted for rotation in a plane parallel to the line of travel. The impeller is mounted in an inner shell which, in turn, is pivotally mounted in an outer shell. The inner shell can, therefore, be rotated relative to the outer shell, and means is also



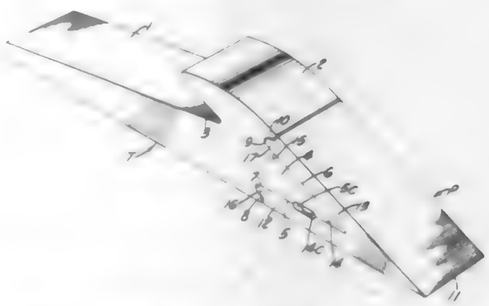
provided to pitch the inner shell relative to the outer shell.

3,371,435
SIDE-SHIFTABLE EXCAVATOR
Raymond J. Miller, Racine, Wis., assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Filed Apr. 22, 1965, Ser. No. 449,966
6 Claims. (Cl. 37—103)



A side-shiftable excavator having a stationary frame and a mobile frame. The stationary frame has a pair of slide rails supported in spaced relation which slidably receive the mobile frame. The mobile frame has means engaging the top and sides of the upper rail and only the sides of the lower rail to facilitate easy relative displacement of the two frames. Limit means are provided and will engage the bottom of the top rail upon significant upward movement of the mobile frame with respect to the fixed frame.

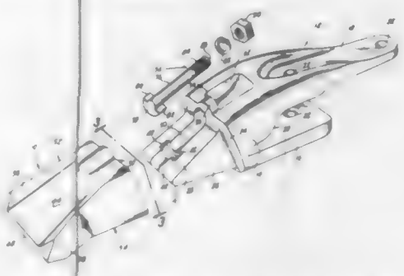
3,371,436
DIGGER TOOTH WITH REPLACEABLE POINT
Raymond W. Swanson, 14515 Cornishcrest Road, Whittier, Calif. 90604
Filed Dec. 21, 1964, Ser. No. 419,901
9 Claims. (Cl. 37—142)



A digger tooth assembly having a tooth body, a point mounted on the body for separation from the body by selective relative movement of the point with respect to the body along longitudinal and lateral direction lines of the body, and one or more removable keys disposed within keyways recessed into co-engaging faces on the

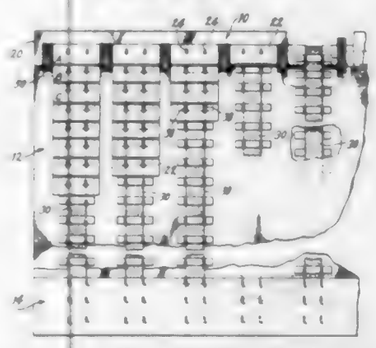
body and point and extending in acute angular relation to both the longitudinal and lateral direction lines of separation movement of the point from the body in such a way that the point is releasably keyed against both longitudinal and lateral separation from the body.

3,371,437
LOCKING DEVICE FOR DIGGER TOOTH
William W. Wilson and Robert D. La Fitte, Shreveport, La., assignors to Mid-Continent Steel Casting Corporation, Shreveport, La., a corporation of Louisiana
Filed Apr. 28, 1965, Ser. No. 451,406
4 Claims. (Cl. 37—142)



A locking device in the form of a bolt with a half round head for securing a removable digger tooth point to a supporting shank. The bolt is disposed in the shank interiorly of the assembled tooth point and shank with the head rotatable from nesting engagement in a socket in the shank to nesting engagement in a registering socket in the tooth point and the point and shank are secured together by the bolt after moving the sockets out of register.

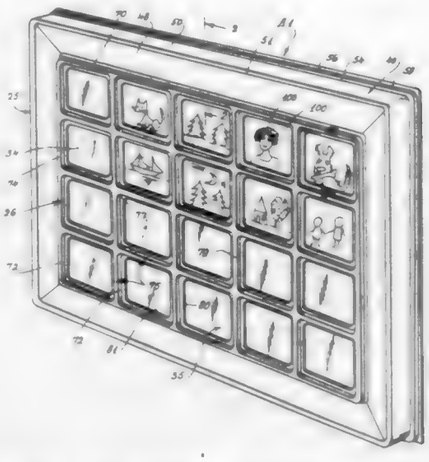
3,371,438
WORK SCHEDULING APPARATUS
Albert N. Larrington, 10 Knollwood Road, Squantum, Mass. 02171
Filed Aug. 23, 1965, Ser. No. 481,477
1 Claim. (Cl. 40—124)



Apparatus for scheduling work to be performed at a plurality of work stations comprising a production panel for identifying in process work and an inventory panel for recording the backlog of work comprising a plurality of discrete, endless belts each movably mounted for independent movement in alined relationship and means for mounting a plurality of work order cards on each of said belts.

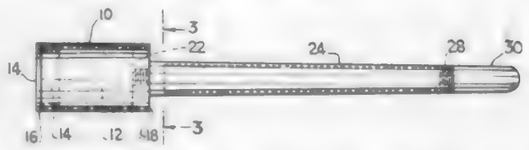
3,371,439
QUICK MOUNTING FRAME ASSEMBLY FOR PHOTOGRAPHS AND THE LIKE
Douglas J. Smith, 57 Heritage Court, Hillsdale, N.J. 07642, and Richard S. Saulsbury, Forest Hills, N.Y., (2137 Gerritsen Ave., Brooklyn, N.Y. 11229)
Filed Oct. 26, 1966, Ser. No. 589,731
17 Claims. (Cl. 40—156)

A display holder including a matrix defining a plurality of tray-like depressions each of which may receive a display element. A retainer comprising a grid defining a plurality of open frames corresponding in number to the depressions on the matrix is shaped to snap fit thereover



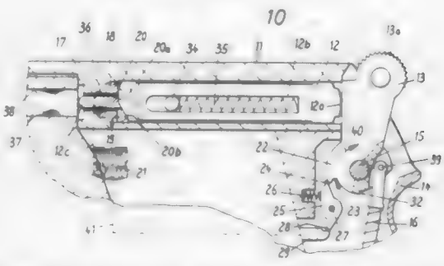
and so retain the displays in position the matrix is further provided with a flange about its perimeter by which it may be mounted in a frame.

3,371,440
ADJUSTABLE MAGAZINE PLUG
Charles Cassell, 2708 SW. 44th, Oklahoma City, Okla. 73119
Filed Mar. 24, 1967, Ser. No. 625,848
5 Claims. (Cl. 42—49)



A plug adapted to be removably inserted into the magazine of a shotgun to absorb moisture which would otherwise impair the functioning of the shotgun, and in addition when necessary, to reduce the capacity of the magazine to two shells as required by law in certain states when hunting migratory birds.

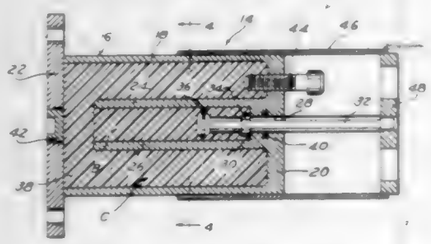
3,371,441
SAFETY MECHANISM FOR HAND FIREARMS
Fritz Walther, 4 Wettersteinweg, 79 Ulm (Danube), Germany
Filed Feb. 18, 1966, Ser. No. 528,636
Claims priority, application Germany, Feb. 25, 1965, W 38,632
6 Claims. (Cl. 42—70)



This invention broadly relates to a safety mechanism to firearms which has a safety-off and a safety-on position. The safety mechanism is comprised of a manually operated safety lever and rotatable member having at least first and second cam surfaces which confront the firearm firing pin and which lies between the forward end of the firing pin and the primer of a cartridge loaded into the firearm. Rotation of the safety lever to the safety-on position blocks the firing pin from striking the primer of the

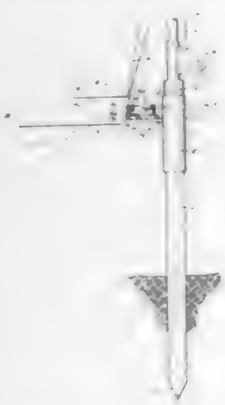
cartridge. Movement of the safety lever to the safety-off position provides sufficient clearance for the forward end of the firing pin to strike the primer of the cartridge. In moving the safety lever from the safety-on to the safety-off position, an edge of the rotatable member which joins the cam surfaces drives the firing pin rearwardly which in turn engages and rotates the firing hammer through a small angle. A safety catch provided on the firing hammer releases a spring biased trigger lever member causing it to embraced by the safety catch, locking the firing hammer into a slightly cocked position. With the trigger lever projection locked into the safety catch, any effort to fire the weapon by squeezing the trigger will be thwarted. The firing hammer must be moved to the fully cocked position before the weapon can be fired.

3,371,442
DAMPED SPRING MEANS
Robert L. Carlson, Chicago, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware
Filed Mar. 24, 1966, Ser. No. 537,206
3 Claims. (Cl. 42—74)



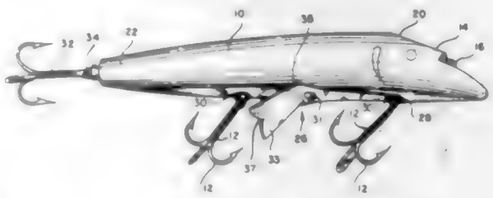
A normally extended damped spring operably connected between the relatively movable stock and buttstock boot of a shotgun or the like to absorb and dissipate the shock of recoil with the damped spring having a closed chamber filled with a compressible solid fixed to one of the relatively movable members and a piston rod fixed to the other and having a piston provided with orifice means disposed in the closed chamber, the compressible solid providing a damping and spring force on the piston as the rod moves into the chamber and reduces the volume of the compressible solid while forcing same through the orifice means with the expansion of the compressible solid after each recoil serving as the sole force for returning the damped spring to its normally extended condition.

3,371,443
FISHERMAN'S SIGNALING DEVICE
Don R. Dobson, Holden, Utah 84636
Filed Oct. 23, 1965, Ser. No. 503,160
4 Claims. (Cl. 43—17)



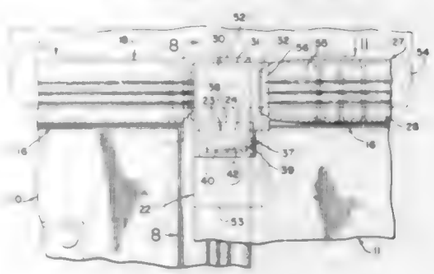
1. A fisherman's signaling device comprising:
a stake;
means adapted to receive the handle of a fishing pole carried by the stake;
a flag arm pivotally carried by the stake;
a latch arm pivotally carried by the stake, said latch arm including a bend adapted to have a fishing line passed thereunder and being adapted to hold the flag arm in a set position when the latch arm is in a lowered position and to release the flag arm to drop when it is moved to a raised position; and
means for changing the effective moment arm of the latch arm thereby changing the amount of pull required to separate the latch arm from the flag arm.

3,371,444
FISHING LURE
Oran D. Cox, 706 E. Dennison St., Appleton, Wis. 54911
Filed May 5, 1965, Ser. No. 453,338
1 Claim. (Cl. 43—42.22)



A fishing lure comprising an elongate body member having at its front end a plane surface sloping upwardly and rearwardly to produce a descending effect on the lure as it is moved through the water, and a flat triangular plate secured to the bottom of the lure with an unattached diverging base portion bent downwardly and rearwardly at an angle to produce an ascending effect on the lure to counteract the effect of the said plane surface and being capable of adjustment to various angular positions to control the depth of the lure in the water.

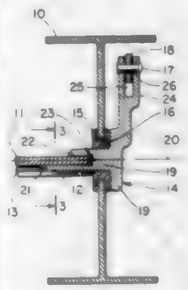
3,371,445
DOUBLE SLIDING FLUSH PLUG DOOR GASKET
Theodore Z. Herr, Highland Park, Ill., and William Hoverman, Jr., St. Marys, Ohio; said Herr assignor to The Youngstown Steel Door Company, and said Hoverman assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, both corporations of Ohio
Filed Sept. 15, 1965, Ser. No. 487,405
7 Claims. (Cl. 49—368)



Angle flap seals or gasket extensions capable of attachment to the top and bottom of the auxiliary door compression gasket of a railroad car. The compression gasket extensions are attached to the interior flange of the auxiliary door which is overlapped by the main door (when both doors are in closed position) by means of integral flap portions. The flap portions carry projection pads which are releasably received in mating apertures in the interior flange. The auxiliary door compression gasket extensions extend only a portion of the length of the interior flange of the auxiliary door and terminate in a feathered edge. The feathered edge provides a tight seal

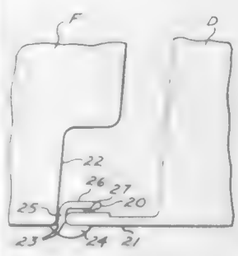
at the junction of the auxiliary door compression gasket extensions, the interior flange of the auxiliary door and the compression gasket of the main door.

3,371,446
MOUNTING MEANS FOR LOUVER BLADES
George W. Minds, Jr., 2408 Forney St., Los Angeles, Calif. 90031
Filed Aug. 2, 1965, Ser. No. 476,501
5 Claims. (Cl. 49—403)



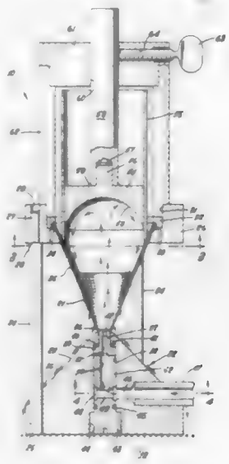
This disclosure relates to a louver assembly having a pivot means for pivotally connecting a louver blade to a frame member for pivotal movement relative thereto. The pivot means includes a one-piece, generally L-shaped pivot member having an intermediate shank portion rotatably supported by the frame member and first and second end portions extending at right angles to each other. The first end portion is connected to an actuating member and has an open ended slot therein for receiving the actuating member. The second end portion includes a pair of spaced boss portions which are tapered and which define an open ended tapered slot therebetween for receiving an end of the louver blade in wedging relationship. This securement is stabilized by ribs on the louver blade end defining a channel for receiving one of the boss portions.

3,371,447
TRIM STRIP STRUCTURES AND METHODS FOR THEIR MANUFACTURE
Charles E. Ruff, Lakewood, Stanley Gomez, Cleveland, and Norman C. Jackson, Sheffield Lake Village, Ohio, assignors to The Standard Products Company, Cleveland, Ohio, a corporation of Ohio
Filed Feb. 3, 1965, Ser. No. 429,986
10 Claims. (Cl. 49—490)



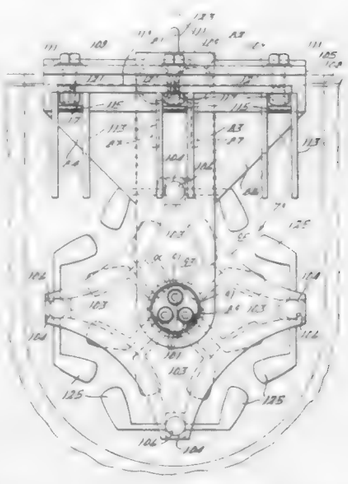
1. A trim strip structure for securing to the edge flange of an automobile door for bridging the opening between the door edge and an adjacent member, said structure comprising a channel-shaped, flexible core of sheet material having leg portions for gripping either side of the flange; said leg portions being joined at their outer ends by a central web; a flexible cover encasing said core; said cover including a bumper portion disposed substantially coplanar with one of said leg portions for mounting to the outside surface of the door flange; said bumper portion having a lip portion extending outwardly beyond said web for projecting over said opening when the door is closed.

3,371,448
APPARATUS FOR SHAPING CRYSTALLINE CARBON BODIES
Frank L. Christensen, Salt Lake City, Utah, assignor to Christensen Diamond Products Company, Salt Lake City, Utah, a corporation of Utah
Filed Mar. 19, 1965, Ser. No. 441,238
8 Claims. (Cl. 51—163)



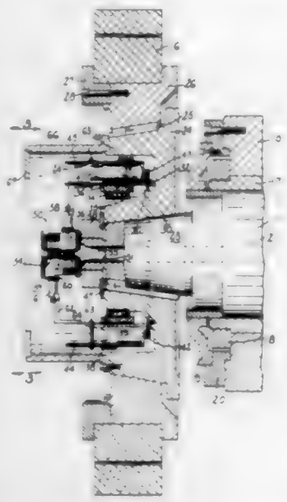
Apparatus for reshaping diamonds, in which fluid is jetted from a nozzle to carry diamonds upwardly and impact them against the generally spherical internal surface of an anvil, the diamonds dropping upon a downwardly tapering screen toward the nozzle for repeated upward impacting against the anvil, as well as against other diamonds within the screen, grits and powders resulting from the impacting action and fluid passing through the screen onto a downwardly diverging diverter.

3,371,449
VIBRATORY FINISHING APPARATUS AND METHOD
Eugene E. Olson and Harold A. Mickelson, Albert Lea, Minn., assignors to King-Seeley Thermos Company, Ann Arbor, Mich., a corporation of Michigan
Filed Dec. 27, 1965, Ser. No. 516,514
12 Claims. (Cl. 51—163)



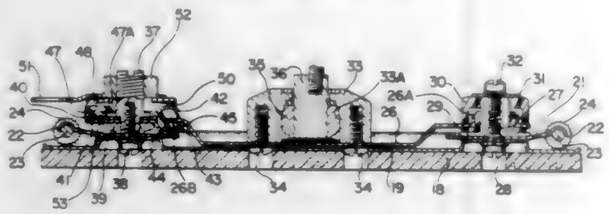
1. A workpiece finishing device comprising a tub adapted to have abrasive media dispersed loosely therein, a fixture having workpieces secured thereto and rotatably supported along a longitudinal axis within said tub, and drive means causing said tub and fixture to move in an orbital path transverse to said axis and said abrasive media to move through an orbital path within said tub thereby causing said fixture to rotate about said axis and move relative to said media.

3,371,450
APPARATUS FOR BALANCING ROTATING BODIES
Samuel S. Board, Jr., Woodbridge, Gene R. Gagliardi, Bethany, and Peter Hold, Milford, Conn., assignors to Farrel Corporation, Ansonia, Conn.
Filed Oct. 13, 1965, Ser. No. 495,569
17 Claims. (Cl. 51—169)



1. A grinding wheel assembly comprising in combination a spindle, means mounting a grinding wheel on said spindle, balancing weights in the form of first and second motors, means defining annular paths of movement for said motors coaxial with the axis of said spindle on said wheel mounting means, each of said motors having shaft-mounted means for driving said motors in said paths, and means for energizing said motors to drive said motors about said axis.

3,371,451
SHIFTING MECHANISM FOR DUAL-ACTION POWER-OPERATED ABRADING TOOL
Sherwood G. Enders, Bowley's Quarters, Md., assignor to The Black and Decker Manufacturing Company, Towson, Md., a corporation of Maryland
Filed Mar. 28, 1966, Ser. No. 538,004
7 Claims. (Cl. 51—170)



1. In a portable power-operated abrading tool having a housing, a platen resiliently mounted below the housing, a pivot arm between the housing and the platen, the pivot arm having a pair of ends, one of which is pivotally mounted on the platen and the other of which is free, a bearing mounted on the pivot arm intermediate its ends, and a driving eccentric journaled in the bearing along a vertical axis, whereby the pivot arm oscillates substantially in a horizontal plane above the platen, and whereby the platen has a straight-line reciprocation, the improvement which comprises:

(a) a bearing guide having a slot receiving the free end of the pivot arm;

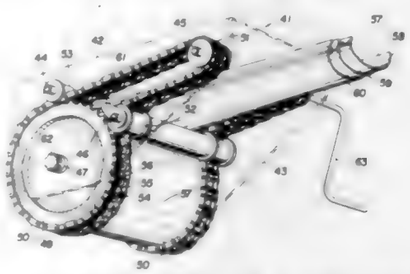
(b) means supporting the bearing guide on the platen and journaling the same for pivotal movement about a substantially horizontal axis, whereby the slot in the bearing guide angularly adjusts to the free end of the pivot arm; and

(c) means carried on the platen for selectively restraining the free end of the pivot arm against oscillation in a horizontal plane, whereby the straight-line reciprocation of the platen is converted to an orbital reciprocation.

3,371,452
DIAMOND SAW OR MILLING BLADES
Donald H. Mabey, Salt Lake City, Utah, assignor to Christensen Diamond Products Company, Salt Lake City, Utah, a corporation of Utah
Filed Feb. 8, 1965, Ser. No. 430,817
13 Claims. (Cl. 51—206)

A cutting saw device in which a circular disc is surrounded with a rim portion of matrix material having circumferentially spaced helical ridges of matrix material in which individual diamond cutting elements are embedded by being molded in and surrounded by the matrix material of the ridges.

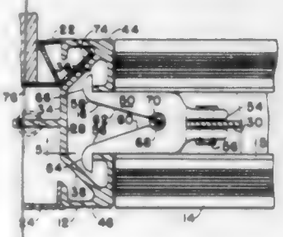
3,371,453
CASSETTE STEM DEVICE
Ernest Groskopfs, Toronto, Ontario, and John Arthur Fry, Willowdale, Ontario, Canada, assignors to The De Havilland Aircraft of Canada, Limited, Downsview, Ontario, Canada
Continuation-in-part of application Ser. No. 269,258, Apr. 1, 1963. This application Aug. 3, 1964, Ser. No. 387,163
5 Claims. (Cl. 52—108)



1. A cassette form of extensible and retractable stem device adapted to be driven during extension and retraction and comprising in combination: at least one stem strip of a length and width which when free defines a tube having a concave inner surface and of relatively small diameter as compared with its length the side edges of said strip being overlapped throughout the length of the tube and the width of said strip being greater than three times the diameter of the tube defined thereby; an inner cylindrical drum member having an axis of rotation; means anchoring one end of said strip substantially tangentially to said drum member to dispose the concave

inner surface thereof outwardly and adapting the full width of said strip to be reeled upon said drum in full contact of the convex surfaces of said strip therewith; encyclic retaining means at each end of said drum controlling the path of motion of the strip reeled on said drum through about 300 degrees of arc of a predetermined radius substantially greater than the radius of said drum and on a tangent line from one end of said arc extending in the same tangent direction as the tangential anchorage of said strip to said drum; a form roller engageable with the strip coiled between said drum and said encyclic means and located substantially at the point of tangency of said tangent line with said arc means for driving said drum for extension and retraction of said strip at the same velocity on said line of tangency; and a doctor member substantially at the nip of tangency of said strip and the coiled strip within said encyclic retaining means between the other end of said arc and said tangent line.

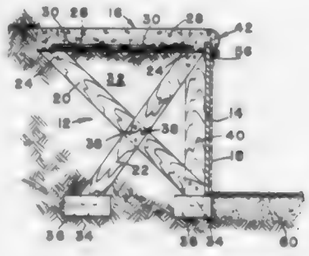
3,371,454
PARTITION STRUCTURE
Richard N. Anderson, Rome, Ga., assignor to V. E. Anderson Mfg. Co., Owensboro, Ky., a corporation of Kentucky
Filed Oct. 24, 1965, Ser. No. 504,537
12 Claims. (Cl. 52—122)



Partition structure capable of non-destructive erection including vertically extending posts and horizontally extending members having a cross section including an H-shaped central part, diagonal parts extending at forty-five degrees from the ends of the parallel portions of the H-shaped part and V-shaped parts secured at their apex to the free ends of the diagonal parts opening inwardly toward the center of the H-shaped part to define a square, a glazing channel for securing panels of different widths within the space between adjacent V-shaped parts of the cross section of the vertical posts and horizontal members, joint brackets for securing the vertical posts and horizontal members together at any location therealong at right angles to each other having a generally U-shaped elevation with diverging leg portions and a bifurcated closed end, a V-shaped recess in the other end thereof forming leg portions terminating in oppositely outwardly extending flange portions and means for varying the height of the vertically extending posts each including an adjusting block secured within the H-shaped central part of a post at the bottom thereof, a nut rigidly received in the adjusting block and a bolt extending through the nut from the bottom thereof.

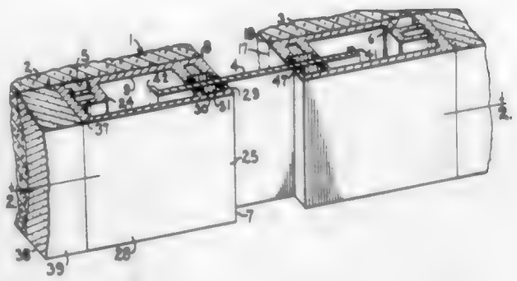
3,371,455
SWIMMING POOL STRUCTURE
George C. Fox, R.D. 3, Box 438, Dover, Pa. 17315
Filed Oct. 24, 1966, Ser. No. 588,957
10 Claims. (Cl. 52—169)

1. A swimming pool comprising sides formed from similar sheets of rigid material, means connecting the ends of said sheets together into adjoining side walls forming the interior confines of said pool, vertical studs spaced along the exterior of said wall and connected thereto, said studs being substantially coextensive with the height of said side walls, bracing means extending radially outward from each stud and comprising a pair of elongated members crossed intermediately of the ends thereof to form an X-frame positioned within a vertical plane, the upper and lower ends of said members at one side of said X-frame being connected to said studs adjacent the opposite ends thereof, a tension brace member extending between the upper ends of said members of each X-frame, footer means engaging the adjacent ground and fixed relative thereto and engaging the lower



outwardly projecting end of one of said members of each X-frame to prevent the same from moving relative to the ground, a deck extending horizontally between the upper ends of said X-frame members adjacent said tension brace members and around at least a portion of the circumference of the pool adjacent the upper edge of said side walls, and a waterproof flexible sheet liner covering the inner surfaces of said sides and extending downward from said deck and across the bottom defined substantially by the lower edge of said sides.

3,371,456
EXPANSION JOINT COVER
Claude P. Balzer, Edward M. Corman, and Almer A. Reiff, Wichita, Kans., assignors to Balco, Inc., Wichita, Kans., a corporation of Kansas
Filed June 1, 1965, Ser. No. 460,218
4 Claims. (Cl. 52—278)



This invention is in expansion joint cover structures to provide an attractive appearance at the expansion joints in building structures of monolithic concrete, concrete blocks, bricks and the like. The cover structure is such that it can be arranged with portions flush mounted relative to the surface of the adjacent wall and maintain the covering relation with the joint while permitting expansion and contraction plus right angle building movement. The cover structures are adapted to variations to cover expansion joints between building sections such as floors, floors and walls, walls and/or ceilings, and include base members for mounting on the structural members adjacent the margins thereof alongside of the joint and cover members for securing to the respective base members and cooperating therewith to define longitudinally extending openings

therebetween and an elongated plate member spanning the space between the base and cover assembly then extending through the longitudinal openings of the respective assemblies and slidable relative thereto, the structures having stop portions to limit relative movement of the plate member and the base and cover assemblies to maintain the plate member in its closing position. The structures may also include resilient members in the base and cover assemblies having slidable engagement with a plate member to resiliently retain same in the intermediate position and also resilient strips filling space between the cover members at the joint that is substantially flush with the outer face of the cover members. The expansion joint cover assemblies provide a sealing engagement with the movable portions whereby they can be mounted exteriorly or interiorly after the building structure has been completed and permit multiple directional relative movement of the building sections that the joint covered therewith.

3,371,457

STRUCTURAL PART MADE OF PLASTIC MATERIAL

Michael Wienand, Siegburg, Germany, assignor to Dynamit Nobel Aktiengesellschaft, Troisdorf, Germany

Filed Sept. 8, 1964, Ser. No. 394,657
Claims priority, application Germany, Sept. 7, 1963, D 27,520, D 27,521
17 Claims. (Cl. 52—404)

17. A structural part of plastic material for roof covers, wall coverings, or the like comprising:

plate-like structure having a plurality of edge portions and provided with approximately U-shaped hook means within the area of two edge portions extending toward opposite sides of the plate-like structure,

said hook means including free leg portions of such shape that the width of a respective hook means initially decreases slightly in the direction toward the end of the respective free leg portion and then again increases, and the width of the hook means being so dimensioned that similar structural parts may be interconnected by the hook means thereof,

the plate-like structure including two identical plate like parts combined with each other to form a structural part, each of said two identical plate-like parts being provided with a relatively wide hook means pointing toward one side and with a relatively narrow hook means pointing toward the opposite side, the outer surface of the free leg portion of a respective narrow hook means closely abutting against the inner surface of the free leg portion of a respective wide hook means with the inner and outer surfaces covering about equal area,

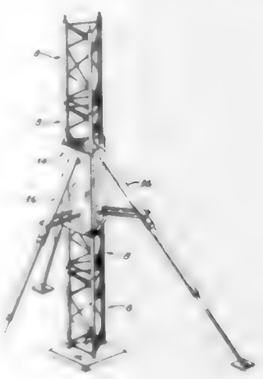
and the space between the two plate-like parts being filled with insulating material.

3,371,458

STRUCTURAL UNIT

Lester G. Sturgill, Leesburg, Va., assignor to Atlantic Research Corporation, Fairfax County, Va., a corporation of Virginia

Filed June 30, 1966, Ser. No. 561,953
10 Claims. (Cl. 52—648)



1. A structural unit for building an elongated structure comprising a first section, a second section, and a third section, all of said sections being of identical configuration and each of said sections comprising:

a hollow tube having a first diameter,

a rod laterally spaced from and parallel to said tube, said rod having a second diameter less than said first diameter,

a slot longitudinally aligned through said tube and traversing the entire length thereof, said slot having a width less than said second diameter,

means for attaching said rod to said tube, said means being fixedly attached at one end to said rod and at the other end to said tube at an angular distance of 60° from said slot;

the rod of said first section being inserted into the tube of said second section such that the attaching means of said first section pass through the slot of said second section; the rod of said second section being inserted into the tube of said third section such that the attaching means of said second section pass through the slot of said third section, and the rod of said third section being inserted in the tube of said first section such that the attaching means of said third section pass through the slot of said first section.

3,371,459

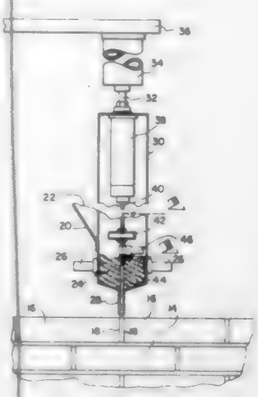
MORTAR JOINT PLACEMENT DEVICE

Paul M. Thomas, 5630 E. Edgewood Road, Phoenix, Ariz., and Lawrence W. Wright, Scottsdale, Russell W. Burge, Glendale, and Eugene E. Crile, Phoenix, Ariz.; said Wright, said Burge, and said Crile assignors to said Thomas

Filed Nov. 26, 1963, Ser. No. 326,293
10 Claims. (Cl. 52—749)

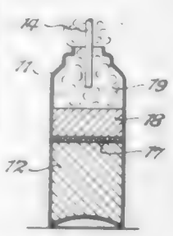
1. In a mortar joint placement device the combination of: means for holding mortar having an outlet disposed to direct mortar downwardly; a tubular structure at said outlet disposed to conduct mortar and hold mortar therein, said tubular structure of a dimension capable of being projected downwardly between spaced vertical surfaces of adjacent concrete blocks; means for moving said tubular structure upwardly and downwardly; and an ejector member disposed closely to fit the interior of said tubular

structure and means causing said tubular structure when retracted upwardly from a space between vertical spaced



surfaces of concrete blocks to move over said ejector plunger and to cause mortar to be dispensed between said adjacent vertical surfaces.

3,371,460
METHOD OF FILLING AEROSOL CONTAINERS AND THE LIKE
Joseph M. Rait, 95 Huxley Drive, Snyder, N.Y. 14226
Filed Sept. 21, 1965, Ser. No. 488,959
17 Claims. (Cl. 53—25)



5. A method of charging a container partially filled with a first liquid wherein a second low-boiling liquid is added without appreciable loss through vaporization, boil-off and frothing comprising the steps of:

(a) contacting the upper surface of said first liquid with a volatile liquid freezing means having a much lower temperature than said first liquid thereby freezing said upper surface to a relatively thin, substantially solid, frangible, meltable barrier

(b) introducing said second liquid to upper side of said barrier, said second liquid having a boiling point lower than the freezing point of said first liquid,

(c) sealing off the contents of said container from communication with the atmosphere in at least a temporary manner.

3,371,461
METHOD AND APPARATUS FOR CHARGING A PACKET OR CONTAINER WITH A FLOWABLE MATERIAL
Theodore F. Aronson, 60 Crescent Road, Glen Cove, N.Y. 11542
Filed Oct. 15, 1964, Ser. No. 404,082
21 Claims. (Cl. 53—28)

1. A method of continuously forming and filling a packet with a predetermined measured amount of flowable material comprising the steps of,

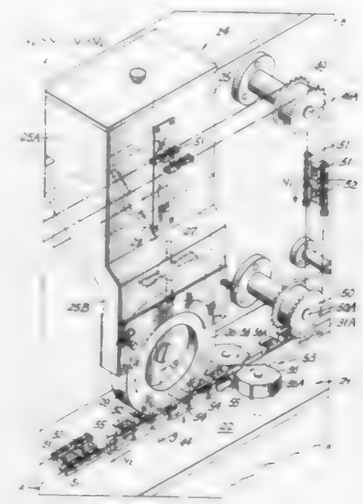
continuously folding a strip of material about a longitudinally extending fold line to define a web having reversed folds,

positioning the discharge ends of a moving line of funnels between the folds of said web,

forming said web into a plurality of connected packets by seaming the reversed folds of said web together at transversely spaced intervals between the adjacent discharge ends of said moving line of funnels,

successively charging each of said moving funnels and the connected packet associated therewith with a predetermined charge of said material,

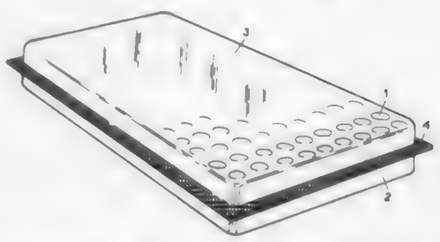
successively moving the respective funnels from their respective packets of said moving line of packets after the flowable material has passed therethrough and settled in said packet,



successively sealing the open ends of said connected packets to confine the flowable material therein by forming a continuous seal extending along the edges of the reverse folds of said web of material opposite said fold line, and

severing the endmost packet from the continuous moving line of packets after said packets have been sealed and collecting said severed packets.

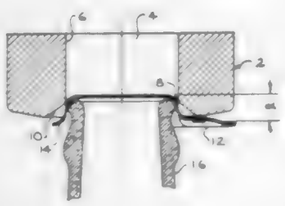
3,371,462
METHOD OF PACKING A NUMBER OF CONTAINERS IN ONE UNIT
Allan Nordkvist and Jack Nordqvist, both of Surte, Sweden
Filed Dec. 10, 1964, Ser. No. 417,305
Claims priority, application Sweden, Dec. 10, 1963, 13,678/63
5 Claims. (Cl. 53—33)



Disclosed herein is a method of packing in one unit a number of containers including placing first and second foils of heat shrinkable material above and below the containers, folding the foils toward each other and welding the periphery of the foils together. The welded together peripheral portions of the foils are heat shrunk into force-exerting relationship to the outermost containers. The foils are further heat shrunk at selected locations therein to further insure that the containers are tightly maintained within the covering so formed.

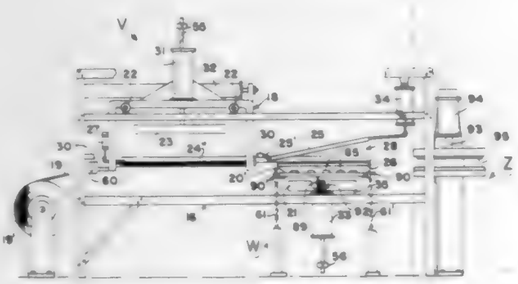
Further disclosed herein is the packaging unit formed in accordance with the above-outlined method.

3,371,463
METHOD FOR CRIMPING CROWN CAPS
George E. Roberts, New York, N.Y., assignor to United States Crown Corporation, Saddle Brook, N.J., a corporation of Delaware
Filed Feb. 4, 1965, Ser. No. 430,379
2 Claims. (Cl. 53—42)



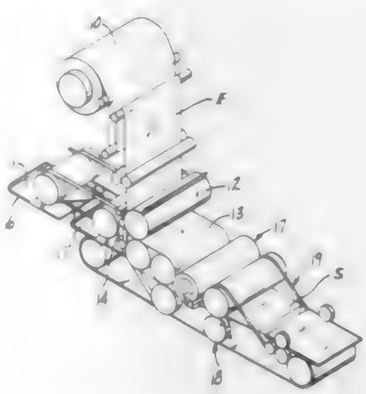
There is disclosed a method of application of forces to crimp a crown cap and/or a crown cap having an initially generally horizontally radially extending tab. The method permits the positioning of the cap in any radially oriented position on the top of the neck of the container to which it is to be crimped. There is simultaneously applied forces to the top edge of the cap and to the top of its tab at points lying on a force applying locus extending through the top edge application of force position on the cap and lying 45 to 60 degees from the vertical axis through the cap as measured in a direction below the tab and towards the container axis. Continuing with the application of these forces while applying an inwardly directed radial force around the wall of the cap to bend it in while bending the tab downwardly and into an upwardly convex shape as viewed in cross section to fully crimp the wall into locking engagement with the neck and further deform the tab downwardly and inwardly towards the container.

3,371,464
SKIN PACKAGING APPARATUS
Joseph S. Swick, 116 E. Mosholu Pkwy., Bronx, N.Y. 10471
Filed Oct. 15, 1965, Ser. No. 496,563
5 Claims. (Cl. 53—112)



1. In combination in an apparatus for skin-packaging at least one article positioned on an air-pervious card by applying vacuum action to draw a heated thermoplastic sheet atop said laden card, a frame, a vacuum box having a perforated top wall and an inlet for connection to a vacuum supply, mounted on said frame, sheet holding means on said frame, for receiving and releasably spanning a heated thermoplastic sheet, opposite and directly above said vacuum box, two endless conveyor belts positioned in spaced vertical planes on wheel means on the frame and arranged for simultaneous identical movement on said wheel means; said vacuum box being intermediate said belts and free for vertical movement therebetween, perforated trays spanning said belts, each adapted to hold a card thereon having at least one article thereon which is to be skin-packaged; said trays being equi-spaced along the entire length of said belts; one of said trays being directly intermediate and spaced from said vacuum box and sheet holding means; said belts and each tray having cooperative means locating and releasably holding the tray; each tray being liftable off said belts when on the upper flights of said belts; said vacuum box having a horizontal channel thereacross in a direction parallel to the planes of said belts; entrance down into said channel being from the top surface of the vacuum box, an element extending downwardly from the tray into said channel, means on the vacuum box within said channel adapted to engage said element upon downward movement of said vacuum box, whereby the tray is lowered; said element being free for movement into, along and out of said channel upon movement of said conveyor belts, means to raise the vacuum box whereupon the tray is lifted off the belts and raised upwardly a predetermined distance past the sheet-occupying plane in said sheet holding means and to then lower the vacuum box to its initial position whereby during such descent of the vacuum box, it will restore the tray it raised off the belts, back onto said belts, and means to move said conveyor belts a distance equal to the equi-spacing of the tray locating means on said belts.

3,371,465
FLEXIBLE COVER APPLICATOR
Frank A. Grant, San Mateo, Calif., assignor, by mesne assignments, to F. A. Grant, doing business as Hoefer Machine Works, San Francisco, Calif.
Filed Aug. 17, 1965, Ser. No. 480,359
2 Claims. (Cl. 53—333)

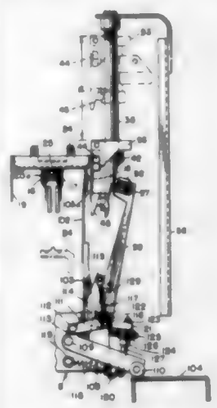


1. In a machine for applying a sheet of flexible covering material to the open top of a continuously advancing container having a projecting lip around its periphery defining leading, trailing, and side lips including means for folding and tucking leading and trailing margins of covering material under the leading and trailing lips with opposed ends of said margins untucked, the improvement comprising: a movable member mounted for circular motion about an axis traversing said tray located in line with one side lip and downstream of said folding and tucking means, the circular motion of said member being synchronized with respect to the advance of the tray so that the member moves upwardly into contact with one of said ends operative to fold and tuck said end under said one side lip.

3,371,466
WRAPPING MACHINE
King L. Klopfenstein, Prospect Heights, Ill., assignor to Triangle Package Machinery Company, Chicago, Ill., a corporation of Illinois
Filed Jan. 19, 1965, Ser. No. 426,507
10 Claims. (Cl. 53—206)

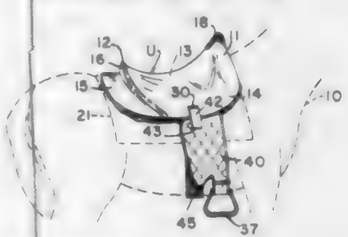
A package wrapping machine for applying a diamond wrap, wherein the package is manually prewrapped, then

placed in the machine, and the extending ends of the wrap are folded downwardly and then inwardly under



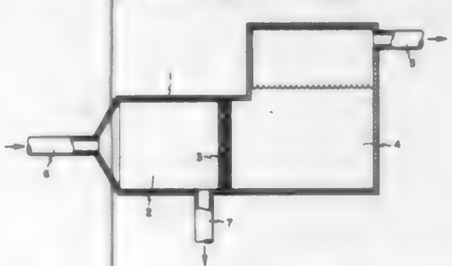
the bottom of the package and spot sealed thereto while the package is at rest in its intermittent movement.

3,371,467
SADDLE
George R. Salisbury III, Carbon County, Wyo. (Slater, Colo. 81653)
Filed Oct. 26, 1964, Ser. No. 406,380
18 Claims. (Cl. 54—44)



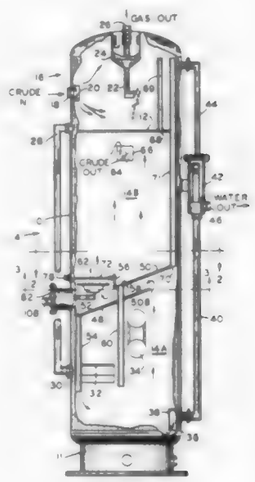
1. A saddle comprising:
a lower shell adapted to rest on the back of a horse;
an upper shell having a seat for a rider and spaced from said lower shell over a substantial portion thereof; and
means joining said shells together around the edges thereof.

3,371,468
BARRIER SEPARATOR
Joseph A. Shropshire, Westfield, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Continuation of application Ser. No. 362,007, Apr. 23, 1964. This application July 8, 1966, Ser. No. 563,923
3 Claims. (Cl. 55—158)



An apparatus comprising a gas-tight container separated into two chambers by a porous barrier made up of a particulate combination of hydrophobic polymers or waterproofed asbestos and hydrophilic material such as carbon, alumina, charred wood, paper, shredded paper, or plant fibers, one chamber of which is adapted to contain an aqueous inorganic acid base or salt solution or amino acids and one chamber adapted to contain a mixture of gases, has been found to accomplish a selective separation of gaseous mixtures.

3,371,469
EMULSION TREATER
Forrest L. Murdock, 2420 E. 24th, Tulsa, Okla. 74114
Filed Oct. 18, 1965, Ser. No. 496,967
8 Claims. (Cl. 55—175)

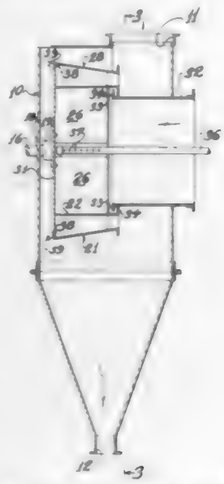


1. An emulsion treater for crude oil comprising:
an upstanding closed vessel having a water outlet adjacent the bottom thereof;
a horizontal baffle means dividing said vessel into an upper and lower quiescent chamber, said baffle being partly defined by an imperforate portion, and partly by a pair of spaced upper and lower horizontal grids through which crude oil passes flowing from said lower to said upper chamber;
means to electrically charge one of said upper and lower grids relative to the other;
a crude oil inlet in said vessel communicating with said lower chamber;
a crude oil outlet in said vessel communicating with the upper portion of said upper chamber; and
said baffle means imperforate portion being a substantially semi-elliptical planar member defined by a straight edge and an arcuate edge, the arcuate edge thereof being in engagement with the internal wall of said vessel, said imperforate portion sloping downwardly from the arcuate edge at the vessel interior wall to the straight edge adjacent the center of the vessel, and including a planar vertical support member affixed at each end thereof to the interior wall of the vessel and having the lower edge thereof affixed to said straight edge of said imperforate portion, said imperforate portion and said vertical support member defining a trough extending from wall to wall within said vessel, said upper grid being supported between said vertical support member and the interior wall of said vessel opposite said imperforate portion.

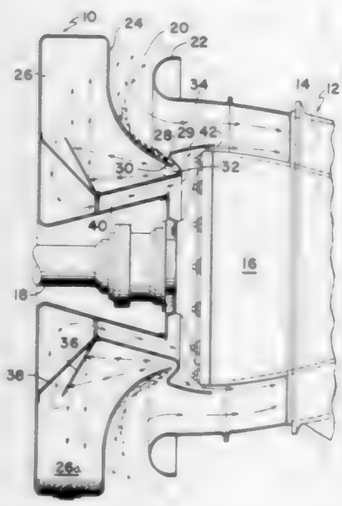
3,371,470
APPARATUS FOR SEPARATING ENTRAINED MATERIALS FROM GASES
Ellis W. Bullock, Birmingham, Ala., assignor to The Fly Ash Arrestor Corporation, a corporation of Alabama
Filed Jan. 25, 1966, Ser. No. 522,893
1 Claim. (Cl. 55—231)

Separator apparatus having a cylindrical member mounted within and spaced from an imperforate, frustoconical casing. A closure member closes the larger diameter end of the casing and the adjacent end of the cylindrical member leaving the opposite end of the casing open for gas discharge. The cylindrical member rotates with the casing and has venturi-like orifices therethrough. Vanes

divide the casing and cylindrical member into a plurality of angularly spaced compartments and openings adjacent the larger diameter end of the casing discharge materials separated from gas.

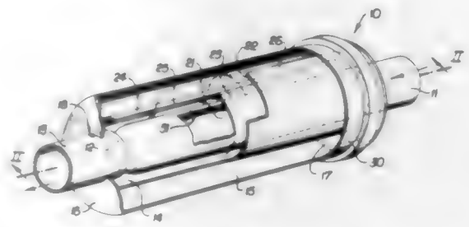


3,371,471
SAND AND DUST COLLECTOR FOR ENGINE AIR INLETS
Harold D. Connors, Milford, Conn., assignor to Avco Corporation, Stratford, Conn., a corporation of Delaware
Filed Oct. 15, 1965, Ser. No. 496,287
2 Claims. (Cl. 55—306)



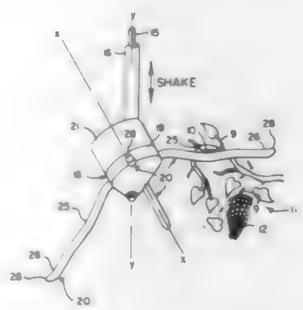
A means to separate and collect foreign particles from air entering air inlets to gas turbine engines. The air passage to the engine air inlet is provided with a curved wall positioned to receive air and particle contact. Adjacent an inner edge of this wall an adjacent wall is provided to direct separate particles and a portion of the air into an adjacent collection region and into an auxiliary air passage to complete the separation. The auxiliary air passage provides a carrying air stream allowing the main stream to continue, the auxiliary stream to be again directed into the inlet after foreign particle separation is completed. The projecting wall serves not only as the means to collect and deflect separated particles but also has an extending portion inside the collection region serving to form a part of an auxiliary passage. An extending portion of this wall toward the air inlet forms one wall of the air passage carrying a major portion of the air flow entering the engine and serves also as a portion of the auxiliary air channel exhausting air into the main flow passage thereby to induce air flow in the auxiliary passage.

3,371,472
SPARK ARRESTER
John Krizman, Jr., 10549 Monogram Ave., Granada Hills, Calif. 91344
Filed Dec. 8, 1965, Ser. No. 512,457
3 Claims. (Cl. 55—399)



A spark arrester for internal combustion engines, having axially aligned inlet and outlet tubes, the inlet tube having a closed end extending into a casing, and a spiral spark arrester around the inlet tube in the casing arranged to receive a portion of incoming gases, and means for passing another portion more desirably to the outlet tube to preclude buildup of excessive back pressure.

3,371,473
MECHANISM FOR HARVESTING FRUIT FROM VINES
Charles G. Burton, Lewiston, N.Y., assignor to Chisholm-Ryder Company, Inc., Niagara Falls, N.Y., a corporation of New York
Continuation-in-part of application Ser. No. 449,974, Apr. 22, 1965. This application Nov. 28, 1966, Ser. No. 597,325
4 Claims. (Cl. 56—330)



In harvesting grapes a hub freely rotatable about an upright axis has been moved along the cordon wire and reciprocated or shaken generally vertically and provided with fixed radial arms which successively walk through the vines from the side and engage the underside of the wire. The present improvement is in the shape of these arms to retain engagement with the bottom of the wire for a longer time, this being accomplished by making their upper sides of longitudinally undulating form. By cordon wire is meant the generally horizontal wire supported by and generally parallel with the grape posts to which the cordons or trunks of the vines extend and along which the canes are trained.

3,371,474
METHOD AND APPARATUS FOR FORMING ARMORED CABLES
William E. Bowers, Houston, Tex., assignor to Schlumberger Technology Corporation, Houston, Tex., a corporation of Texas
Filed Apr. 21, 1966, Ser. No. 544,156
10 Claims. (Cl. 57—15)

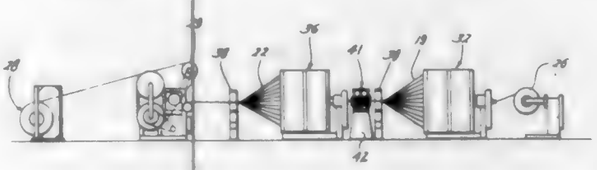
1. An apparatus for making armored cable having at least two oppositely wound spiral layers of armor wire

strands surrounding a central core, comprising in combination:

payout means for paying out the central core along a predetermined line of travel;

cable take up means spaced apart from the payout means and along the line of travel for pulling the core along said line of travel;

first wrapping means spaced between the payout means and the take up means for applying a first layer of armor wire strands about the core in a first spiral direction;



a second wrapping means spaced between the first wrapping means and the take up means for applying a second superposed layer of armor wire strands around the first layer in a generally opposite spiral direction;

and pulling means mounted between the first and second wrapping means for pulling on the core and first layer of armor wire strands in the direction of travel thereof, to thereby reduce tension force thereon as the cable passes thereby.

3,371,475

BULKY, HIGH-STRENGTH POLYETHYLENE TEREPHTHALATE YARNS

Adly Abdel-Moniem Gorrafa, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Sept. 20, 1965, Ser. No. 488,788

4 Claims. (Cl. 57—140)

A spun yarn of polyethylene terephthalate having a twist multiplier of from 1.4 to 2.0 and consisting of textile fibers of less than 2.0 denier per filament having measured staple lengths of from 2.25 to 3.0 inches. Blends of polyethylene terephthalate with minor portions of rayon and with minor portions of cotton are also disclosed. The yarn possesses high bulk and covering power with a good degree of strength.

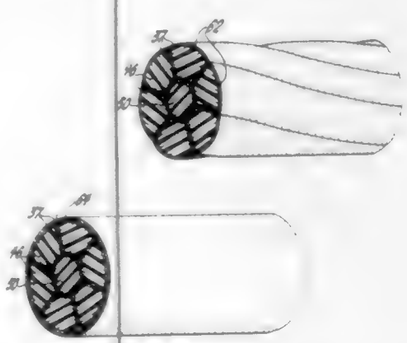
3,371,476

GLASS PLASTIC ROPE

Robert B. Costello and Gilbert B. Graham, Santa Barbara, Calif., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Apr. 2, 1965, Ser. No. 445,160

4 Claims. (Cl. 57—149)



The present invention is a glass rope having untwisted strands which are first coated with a lubricant and then with a thermosetting resin. The thus formed strands are then curved and twisted about a core to form a rope.

3,371,477

MANUFACTURE OF TEXTILE PRODUCTS IN THE FORM OF THREADS, CORDS, ROPES AND OTHER SIMILAR ARTICLES FROM FILMS OF ORIENTED SYNTHETIC LINEAR POLYMERIC MATERIAL

Pierre Felix, Miribel, France, assignor to Societe Rhodiaceta, Paris, France, a French body corporate

No Drawing. Filed Feb. 1, 1966, Ser. No. 523,914

Claims priority, application France, Feb. 12, 1965, 5,397

10 Claims. (Cl. 57—157)

1. A process for the manufacture of textile products in the form of threads, ropes, cords and like articles, which comprises fibrillating an oriented film of a linear synthetic polymeric material by vigorously projecting onto the film, while it is stretched out and under tension, at least one jet of fine solid particles, and twisting the resulting fibrillated film.

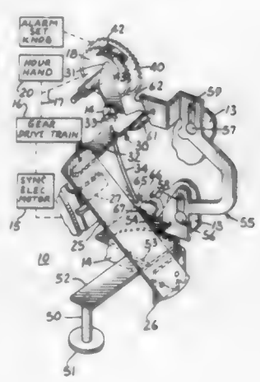
3,371,478

ALARM CLOCK HAVING TOUCH TYPE SHUT-OFF

Ralph C. Robinson, Athens, Ga., assignor to General Time Corporation, Stamford, Conn., a corporation of Delaware

Filed Nov. 10, 1966, Ser. No. 593,350

3 Claims. (Cl. 58—21.15)



An electric alarm clock including a shut-off arrangement in which slight downward pressure on the housing actuates a blocking lever which coupled to a vertical slide and an alarm control lever shuts off the alarm.

3,371,479

HYDROSTATIC TRANSMISSION AND CONTROL THEREFOR

Robert E. Yapp, Solihull, and Edward G. Metcalfe, Cubbington, Leamington Spa, England, assignors to Massey-Ferguson Services N.V., Curacao, Netherlands Antilles, a corporation of the Netherlands Antilles

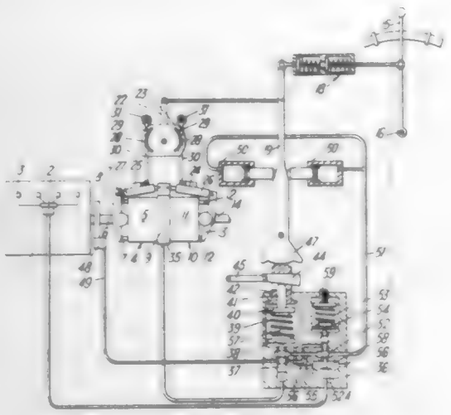
Filed Jan. 19, 1966, Ser. No. 521,717

Claims priority, application Great Britain, Jan. 28, 1965, 3,868/65

9 Claims. (Cl. 60—19)

A hydrostatic transmission having a control to reduce the speed ratio during overload including a servo system

responsive to the drop in pressure across the transmission motor. Compensation means are provided to correct for



the fact that the pressure drop across the motor varies with the speed ratio at any given torque value.

3,371,480

ONE AND ONE-HALF STAGE SPLIT TURBINE CONSTRUCTION

Jules E. Page, Wapping, and Harold E. Rock, Hartford, Conn., assignors to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Filed June 16, 1966, Ser. No. 558,090
6 Claims. (Cl. 60—39.16)

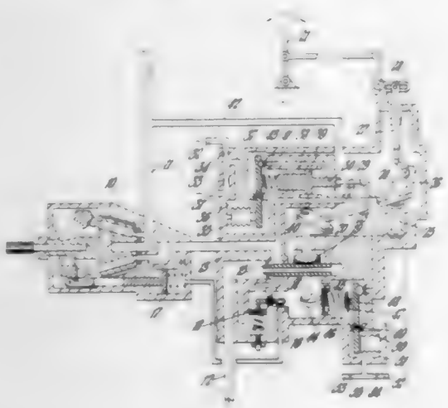
A one and one-half stage split turbine construction wherein the turbine operates efficiently at full power and wherein the turbine efficiency is maximized at the partial admission condition when alternate gas generators are shut down.

3,371,481

FUEL SYSTEMS FOR GAS TURBINE ENGINES

Eugene Harold Warne, Shirley, Solihull, England, assignor to Joseph Lucas (Industries) Limited, Birmingham, England

Filed Nov. 8, 1966, Ser. No. 592,901
4 Claims. (Cl. 60—39.28)



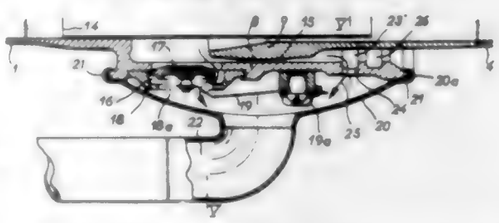
1. An acceleration control for a gas turbine engine fuel system comprising a throttle, a manual control for the throttle, a further device also for controlling the throttle, said further device being responsive to changes in pressure conditions within the engine with which the system is associated, a cam connected to the throttle so as to be movable therewith, a spring acting between the cam and a valve member, means responsive to changes in the speed of the engine and acting upon the valve member in opposition to the spring, the valve member being arranged to modify the response of said pressure conditions upon the further device for controlling the throttle.

3,371,482

JET PROPULSION CASINGS HAVING FUEL DRAINAGE MEANS

André Alphonse Médéric Léon Camboulives, Billancourt, Seine, and Roger Alfred Jules Vandenbroucke, Antony, France, assignors to Societe Nationale d'Etude et de Construction de Moteurs d'Aviation, Paris, France, a company of France

Filed June 10, 1966, Ser. No. 556,613
Claims priority, application France, June 14, 1965, 20,686
10 Claims. (Cl. 60—39.32)



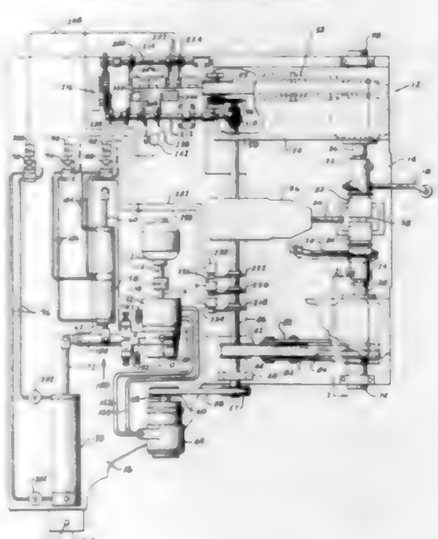
An articulated joint between ducts forming the joining elements of an outer casing for a jet propulsion unit, having fuel recovery means comprising a drainage orifice forming a valve seat in a lower portion of the female flange of the joint, a valve member which is applied against the seat by the pressure prevailing in the ducts when the unit is running, against the action of a biasing force, and a sump device for receiving liquid fuel flowing through the valve seat.

3,371,483

HYDRAULIC CONTROL SYSTEM

Robert C. Gray, New Carlisle, and Lawrence A. Shively and Otto F. Steinke, Dayton, Ohio, assignors to The Globe Tool and Engineering Company, Dayton, Ohio, a corporation of Ohio

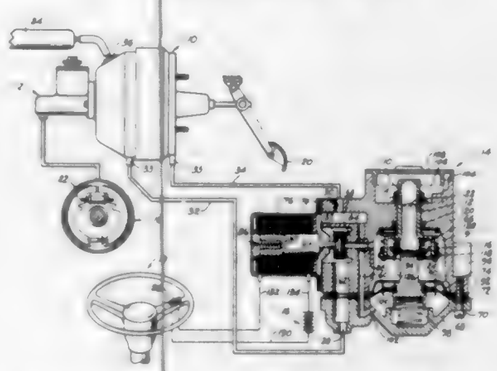
Filed May 23, 1966, Ser. No. 552,006
16 Claims. (Cl. 60—53)



1. In a winding machine, a drive mechanism comprising: a rotatable shaft; a hydraulic motor having an output shaft drivingly connected to said rotatable shaft; a

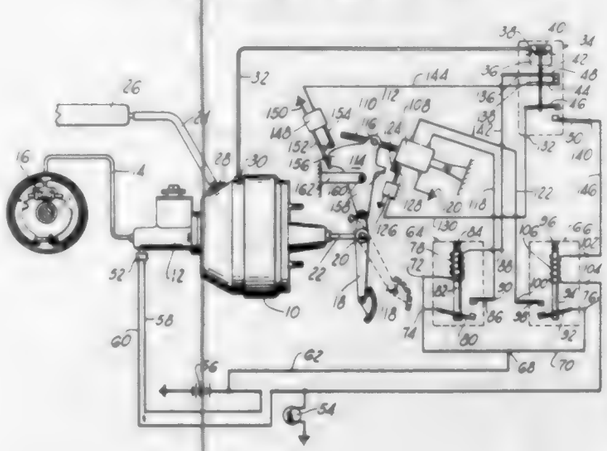
hydraulic pump hydraulically connected to said motor, said pump including a rotatable control stem which may be rotated about a predetermined axis to vary the speed and direction of rotation of said motor; a speed control device including a control lever connected to said stem, first means for selectively rotating said lever through a predetermined angle about said axis in either one direction or the opposite direction about said axis, and second means for rotating said lever through an additional angle in at least one of said directions; and means including switch means operating in response to rotation of said rotatable shaft controlling the operation of said first means and said second means.

3,371,484
PEDAL AND BUTTON ACTUATED BRAKE SYSTEMS
Thomas M. Julow, South Bend, Ind., assignor to The Bendix Corporation, a corporation of Delaware
Filed Mar. 14, 1966, Ser. No. 533,885
5 Claims. (Cl. 60—54.5)



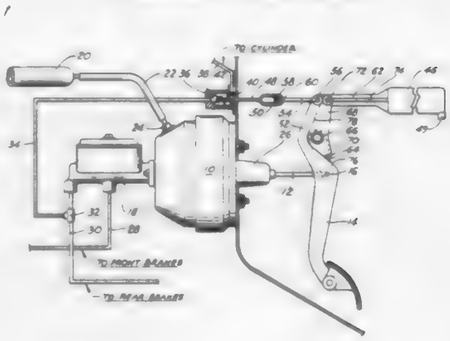
A remotely controlled valve operatively connected to a mechanically operated servomotor having tandem movable walls at least, which valve has means to sense the control chamber pressure for one of the walls as a reference to operation of the other of the walls.

3,371,485
MEANS TO VARY TRAVEL FOR AN OPERATOR-CONTROLLED LEVER OR PEDAL
Robert E. Reichard, South Bend, Ind., assignor to The Bendix Corporation, a corporation of Delaware
Filed July 15, 1966, Ser. No. 565,492
8 Claims. (Cl. 60—54.5)



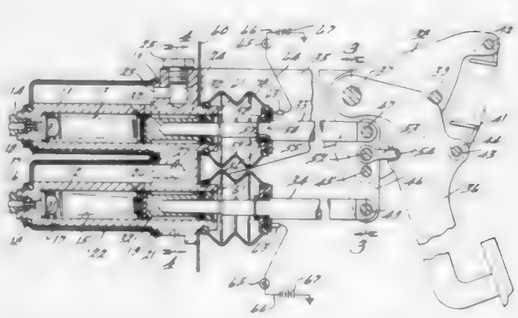
8. A brake mechanism comprising:
a fluid pressure servomotor including a push rod;
a first means pivotally connected to said push rod intermediate the ends of said means, one end of which is provided with an operator control member;
a pivotally mounted second means having an end connected to the other end of said first means;
a reversible motor having a means to change rotary motion to linear motion connected to said second means at another end thereof; and
actuating means for said motor sensitive to actuation of said push rod and pressure within said servo motor.

3,371,486
BRAKE PEDAL MOUNTING MEANS
Robert R. Hager, South Bend, Ind., assignor to The Bendix Corporation, a corporation of Delaware
Filed Sept. 26, 1966, Ser. No. 581,996
9 Claims. (Cl. 60—54.5)



1. A mounting means for an operator-operated control member, said means comprising:
a shaft;
a first lever pivotally mounted on said shaft, said first lever having an abutment surface depending from said shaft and an oppositely extending leg;
a second lever fixed on said shaft;
a third lever pivotally connected to said second lever; and
an actuator having a housing and an actuator rod, said housing being connected to said third lever and said rod being connected to said first lever.

3,371,487
DIVIDED MASTER CYLINDER
William Stelzer, Bloomfield Hills, Mich., assignor to Kelsey-Hayes Company, a corporation of Delaware
Filed Aug. 15, 1966, Ser. No. 572,360
12 Claims. (Cl. 60—54.6)

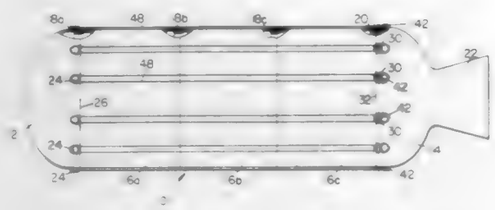


1. In a pressure generating device for a dual master cylinder which is capable of applying differential pressure to the front and rear brake cylinders, a support for a pivot on which a foot pedal is movable, lever means supported on said pivot and engageable with said foot pedal, spring means normally retaining said lever means in engagement with said foot pedal when initial force is applied to the latter, and means actuated when the force applied to the foot pedal is great enough to overcome the spring means for applying a differential pressure to the front and rear brake cylinders.

3,371,488
SEGMENTED ROCKET MOTOR

James R. Turner, Ogden, Utah, assignor to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware

Filed Feb. 23, 1966, Ser. No. 529,497
3 Claims. (Cl. 60—200)

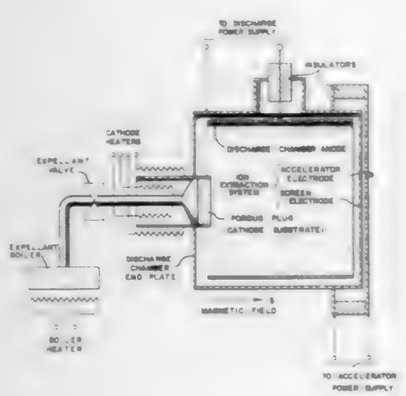


1. A rocket motor comprising a tubular casing, a forward end closure the peripheral edge of which matingly abuts one end of said casing, an aft end closure the peripheral edge of which matingly abuts the other end of said casing, said aft end closure having at least one thrust nozzle mounted thereon, a plurality of first support lugs fixedly mounted on the exterior surface of one of said end closures and spaced circumferentially thereof, a plurality of screws rotatably mounted on the exterior surface of the other of said end closures and spaced circumferentially thereof, a plurality of second support lugs respectively mounted on said screws, and a plurality of cables each attached to one of said first support lugs and to one of said second support lugs, whereby said screws can be turned to move said second support lugs away from said first support lugs to thereby secure said end closures fixedly to said casing.

3,371,489
POROUS-PLUG LOW WORK-FUNCTION FILM CATHODES FOR ELECTRON - BOMBARDMENT ION THRUSTORS

Wilfried O. Eckhardt, Malibu, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware

Filed Oct. 23, 1964, Ser. No. 406,078
7 Claims. (Cl. 60—202)

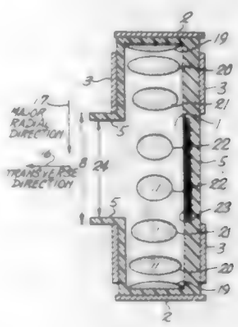


A cathode for use in an electron bombardment ion engine comprising a porous plug of tungsten and means for feeding cesium therethrough to produce a thin film of cesium thereon. The plug is heated sufficiently to thermionically expel electrons therefrom and to evaporate cesium atoms therefrom but not sufficient to expel cesium ions therefrom. This porous plug thus acts both as the source of ionizing electrons and as the supply for neutral propellant atoms.

3,371,490
MAGNETODYNAMIC PLASMA ACCELERATOR DEVICE

Ralph L. Haslund, Mercer Island, Wash., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware

Continuation-in-part of application Ser. No. 283,867, May 28, 1963. This application Nov. 17, 1966, Ser. No. 595,239
3 Claims. (Cl. 60—202)

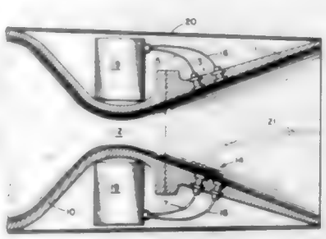


A pulsed induction plasma accelerator is described wherein separate means are used to form the plasma and to impart an accelerating force to it. The structural means defining a gas ionization chamber having an axis of symmetry has a plurality of circular bands through which a time varying primary current is passed. The primary current induces an electric field which causes the ionization of a neutral gas contained within the ionization chamber, changing that gas to a current conducting plasma. Due to the interaction of the plasma current with the primary magnetic field, with its self magnetic field, and with its self-induced electric field, the plasma contracts about the axis of symmetry and is finally accelerated out of the chamber under the influence of a separately energized acceleration coil. The acceleration coil is positioned such that when energized, it generates a planar radial magnetic field in the vicinity of the contracted plasma and extending radially outward from the axis of symmetry of the ionization chamber.

3,371,491
THRUST DIRECTION MODIFICATION MEANS

George R. Pinter, Hicksville, N.Y., assignor to Aerojet-General Corporation, Azusa, Calif., a corporation of Ohio

Filed Mar. 9, 1966, Ser. No. 532,981
8 Claims. (Cl. 60—230)



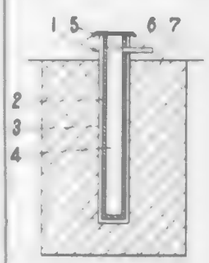
1. A reaction propulsion motor comprising: (a) a combustion chamber for burning fuel and producing combustion gases, (b) a convergent-divergent exhaust nozzle operably associated with said combustion chamber for receiving said combustion gases and to accelerate said combustion gases to supersonic velocities, and (c) means for electrically heating a portion of the inner surface of said exhaust nozzle so as to create a disturbance in the region adjacent to the area heated resulting in a shock wave which produces a controllable deviation from straight line flight.

3,371,492

FOUNDATION UTILIZING OSMOTIC PRESSURE

Tadashi Mise, 1, 1-chome Yatabecho-Nakadori, Yata, Higashisumiyoshi-ku, and Takeo Suzuki, 283–9 Kidocho, Kawachinagano-shi, both of Osaka, Japan

Filed Aug. 31, 1965, Ser. No. 484,001
Claims priority, application Japan, Sept. 5, 1964, 39/50,931; Mar. 2, 1965, 40/12,003; Mar. 15, 1965, 40/15,178
7 Claims. (Cl. 61—10)



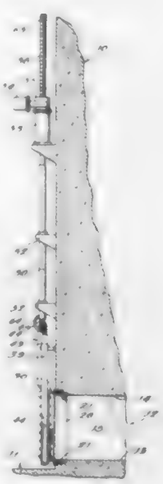
Method and apparatus for soil stabilization comprising inserting a drain chamber into water containing soft clay ground. Water in soil is drained from the soft clay ground through a semi-permeable membrane forming part of the drain chamber into the interior of the drain chamber due to the effect of the difference of osmotic pressure across the membrane. The drain chamber comprises a semi-permeable membrane surrounding a supporter, and has an aqueous solution of a water soluble solute in the interior of the chamber.

3,371,493

SLUICE GATE WITH INFLATABLE RUBBER SEAL

William J. Woolley, Oak Park, Ill., assignor to Henry Pratt Company, a corporation of Illinois

Filed Dec. 14, 1964, Ser. No. 418,052
3 Claims. (Cl. 61—28)



1. A sluice gate structure for attachment to an exposed face of a thimble mounted in a wall, comprising:

a guide and closure unit having a pair of spaced upright guide rails and a closure loosely mounted for movement transversely of the faces of said closure and for linear movement between and along the guide rails, one face of said closure having a flat face immediately inside the guide rails and surrounding the central portion of the closure, said guide rails having stop means engageable with the face of said closure opposite said one face to limit the movement transversely of said flat face when the closure is positioned to seal against fluid flow;

a tubular base structure having an internal flow passage for fluid and outwardly extending structural parts for receiving said guide and closure unit, said guide rails being removably attachable to the base structure with externally operable attachment means, said base structure having a flange with an abutment face surrounding said passage and directly facing said flat face when the closure is positioned to seal the fluid flow;

an inflatable seal member carried on at least one of the closure flat face and the flange abutment face and extending peripherally of the flow passage inside said rails, said seal being inflatable when the closure is positioned over the passage to seal the periphery of the passage between the closure and base structure;

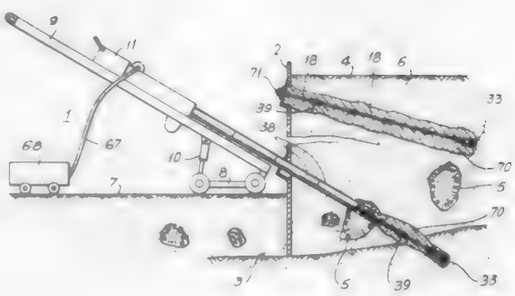
and externally operable attachment means for securing said base structure to said thimble to align said fluid passage with the thimble and position said guide and closure unit in position to open and close said passage.

3,371,494

METHOD AND MEANS OF ANCHORING AN OBJECT IN THE GROUND

Gunnar Lagerström, Ektorp, Sweden, assignor to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden

Filed Feb. 4, 1966, Ser. No. 525,068
12 Claims. (Cl. 61—39)



A method and apparatus which provides for the installation of tie anchoring and/or reinforcing rods in soil adjacent construction areas such as building foundations which includes utilizing a rotative and/or percussive power feed to drive a drill rod string carrying a rod anchor into the soil and capable of penetrating rock therein and a drill tube string enclosing the drill rod string and having an outer diameter less than the rod anchor; with the combined drill rod string and drill tube string providing means for injecting washing fluid to said anchor during drilling and means for injecting grouting into the drilled hole through the tube string and out the lower end thereof around the drill rod string and anchor while simultaneously withdrawing the tube string from the drilled hole.

3,371,495

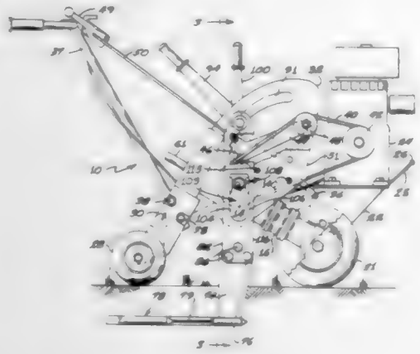
CONDUIT EMBEDDING MACHINE

William C. Kaercher, Jr., Minneapolis, Minn., assignor to Gamma, Inc., Minneapolis, Minn., a corporation of Minnesota

Filed Oct. 22, 1965, Ser. No. 501,103
18 Claims. (Cl. 61—72.7)

A pair of oscillatory arms are suspended from a shaft mounted on a wheeled chassis. An eccentric bearing assembly, one for each arm, is rotated between forwardly and rearwardly spaced cam blocks on the arms so as to impart oscillatory motion to said arms. A thin blade extends vertically downwardly from a transverse stress bar and has integrally affixed to its lower end a tunnel-form-

ing member. A flexible cable extends rearwardly from the tunnel-forming member and connects with the conduit to be embedded in the ground. The arms, together with the vertical blade and the tunnel-forming member, can



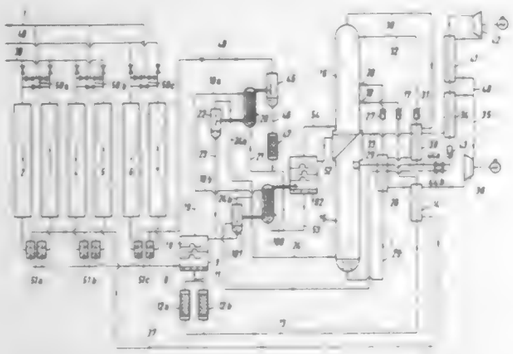
be raised by reason of the vertical movement made possible by the eccentric assembly and the spaced cam surfaces against which the eccentric assembly bears when imparting oscillatory motion to the arms.

3,371,496

WASH LIQUID PRODUCTION BY HEAT EXCHANGE WITH LOW PRESSURE LIQUID OXYGEN

Max Seidel, Munich-Solln, Germany, assignor to Linde Aktiengesellschaft, Wiesbaden, Germany

Filed July 27, 1964, Ser. No. 385,426
24 Claims. (Cl. 62—13)



1. A process for producing gas of 70–98% oxygen purity in a double rectifier having a high pressure column and a low pressure column, comprising the steps of:

(a) conducting compressed air to be fractionated through regenerators in indirect heat exchange with fractionation products;

(b) conducting cooled gaseous air to a prewashing column and washing the air with liquid air enriched in oxygen;

(c) withdrawing liquid preliminary product from the sump of the low pressure column to an intermediate partial vaporization zone and partially vaporizing said preliminary product into a first liquid fraction and a first vapor fraction;

(d) recycling said first vapor fraction to the bottom portion of the low pressure column;

(e) conducting said first liquid fraction to a final partial vaporization zone separate and distinct from said intermediate partial vaporization zone to partially vaporize said first liquid fraction to obtain a second liquid fraction and a second vapor fraction;

(f) conducting partial vaporization of at least one of steps (c) and (e) in indirect heat exchange with washed cold gaseous air from step (b) to partially condense same;

(g) recycling resultant liquid from partially condensed air as washing liquid to said prewashing column; and

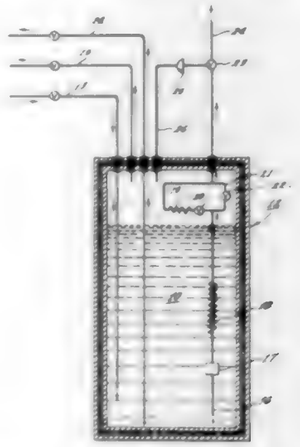
(h) conducting resultant loaded washing liquid to the low pressure column.

3,371,497

MAINTAINING CONSTANT COMPOSITION IN A VOLATILE MULTI-COMPONENT LIQUID

Alan H. Singleton, Emmaus, Pa., assignor to Air Products and Chemicals, Inc., Philadelphia, Pa., a corporation of Delaware

Filed Aug. 5, 1966, Ser. No. 570,626
5 Claims. (Cl. 62—45)



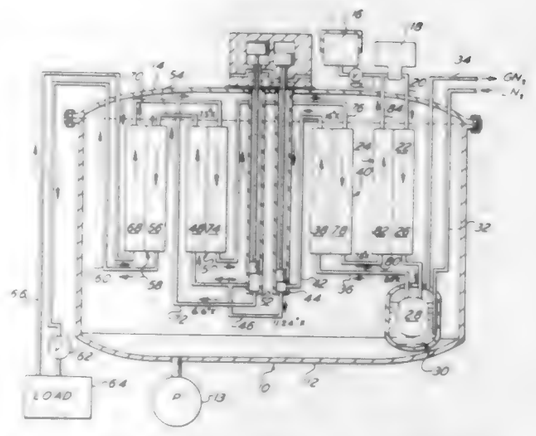
A method and system is described for maintaining a multi-component cryogenic liquid of constant composition during extended periods of storage in a vessel. The system includes a pressure-responsive relief valve through which an expanded and vaporized fraction of the stored liquid is vented thereby precluding preferential vaporization of the lower boiling point component due to unavoidable heat leak into the vessel.

3,371,498

CRYOGENIC REFRIGERATOR

Charles B. Hood, Jr., Columbus, Ohio, assignor to CVI Corporation, a corporation of Ohio

Filed Dec. 12, 1966, Ser. No. 601,070
4 Claims. (Cl. 62—45)



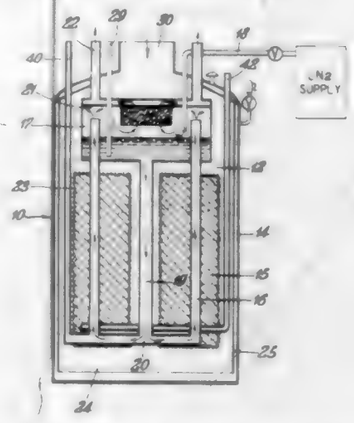
A cryogenic refrigerator capable of generating temperatures in the vicinity of the boiling point of liquid helium (4.2° K.) with efficient power input for a given load (4.7 B.t.u./lb. of helium flow). Cooling is attained by a combination of expansion and heat exchange. A pair of expansion devices is provided with all flow going through the first expansion device and less than half of the flow passing through the second expansion device.

3,371,499

CRYOSORPTION VACUUM PUMPING SYSTEM

Gerard F. Hagenbach, Tonawanda, N.Y., and Domingo Cheng, Los Altos, Calif., assignors to Union Carbide Corporation, a corporation of New York

Filed Nov. 2, 1966, Ser. No. 591,552
8 Claims. (Cl. 62—55.5)



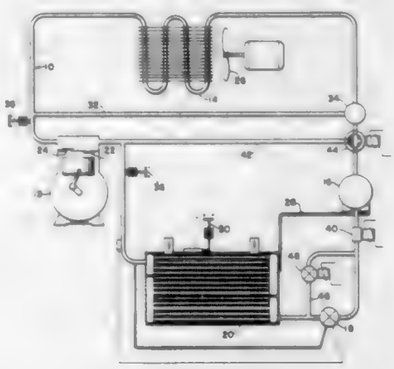
1. A cryosorption vacuum pumping system comprising the combination with a cryosorption vacuum pump including adsorbent material, means having extended heat transfer surfaces embedded therein, said pump also having a fluid refrigerant conduit in thermal contact with said extended surfaces, and a gas leak-tight casing therefor having a pumping port in communication with said adsorbent material; of a reservoir for liquid refrigerant located wholly within said casing, means for supplying liquid refrigerant through the wall of said casing to said reservoir, means providing communication for such refrigerant between the reservoir and said fluid conduit, and means for venting vapor from said conduit through said wall of the casing.

3,371,500

REFRIGERATION SYSTEM STARTING

Roy F. Marcus, Jr., Onalaska, Wis., assignor to The Trane Company, La Crosse, Wis., a corporation of Wisconsin

Filed May 13, 1966, Ser. No. 549,839
17 Claims. (Cl. 62—117)



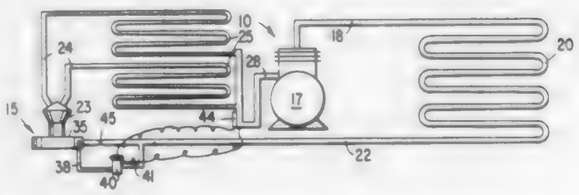
15. In a refrigeration system having a closed refrigerant circuit including a compressor means, condenser means, receiver means, throttling means, and evaporator means connected respectively in series and means for discontinuing operation of said compressor means in response to a predetermined minimum pressure in a portion of the refrigerant circuit, the method of starting said compressor means when the pressure in the condenser means is insufficient to raise the pressure in said portion of said refrigerant circuit to said predetermined minimum pressure including the steps of: interrupting fluid communication between said condenser means and receiver means; passing refrigerant gas from said evaporator means to said receiver means via a route bypassing said compressor means and condenser means; passing liquid refrigerant in said receiver means to said evaporator means by gravity flow; vaporizing said liquid refrigerant in said evaporator means for passage back to said receiver means and for raising the pressure in said portion of said circuit to said predetermined minimum pressure; activating said compressor means in response to said rise in pressure in said portion of said refrigerant circuit to said predetermined minimum pressure; and terminating said interrupting step.

3,371,501

REFRIGERANT SYSTEM EXPANSION MEANS

Hal H. Rhea, North Syracuse, and David S. Wilson, East Syracuse, N.Y., assignors to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware

Filed June 20, 1966, Ser. No. 558,710
8 Claims. (Cl. 62—160)



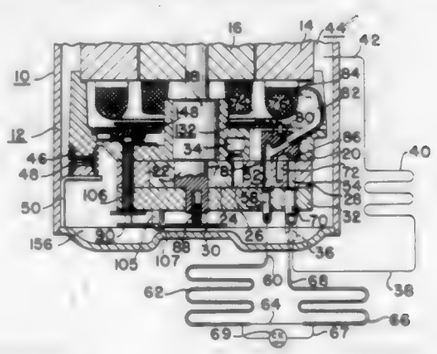
1. In a refrigeration system, the combination of compression means; a first heat exchanger for receiving refrigerant discharged by said compression means; refrigerant metering means connected with said first heat exchanger; and a second heat exchanger arranged between said refrigerant metering means and said compression means, said system being adapted upon actuation of said compression means to cool, said refrigerant metering means including a fluid regulator forming a vortex chamber through which refrigerant passes enroute to said second heat exchanger, said regulator having a control orifice in substantially tangential communication with said vortex chamber for introduction of vortex inducing pressurized control fluid into said regulator chamber, and control means for varying discharge of pressurized control fluid from said regulator orifice in response to system cooling load conditions to vary flow of refrigerant through said regulator to said second heat exchanger in accordance with changes in system cooling load.

3,371,502

REFRIGERANT COMPRESSOR WITH BUILT-IN REVERSE CYCLE VALVING

John H. Heidorn, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

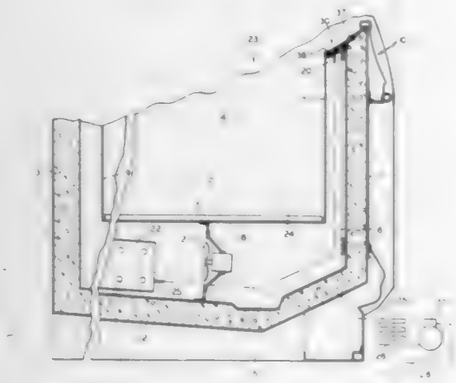
Filed Aug. 26, 1966, Ser. No. 575,409
5 Claims. (Cl. 62—234)



In the preferred form, a refrigerant system having a compressor, an evaporator coil, a condenser coil and means for connecting them in series refrigerant flow

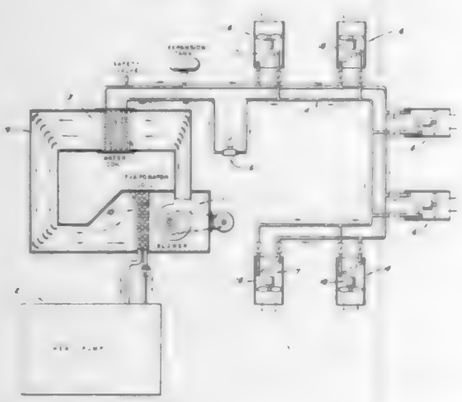
relationship, a two-way valve positioned by operating means driven off a compressor drive shaft ino first and second flow directing positions with respect to first and second director ports in the compressor body thereby to periodically reverse the flow of the refrigerant through the condenser and the evaporator.

3,371,503
REFRIGERANT LINE GRILLE STRUCTURE
Arthur Perez, Niles, Mich., assignor to Clark Equipment Company, a corporation of Michigan
Filed Nov. 23, 1966, Ser. No. 596,584
10 Claims. (Cl. 62—256)



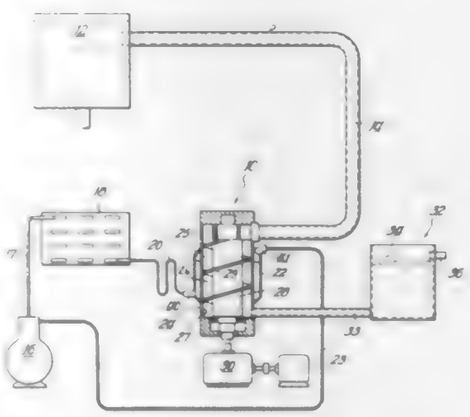
The invention provides a grille structure formed of a portion of a fluid refrigerant supply conduit across which a plurality of rods are secured. The grille is disposed at one side of an opening affording access to the interior of a refrigerated case, along a return aperture of duct means by which refrigerating air is circulated in the case and over the access opening to warm the air sufficiently by means of the warmer refrigerant to avoid frost deposits on the grille and adjacent portions of the case. The grille prevents entry of objects into the duct, yet is sufficiently open to avoid excessive warming of the air with resultant inefficiency due to the need to remove the excess heat. In addition, subcooling of the refrigerant flowing through the grille improves refrigeration efficiency.

3,371,504
HEAT EXCHANGER FOR AIR CONDITIONER
Claude S. Brindley, 254 Freddie Drive, Dallas, Tex. 75217
Filed Oct. 23, 1965, Ser. No. 503,361
1 Claim. (Cl. 62—324)



1. In an air heating and cooling system, in combination with a fluid circulation system having connection with a series of heating and cooling units, a duct system closed to outside air and having a blower fan operating therein to circulate air therethrough, an evaporation-condenser coil in said duct system in the path of air circulated therethrough by said fan, a heat transfer coil in said fluid circulation system enclosed in said duct system in the path of air circulated therethrough, a heat pump arranged externally of said duct system having connection with said evaporator-condenser coil whereby to heat or cool the air circulated through said heat transfer coil and whereby said circulated air is dehydrated.

3,371,505
AUGER ICEMAKER
Francis M. Raver, Yoe, and William F. Markley, York, Pa., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Mar. 2, 1964, Ser. No. 348,512
6 Claims. (Cl. 62—320)

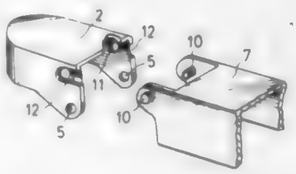


5. Icemaking apparatus comprising:
a casing having a freezing chamber including a generally cylindrical freezing wall and means defining a compacting surface extending in a plane substantially normal to the axis of said freezing chamber;
means defining an aperture in the upper portion of said casing to provide a discharge passage;
means for supplying water to said freezing chamber;
refrigeration means for cooling said freezing chamber to freeze a portion of the water supplied thereto on said freezing wall;
a rotatable auger disposed within said freezing chamber for scraping ice frozen on said freezing wall and forming a generally annularly shaped body of ice in the upper portion of said freezing chamber, said rotatable auger being effective to rotate said body of ice; and
shearing and guiding means in the upper portion of said chamber, said means including a straight, elongated blade element extending entirely across the path of the rotating body of ice, said blade element co-operating with a portion of said freezing wall to define a restricted path for the ice as it is guided through said aperture, said blade element being so spatially related to the freezing wall so as to form a compacted body of ice from which a uniform section is sheared by said blade element.

3,371,506
FRICTION WHEEL CIGARETTE LIGHTER
Hermann Zahn, Gutleutstrasse 131, Frankfurt am Main, Germany
Filed Oct. 1, 1965, Ser. No. 491,988
Claims priority, application Germany, Oct. 2, 1964, Z 11,103
1 Claim. (Cl. 67—7.1)

A hinge structure for a cigarette lighter having an extinguishing cap carrier with walls provided with stud-

receiving holes and guide grooves of decreasing depth for studs on flexible press lever walls. Easy assembly



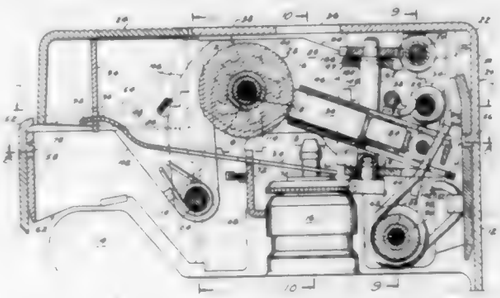
is effected by sliding the studs along the grooves into engagement with the holes.

3,371,507

CIGARETTE LIGHTER

Stanley H. Newman, % Regency Hotel, Park Ave. at 61st St., New York, N.Y. 10021

Filed Oct. 23, 1965, Ser. No. 503,848
Claims priority, application France, Nov. 19, 1964, 995,510
3 Claims. (Cl. 67—7.1)



A cigarette lighter which uses a compressible gas as a fuel, the lighter having a sparkwheel and flint assembly which is rotated by means of a ratchet wheel activated by a pawl member and an activating lever, the activating lever also opening the valve to emit fuel, the mechanism for maintaining a flint in contact with the sparkwheel also serves as a device for holding the head mechanism in engagement with the container.

3,371,508

MOCK CANDLE

Arthur J. Nelson, Santa Barbara, Calif.
(1998 Broadway St., San Francisco, Calif. 94109)

Filed Feb. 7, 1966, Ser. No. 525,764
9 Claims. (Cl. 67—27)

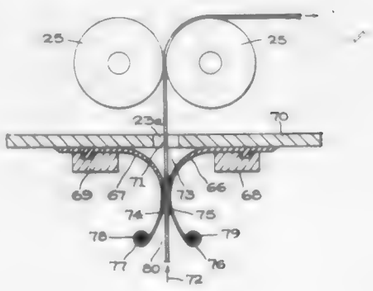
A candle concealed in a receptacle has either selective or automatic regulation of flame size to prolong its burning life, meanwhile an external indicator foretells the residual time of burning. The candle is spring-loaded to provide a required pressure at its upper taper-end to seal off gravitational waste of molten wax and has a candle lower-end vessel to eventually retain the candle mass when it changes from solid to a liquid pool for final consumption.

3,371,509

APPARATUS FOR THE FLUID TREATMENT OF WEB MATERIAL

Julien Dungler, Basel, Switzerland, assignor to Scholl AG., Zofingen, Switzerland, a joint-stock company of Switzerland

Filed July 27, 1965, Ser. No. 475,157
5 Claims. (Cl. 68—5)



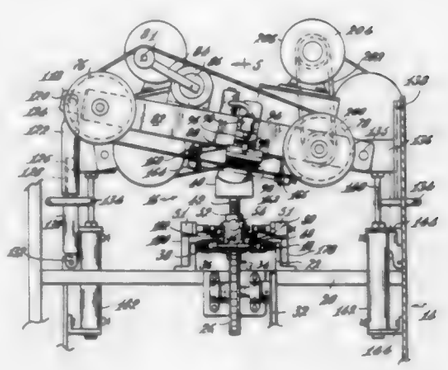
A sealing device allowing the advance of sheet material through an elongated opening in a wall and yet ensuring an air-tight separation of the spaces on either side of said wall; said sealing device comprises a pair of flat, flexible members which at one end are secured to said wall by rail means at either side of said opening and, at the other end, lie flat against opposed faces of said advanced sheet; said rail means include a transverse groove to receive a rib integral with said flexible members.

3,371,510

ROUGHING MACHINE

Robert B. Dunlap, Medway, Mass., assignor to Compo Shoe Machinery Corporation, Waltham, Mass., a corporation of Delaware

Filed June 3, 1966, Ser. No. 555,126
29 Claims. (Cl. 69—6.5)



1. A machine for roughening the bottoms of lasted uppers comprising means for supporting a lasted upper with its bottom in a predetermined plane and for movement along a predetermined path, a pair of flexible end-

less members, each having an outwardly directed working face and supported one at each side of the path of movement of the lasted upper in spaced parallel relation transversely of the path of movement of the lasted upper for movement relative to said path of movement, a yieldable backing member for each of said endless members mounted to back its respective member, each of said endless members being movable linearly on its support relative to said yieldable backing member located in a position to conform that portion of the endless member having engagement with the bottom at any given time to the contour of the portion of the bottom with which it has engagement, and power-operable means for maintaining said endless members in engagement with the marginal portions of the bottom at each side throughout movement of the bottom relative to said endless members.

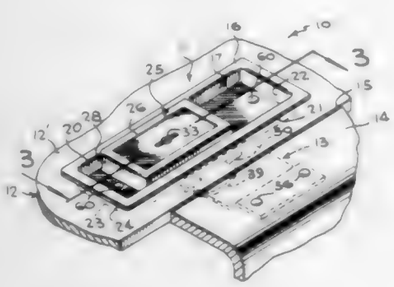
3,371,511

LATCH AND LOCK MECHANISM

Wallace E. Atkinson, Dinwiddie County, Va., assignor to Long Manufacturing Co., Inc., Petersburg, Va., a corporation of Virginia

Filed July 21, 1966, Ser. No. 566,848

9 Claims. (Cl. 70—71)



1. A combined latch and lock adapted to be mounted on first and second wall portions of separable parts of a container adjacent a line of separation therebetween for securing the parts together, comprising a keeper to be affixed to the first wall portion, said second wall portion having an opening therethrough bounded by interior and exterior surfaces of said second wall portion, a latching unit on said second wall portion including a cup member formed of an integral sheet metal stamping having marginal flanges disposed in a common plane to be mounted flush against said exterior surface and having side, end and base panel portions collectively defining an outwardly opening well extending inwardly through said opening in nested relation therein from said common plane and elongated along a major axis paralleling the plane of separation, said base panel portion generally paralleling said common plane and being spaced inwardly therefrom a distance corresponding to the thickness of said second wall portion disposing said base panel portion substantially flush with said interior surface, a movable latch member of narrower length than said well nested in said well, means slidably mounting said latch member in said well for rectilinear movement along the major axis of said well between a latching position and a release position displaced longitudinally from said latching position, and said latch member having catch means projecting into selected alignment with said keeper for interlocking engagement therewith when said latch member is in said latching position and said separable container parts are in closed condition and for releasing said keeper therefrom when said latch member is moved to said release position.

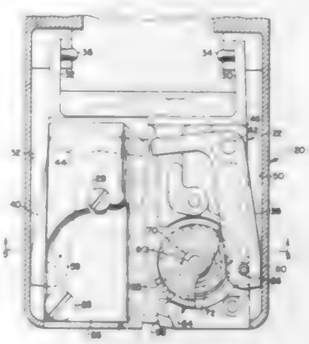
3,371,512

LOCKS

William C. Hutton and Davies Allport, Denton, Tex., and George A. Wood, Jr., Lincoln, Mass., assignors, by direct and mesne assignments, to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania

Filed May 7, 1965, Ser. No. 453,989

3 Claims. (Cl. 70—353)



A lock assembly which is locked and unlocked by purely linear movement of a key.

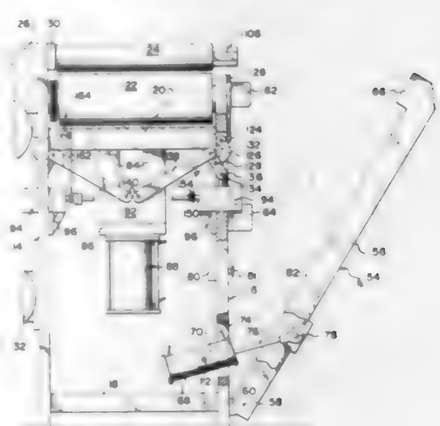
3,371,513

OPEN END ROLLING MACHINE

Howard S. Achler and Harold Kaufmann, Chicago, Ill., assignors to Kaufmann Tool & Engineering Corp., Chicago, Ill., a corporation of Illinois

Continuation-in-part of application Ser. No. 357,413, Apr. 6, 1964. This application Dec. 9, 1965, Ser. No. 512,710

21 Claims. (Cl. 72—166)



An elongated roller having anti-deflection character so as to avoid bowing when uniformly loaded is provided at relatively low cost by locating the support bearings, for a sleeve defining the pressure-receiving periphery of the roller, at precise distances from frame-supported ends of an elongated coaxial support shaft. Such an anti-deflection roller is useful in any machine where bowing is to be avoided. The portions of the pressure-receiving sleeve and/or support shaft between the bearings is of greater section modulus to inhibit bowing.

In a two-roller machine for rolling sheet metal where a first roller has a rigid periphery, means are provided for defining two relative positions for the rollers, the first position with the rollers forced together and the second position with the rollers spaced apart, and means are provided for sequentially moving one of the two rollers between the two positions. Continuously adjustable means are provided for selectively controlling the precise spacing between the centers of the rollers. The urethane rubber roller is arranged to be slid by force multiplying

means along track ways between the said two positions. One end of the rigid-periphery roller may be selectively freed sequentially from its support to afford removal of the sheet metal tube formed thereon. One or both of the rollers is preferably provided with anti-deflection character. Means are provided for accommodating flexing of the ends of the support shaft of the rigid-periphery roller. Rolling to different radii is accomplished by use of a tubular former positioned over the rigid-periphery roller.

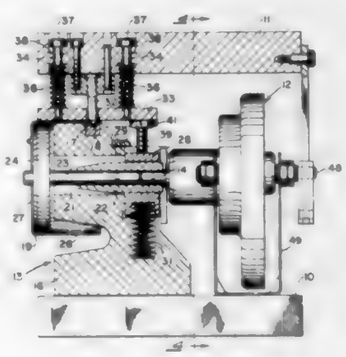
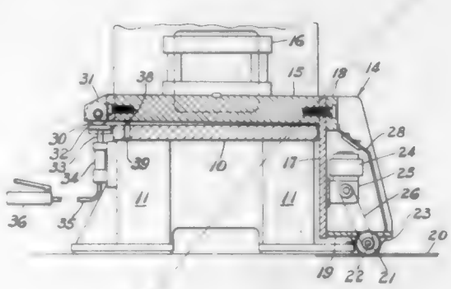
INDEXING APPARATUS
Herbert J. Venables III, Cleveland, Ohio, assignor to The Venables Machine & Tool Co., Cleveland, Ohio, a partnership
Filed Sept. 1, 1965, Ser. No. 484,382
12 Claims. (Cl. 72—421)



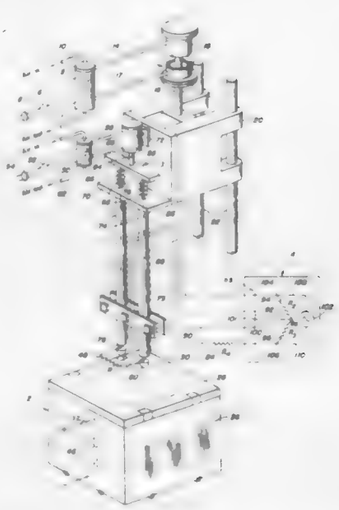
An indexing device for use with machine tools having a reciprocating tool carrier is arranged so that the tool carrier reciprocation provides indexing power. An indexing member adapted to index and support a workpiece is supported for limited movement in the direction of tool carrier movement so that the workpiece can move from a normal position into a work position and then be returned to its normal position clear of the tools before the indexing occurs. A cam mechanism is driven by the reciprocating tool carrier to cause the indexing operation only when the indexing member is in its normal position.

3,371,515
DIE LOADING APPARATUS FOR POWER PRESSES
Edwin A. Munschauer, Jr., Snyder, N.Y., assignor to Niagara Machine & Tool Works, Buffalo, N.Y.
Filed Feb. 7, 1966, Ser. No. 525,560
10 Claims. (Cl. 72—446)



1. Apparatus for moving die sets to and from working position on a power press bed disposed above the adjacent floor, said apparatus comprising a bolster for detachable securement to such press bed and adapted to have a die set secured thereon, support means at an edge of said bolster extending downwardly toward said floor, wheel means at the lower end of said support means to mount the same for rolling movement toward and away from said press bed, and other wheel means at the opposite edge of said bolster and projecting below the lower surface thereof for rolling movement on said press bed as said bolster moves to and from its working position on said press bed, means at the edge of said press bed opposite to said support means having surface portions substantially coplanar with said press bed whereby said other wheel means roll thereonto as the bolster reaches its working position on the press bed, said wheel means supporting said bolster during rolling movement with the lower surface of the bolster inclined upwardly with respect to the press bed in a direction toward said other wheel means, and means for selectively lowering said other wheel means to lower said bolster directly onto said press bed by pivotal movement thereof about the axis of said first mentioned wheel means and raising said last mentioned means to dispose said surface portions coplanar with said press bed for free rolling movement of said other wheel means on said surface portions and said press bed.

3,371,516
APPARATUS FOR ADJUSTING THE TEMPERATURE COEFFICIENT OF WIRE STRAIN GAGES
John D. Russell, Malibu, Calif., assignor to Microdot Inc., South Pasadena, Calif., a corporation of California
Original application June 15, 1960, Ser. No. 36,304, now Patent No. 3,245,016, dated Apr. 5, 1966. Divided and this application Sept. 15, 1965, Ser. No. 505,207
6 Claims. (Cl. 73—1)

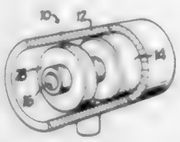


1. Apparatus for producing inherent temperature compensation within an unmounted strain gage composed of a strain responsive filament coupled through an electrical insulating material to a metallic support; said apparatus comprising means for establishing said strain gage at an elevated temperature; means for sensing and indicating the temperature sensitivity of said gage at said elevated temperature, said sensing and indicating means including first lead wires connecting said resistance filament to said indicating and sensing means, and a second lead wire of equal length and parallel to said first lead wires and connected at both ends to said indicating and sensing means, said second lead wire being adapted to cancel changes in resistivity of said first lead wires due to said elevated temperature, and heating means for shifting said temperature sensitivity with reference to its indicated value.

3,371,517
METHOD OF AND APPARATUS FOR PROXIMITY SENSING

Gabriel Roth, 6840 Roby, Union Lake, Mich. 48085

Filed Feb. 1, 1966, Ser. No. 524,020
2 Claims. (Cl. 73—37.5)

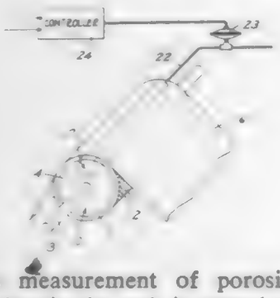


A sensing device for sensing the presence of an object at a given position by reflection of a gas stream directed against the object from a sensing head. The device includes an outlet passage and an inlet passage for reflected gas with the inlet passage being formed by an enlarged portion spaced from the outlet to reduce the turbulence of the gas flowing out of the sensing head.

3,371,518
DEVICE FOR CONTINUOUSLY MEASURING POROSITY

Marion A. Keyes, South Beloit, Ill., assignor to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin

Filed Feb. 12, 1965, Ser. No. 432,328
5 Claims. (Cl. 73—38)



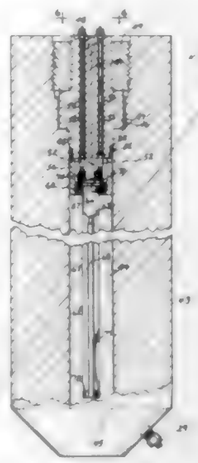
Continuous measurement of porosity of a moving porous web wherein the web is passed over an air chamber thereby subjecting it to a pressure differential, and sensing either the air flow through the web or changes in pressure in the chamber as an indication of variations in porosity, which changes can then be translated into a control signal for controlling process variables which affect the porosity.

3,371,519
POROSIMETER

Thomas J. Slone, Silver Spring, and Leonard J. Orbeck, Hyattsville, Md., assignors to American Instrument Co., Inc., Silver Spring, Md.

Filed Mar. 11, 1966, Ser. No. 533,560
10 Claims. (Cl. 73—38)

A porosimeter consisting of a pressure vessel with a penetrometer mounted therein and a controllable source of pressure fluid connected to the pressure vessel. The penetrometer has a stem provided with a conductive sleeve surrounding the stem. The penetrometer contains mercury, and the mercury in the stem and the sleeve form a condenser whose capacitance changes in accordance with changes in the height of the lower end of the mercury column in the stem. The penetrometer has a removable top cover disc provided with a central electrode exposed to the mercury in the interior of the penetrometer. The changes in height of the bottom of the mercury column are caused by penetration of the mercury into the pores of a sample contained in the penetrometer resulting from the pressure applied by the pressure fluid. The sleeve and electrode are electrically connected into a capacitance bridge so as to form one arm thereof. Changes in capacitance are measured on a meter connected to the output terminals of the bridge. These changes correspond to

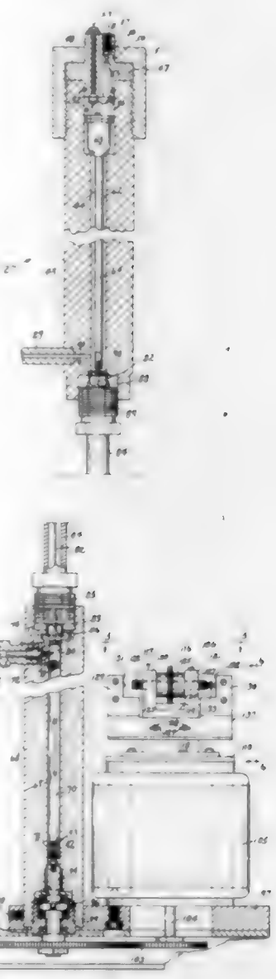


changes in the position of the lower end of the mercury column in the penetrometer stem.

3,371,520
ELECTRICAL POROSIMETER

Thomas J. Slone, Silver Spring, and Leonard J. Orbeck, Hyattsville, Md., assignors to American Instrument Co., Inc., Silver Spring, Md.

Filed Feb. 20, 1967, Ser. No. 617,216
10 Claims. (Cl. 73—38)



A porosimeter consisting of a pressure chamber in which is mounted a penetrometer having a depending stem. A source of pressure fluid is connected to the pres-

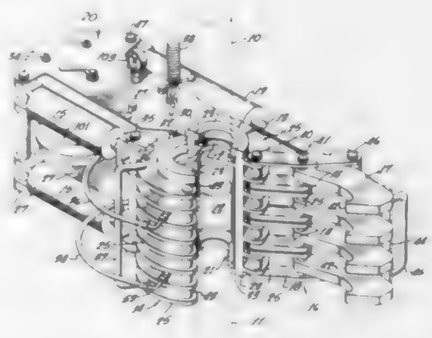
sure chamber and has an indicator to show the applied fluid pressure. The penetrometer contains mercury, which is forced up into the pores of sample material in the penetrometer under the applied fluid pressure. This causes the mercury to rise in the stem. A motor-driven probe rod is engaged in the stem through the bottom end thereof. The motor is energized through a Triac. A relay controls the application of gating potential to the gate electrode of the Triac. The relay is connected in the collector circuit of a normally conducting Darlington pair of transistors, normally maintaining the gating potential of the Triac by holding the relay energized. The probe is grounded and the input base electrode of the Darlington pair is connected to the mercury, so that the base electrode becomes grounded, turning off the Darlington pair, when the probe touches the bottom end of the mercury in the penetrometer stem. This deenergizes the relay, turning off the Triac and stopping the motor. The rotation of the motor shaft magnetically drives a reed switch which pulses a transistor amplifier whose output is connected to a pulse counter. The number of pulses counted from a zero starting position represents volumetric increments of pore penetration of the mercury into the sample material as the probe follows the upward movement of the bottom end of the mercury column in the penetrometer stem.

3,371,521

LEAK-TESTING APPARATUS FOR EITHER FLUSH OR SHOULDERED PIPE JOINTS AND PACKER THEREFOR

Ernest D. Hauk, 1315 E. 23rd St., Signal Hill, Calif. 90806

Filed Apr. 1, 1966, Ser. No. 539,579
31 Claims. (Cl. 73—46)



A high-pressure leak-testing apparatus for pipe joints, including joints wherein collars are present, comprising a split casing containing a rubber packer which is split correspondingly to the casing, both the casing and the packer being adapted to open up so as to receive a pipe joint in a direction lateral to the axis of the pipe. The packer contains mounting and compression means, and extrusion-prevention means, so constructed and located that the casing and packer when closed will contain fluids under pressures of thousands of pounds per square inch.

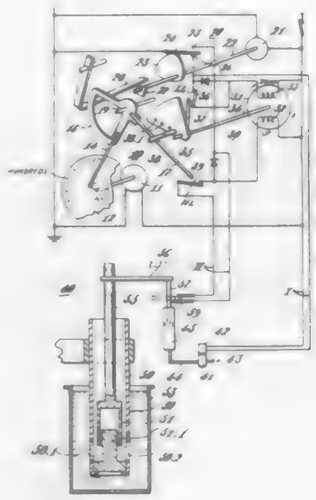
3,371,522

APPARATUS FOR MEASURING VISCOSITY

Austin S. Norcross, Newton, Mass., assignor to Norcross Corporation, Newton, Mass., a corporation of Massachusetts

Filed June 4, 1965, Ser. No. 461,280
7 Claims. (Cl. 73—57)

In a viscometer of the type wherein a cylinder and a piston form a gap and relative movement of cylinder and piston measures viscosity by the shearing of the fluid being tested, cylinder and piston are contained in a vessel for the fluid and the cylinder is moved over the fixed piston. The time needed by the cylinder to traverse a given stroke length is a measure of viscosity during



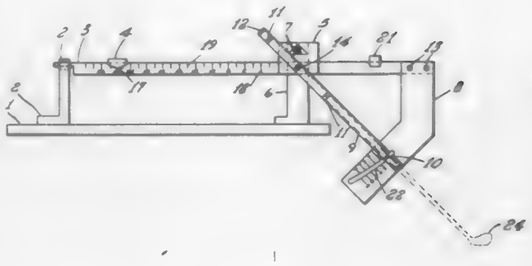
respective strokes. The viscometer is particularly useful for continuous measurement when cyclically actuated within fluid continuously or periodically changed in the vessel.

3,371,523

GOLF CLUB SWING WEIGHT BALANCE

James B. Crouch, 1959 Shirley Drive, and Harold E. Eagle, 2139 Woodland Ave., both of Burlington, N.C. 27215

Filed Sept. 20, 1965, Ser. No. 489,803
3 Claims. (Cl. 73—65)



This invention relates broadly to the field of sports and more specifically to a device for weighting various types of sports equipment, such as golf clubs or other implements which are wielded by hand when in use, to determine the feel exerted on the user at the instant the equipment is started in motion.

The present accepted standard for measuring and matching the swing weight of a set of golf clubs is a simple balance. Each club of a set of golf clubs is pivoted over a point fourteen inches from the shaft end and the head is weighted so that the same force on the shaft will balance each club in a horizontal position. The force applied to balance the club is changed as the desired swing weight changes. One familiar with the game of golf and skilled in the art of weight measuring devices realizes that such a balance is never achieved in the static or dynamic state when the instruments are properly swung. Therefore, the clubs of a set so balanced by the present method do not feel the same when they are

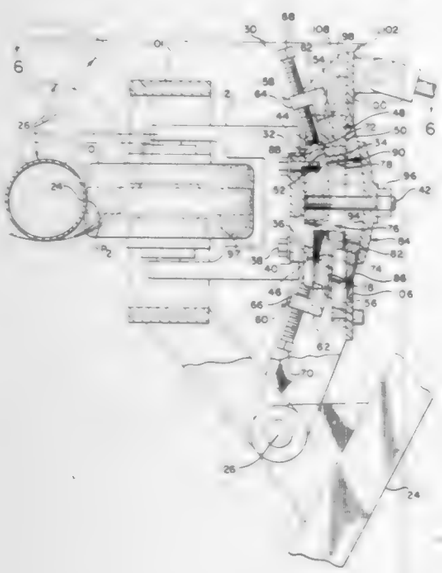
swung. The object of this invention is the provision of a golf club scale adaptable to measuring the feel exerted on the user by each club of a set, whereby, the normal grip and proper angle to the horizontal at the address position for each club of a set is employed. Whereas, to facilitate the modification of length and distribution of weight for each club of a set to such a degree as may be necessary to obtain the same balance for each club of a set to the requirements of the particular individual.

3,371,524

APPARATUS FOR POSITIONING A SEARCH UNIT

Joseph T. Wloszek, Seven Hills, Ohio (% Custom Machine, Inc., 9200 George Ave., Cleveland, Ohio 44105)

Filed Oct. 15, 1964, Ser. No. 404,128
5 Claims. (Cl. 73—67.8)



Apparatus for positioning a nondestructive ultrasonic search unit, such as a liquid filled, flexible wheel containing a sound transducer, with respect to a workpiece. Structure is provided for pivoting the wheel in two mutually perpendicular planes about a pivot point located substantially at the point of contact between the wheel and a workpiece. Structure is also provided for calibrating the search unit against a calibration piece, which is normally located in a retracted position remote from the search unit while the search unit is inspecting a workpiece.

3,371,525

CYLINDER FIRING PRESSURE APPARATUS

Robert W. Mitchell, Houston, Tex., assignor to Stewart & Stevenson Services, Inc., Houston, Tex., a corporation of Texas

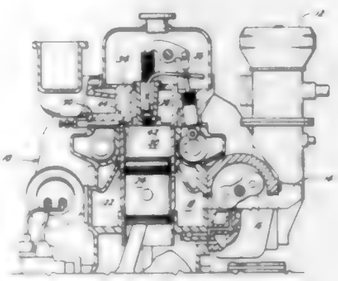
Filed Feb. 4, 1966, Ser. No. 525,225
5 Claims. (Cl. 73—115)

1. In combination with a diesel engine having a cylinder and head, the improvement of a cylinder firing pressure apparatus comprising,

a passageway in the cylinder head in communication with the cylinder and extending through said head,

an elongate tubular adapter body secured in said passageway and including an opening therethrough in communication with said passageway and cylinder, said body including pressure gauge releasable connecting means for receiving a pressure gauge for making firing pressure tests,

a stem adapted to extend through and substantially filling said opening for reducing the volume of the opening in communication with the cylinder when testing is completed and adapted to be removed from said opening when making pressure tests, and



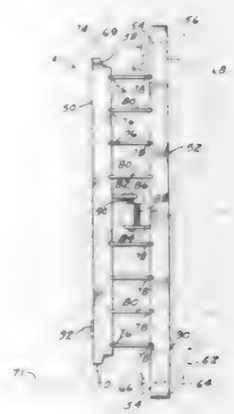
releasable connecting means between the stem and said body for releasably connecting the stem in said body opening.

3,371,526

LOAD CELL

George H. Fathauer, Decatur, Ill., assignor to Radson Engineering Corporation, Macon, Ill., a corporation of Illinois

Filed May 5, 1965, Ser. No. 453,393
9 Claims. (Cl. 73—141)



A load cell formed of a pair of walls in parallel relation, a pair of spring members extending between the walls, and a measuring device secured between the walls to sense parallel deflection of one wall with respect to the other wall without supporting any of the force causing the deflection. A bearing button and a bearing strip can be secured to respective walls to compensate for offset loads.

3,371,527

METHOD FOR IDENTIFYING WELL FLUIDS

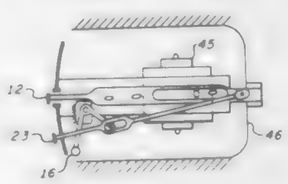
Jacques Fernand Moulin, 72 Rue Lauriston, Paris, France

Continuation of application Ser. No. 315,802, Oct. 14, 1963. This application Dec. 29, 1966, Ser. No. 605,938
Claims priority, application France, Oct. 23, 1962, 913,059
1 Claim. (Cl. 73—155)

The particular embodiment described herein as illustrative of one form of a method and apparatus for performing production logging operations in a well includes in situ measuring the percent of water, the density, and

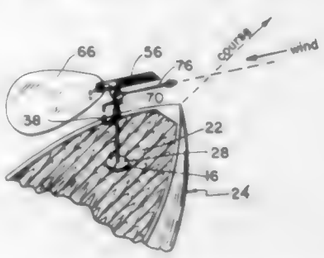
the rate of flow of the mixed producing fluids in the well. Simultaneous indications at the surface of these parameters are used to determine the specific relationship of each phase of the fluids in the mixture as it is produced.

3,371,528
TAKE-OFF DIRECTOR
Neil Sullivan, Sunbury-on-Thames, England, assignor, by mesne assignments, to Sperry Rand Limited, London, England, a company of England
Filed May 17, 1965, Ser. No. 456,223
Claims priority, application Great Britain, May 19, 1964, 20,559/64
2 Claims. (Cl. 73—178)



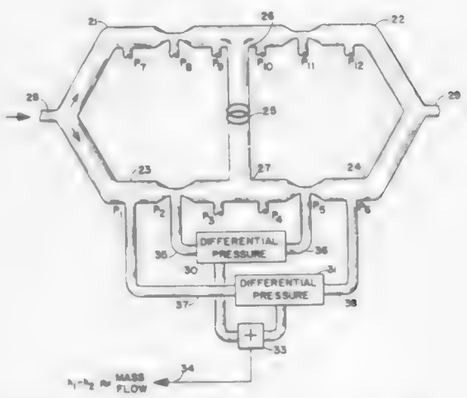
The longitudinal-axis acceleration of an aircraft existing at rotational velocity (V_R) is employed to command a pitch attitude proportional thereto whereby the longitudinal-axis acceleration then obtaining is converted into vertical lift resulting in a pitch attitude that is optimum for the climb-out velocity (V_2).

3,371,529
WIND INDICATOR SAILING AID
Richard L. Tillman, 174 St. Clair Ave., Elkhart, Ind. 46514
Filed Aug. 10, 1966, Ser. No. 571,620
8 Claims. (Cl. 73—188)



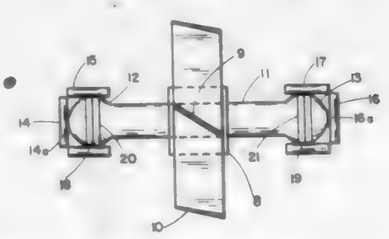
1. A relative wind direction sailing aid for a boat comprising a wind vane, means for mounting the wind vane means for pivotal movement about a predetermined axis on the boat, means for supporting a first indicator a predetermined distance from said axis in fixed relation with respect to the boat, a pair of spaced indicators, means carried by said wind vane means for supporting said spaced indicators at said predetermined distance from said axis for cooperation with said first indicator as the wind vane means turns with respect to the first indicator when located half way between spaced indicators when the center line of the boat and the wind driection coincide.

3,371,530
MASS FLOWMETER
Wilfred H. Howe, Sharon, Mass., assignor to The Foxboro Company, Foxboro, Mass., a corporation of Massachusetts
Filed Oct. 4, 1965, Ser. No. 492,610
10 Claims. (Cl. 73—205)



A mass flowmeter utilizing a constant volume pump in a bridge configuration in conjunction with at least two flow measuring devices in the bridge with at least one of said flow measuring devices being reversible in that the polarity of output remains the same under flow reversals, the combination performing at flow rates both above and below that of the constant volume pump.

3,371,531
TURBINE METER BEARING
Frederick D. Ezekiel, Lexington, and Joseph F. Bonarrigo, Pembroke, Mass., assignors to The Foxboro Company, Foxboro, Mass., a corporation of Massachusetts
Filed Oct. 22, 1965, Ser. No. 501,418
18 Claims. (Cl. 73—231)

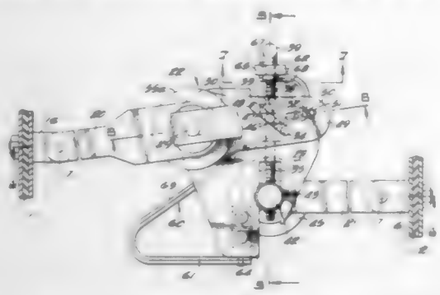


A turbine meter rotor shaft is supported at its end by tungsten carbide ball bearings fastened thereto, each ball bearing running in a cylindrically-shaped concavity in a bearing housing consisting of an aluminum oxide material.

3,371,532
TEMPERATURE-COMPENSATING CRANK ASSEMBLY FOR GAS METERS
Parker S. Anderson, Tempe, Ariz., assignor to Lancaster Meter Company, Tempe, Ariz., a corporation of Arizona
Filed Aug. 17, 1965, Ser. No. 480,399
3 Claims. (Cl. 73—281)

A diaphragm-actuated crank mechanism for a gas meter which mechanism includes a thermally-responsive bimetal

strip associated with the indexing screw of the crank mechanism and operable automatically to vary the throw



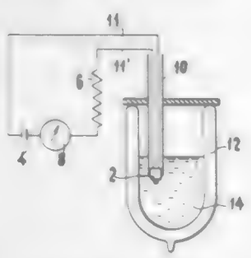
of the crank mechanism in response to variations in ambient temperatures.

3,371,533

APPARATUS FOR MEASURING THE LEVEL OF CRYOGENIC LIQUIDS

Guy H. Dumas, Paris, France, assignor to Société Industrielle de Liaisons Electriques, Paris, France, a company of France

Filed Feb. 15, 1965, Ser. No. 432,627
Claims priority, application France, Feb. 25, 1964, 964,990
2 Claims. (Cl. 73—295)



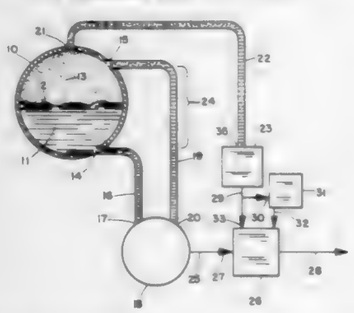
A method and apparatus for indicating a fall or rise in the level of a liquefied gas such as helium or hydrogen utilizing a thermo-sensitive semi-conductor body as the probe. The semi-conductor body is doped with impurities to produce a resistivity between about $\frac{1}{100}$ and some $\frac{1}{1000}$ of an ohm-centimeter at room temperature. The semi-conductor body is then immersed into the liquid and an electric current is passed through the semi-conductor by a constant voltage source to heat same to a temperature below the boiling point of the liquid. As the liquid level falls beneath the position of the semi-conductor body, a sharp increase in current is measured indicating the fall of the liquid, the increase in current being enhanced by a thermo-avalanche effect due to the characteristics of the semi-conductor body.

3,371,534

LEVEL SENSING APPARATUS

Lloyd T. Akeley, Sharon, Mass., assignor to The Foxboro Company, Foxboro, Mass., a corporation of Massachusetts

Filed May 10, 1966, Ser. No. 549,025
2 Claims. (Cl. 73—299)



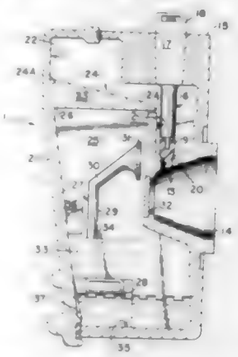
A tank level measuring system combines a static pressure measurement from the tank with a head level measurement in order to compute the level indication; the static pressure measurement is characterized to reduce the inherent error in such a system.

3,371,535

LIQUID LEVEL INDICATOR FOR DISPENSER IN DISHWASHER DOOR

Leonard J. Martiniak, Waukesha, Wis., assignor to General Electric Company, a corporation of New York

Filed Jan. 7, 1966, Ser. No. 519,219
5 Claims. (Cl. 73—306)



1. In a water-using appliance having a wash chamber and a door pivoted about a horizontal axis for movement between open and closed positions relative to said chamber, said door including dispenser means for dispensing liquid into said wash chamber at a desired time, said dispenser including:

(a) a container having a reservoir portion;

(b) a transparent window positioned within a wall of said container adjacent said reservoir portion for viewing into said reservoir when said door is in an open position;

(c) indicating means disposed within said reservoir for indicating the amount of liquid present therein;

(d) said indicating means comprising an elongated member having flag means at one end thereof and float means at the opposite end thereof, said indicating means thereby being adapted to float on the surface of liquid within said reservoir;

(e) said indicating means floating on the surface of liquid within said reservoir between a first position in which said reservoir is full and said flag means is not aligned with said window and is not viewable therethrough, through a series of intermediate positions in which the level of liquid within said reservoir decreases and said flag means begins to appear behind said window, and a final position wherein said indicating means rests on a wall of said container when said reservoir is empty, with said flag means being positioned directly behind said window and viewable from outside said container; and

(f) guide means disposed within said reservoir for retaining said indicating means and said flag means in substantially the same position relative to said window while said door is in either the open or closed position.

3,371,536

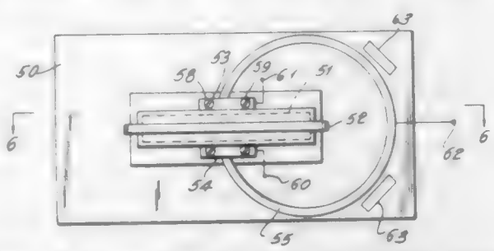
SONIC DISPLACEMENT TRANSDUCER

Jacob Tellerman, Bayside, N.Y., assignor to Kollsman Instrument Corporation, Elmhurst, N.Y., a corporation of New York

Filed July 20, 1966, Ser. No. 566,618
8 Claims. (Cl. 73—386)

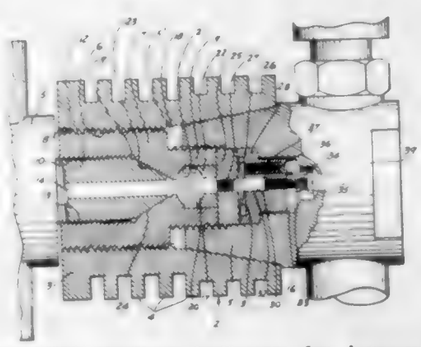
1. A displacement transducer comprising a self-supporting resilient curved rod having a first and second end; a first and second sonic reflecting mass connected to said

first and second ends, respectively; means for moving said first and second sonic reflecting masses with respect to one another to alter the curvature of said curved rod;



and means for measuring the speed of sound in said rod connected to said rod; the relative displacement between said first and second sonic reflecting masses being functionally related to the speed of sound in said rod.

3,371,537
PRESSURE INDICATOR
William J. Kiene, 6455 SW. 122nd St., Miami, Fla. 33156
Filed Sept. 16, 1965, Ser. No. 487,686
6 Claims. (Cl. 73—395)

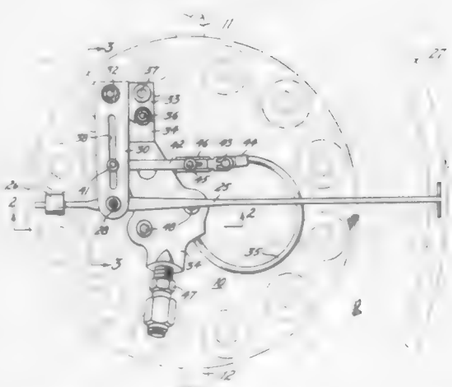


A maximum pressure indicator for internal combustion engines, etc. having a check valve for holding the maximum pressure applied. A filter is positioned in the passageway between the test engine and the gauge.

3,371,538
SAMPLER GAUGE
Orville W. Bagby, Rte. 2, Box 37, Pinson, Ala. 35126
Filed Apr. 1, 1966, Ser. No. 539,434
2 Claims. (Cl. 73—425.4)

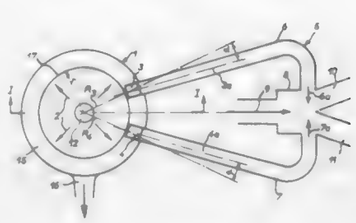
A liquid sampler gauge having an elongated vertical member and tube slidably connected for longitudinal movement relative to each other with the upper ends thereof terminating adjacent each other. A stopper carried by the elongated member closes the lower end of the tube upon relative movement in one direction and opens the lower end of the tube upon relative movement in the opposite direction.

3,371,539
COMPENSATING MECHANISM FOR INDICATOR
Robert D. Neyer, Oreland, Pa., assignor to Yarway Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed Dec. 27, 1965, Ser. No. 516,546
5 Claims. (Cl. 73—432)



1. In an indicator including a variable compensating means, a rotatable primary indicator shaft, a crank arm mounted on the primary shaft, an indicating pointer arm pivoting about an axis remote from the axis of the indicator shaft, a slidable pin in slot connection between said crank arm and the pointer arm, said slot being curved and having a radius of curvature equal to the radius of an arc traversed by displacement of the pointer arm pivot in response to the compensating means, whereby displacement of the pointer arm pivot varies the range of travel of the pointer arm relative to the range of travel of the primary indicator shaft.

3,371,540
FLUID GYROMETER
Don Pierre Louis Jean Colombani, Latresne, Adolphe Otton Gontier Ernst, Petit Piqnet, and Janos Rona, Bordeaux, France, assignors to Societe Nationale d'Etude et de Construction de Moteurs d'Aviation, Paris, France, a company of France
Filed Dec. 2, 1965, Ser. No. 511,109
Claims priority, application France, Dec. 4, 1964, 997,479
5 Claims. (Cl. 73—505)



1. A gyrometer for measuring angular velocity, comprising a conduit element having an axial inlet orifice and walls extending circumferentially of the axis of the inlet orifice; outlet means at the periphery of the conduit element, including two tubes fast with the said walls and inclined in opposite directions with respect to two respective radii of the conduit element; means for supplying fluid to the inlet orifice so as to create radial flow be-

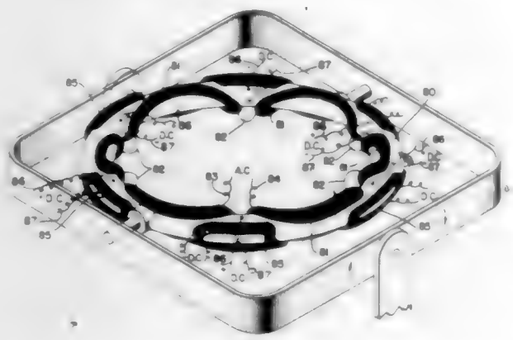
tween the walls, from the inlet orifice towards the peripheral outlet means; and means for measuring the difference between the rates of fluid-flow into the respective tubes, whereby measurement of the said differential flow-rate enables the angular velocity of the conduit element about the axis to be determined.

3,371,541

METHOD AND APPARATUS FOR MOVEMENT OF LIQUIDS BY ELECTROMAGNETIC MEANS

Harry H. Herman, Jr., Denver, Colo., assignor of fifteen percent to Louis Broido and Joseph A. Broido, both of New York, N.Y.

Filed Nov. 28, 1958, Ser. No. 776,884
12 Claims. (Cl. 74—5)



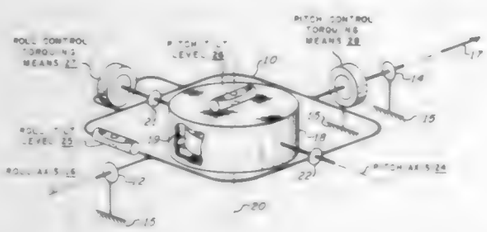
1. In a gyroscope, means defining a closed circuit path of substantially circular configuration for a body of electrically conductive fluid and rotary magnetic field developing means for electromagnetically inducing directional movement of said body of fluid within said path defining means constituting the inertia mass of the gyroscope.

3,371,542

GYRO VERTICAL ERECTING MEANS

Richard E. Swarts, Northport, and Bert V. Tiblin, Huntington, N.Y., assignors to Sperry Rand Corporation, Great Neck, N.Y., a corporation of New York

Filed Feb. 11, 1965, Ser. No. 431,811
12 Claims. (Cl. 74—5.47)



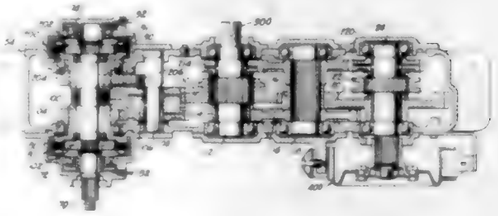
1. In a gyro vertical having a rotor frame mounted with freedom about mutually perpendicular, normally horizontal axes; means for controlling the erection of the frame including a torque motor with a control winding for one of the axes, a torque motor with a control winding for the other of the axes; a first level movable about one of the axes having an electrolytic conductor, a gravity responsive bubble, a pair of control electrodes wetted differentially by the conductor through a determined range of angular tilt, a continuously wetted electrode, and a normally non-wetted electrode wetted by the conductor and cooperating with the continuously wetted electrode to bypass the control electrodes at a determined angle of tilt of the first level greater than that of the operating range of the control electrodes; a second level movable about the other of the axes having an electrolytic conductor, a gravity responsive bubble, a pair of control electrodes wetted differentially by the conductor through a determined range of angular tilt, a continuously wetted electrode, and a normally non-wetted electrode wetted by the conductor and cooperating with the continuously wetted electrode to bypass the control electrodes at a determined angle of tilt of the second level greater than that of the operating range of the control electrodes; a source of electrical energy, and a circuit connecting the first and second levels in parallel relation to the source including a lead between the source and the respective continuously wetted electrodes of both levels, a lead connecting the normally non-wetted electrodes of both levels and the windings of both motors to the source, a lead between the related motor winding and one of the control electrodes of the first level, a lead between the related motor winding and the other of the control electrodes of the first level, a lead between the related motor winding and one of the control electrodes of the second level, and a lead between the related motor winding and the other of the control electrodes of the second level.

3,371,543

ENGINE POWER TAKEOFF DRIVE

Robert E. Jackson, 1210 Sussex Lane, and Evan S. Prichard, 1212 Essex Lane, both of Newport Beach, Calif. 92660

Continuation-in-part of application Ser. No. 391,712, Aug. 24, 1964. This application Oct. 21, 1966, Ser. No. 596,372
14 Claims. (Cl. 74—15.4)



A power takeoff transfer-transmission for mounting on the front of a vehicle and being driven from the front of the vehicle engine, where an internal gear train serves both to accomplish multiple speed changes and to displace the drive axis laterally from in front of the engine to a rearwardly extending drive shaft along one side of the vehicle. The apparatus includes pneumatically operated clutches and gear shifting means for remote engagement and control of the direction and speed of the power output drive to the laterally positioned drive shaft.

3,371,544

APPARATUS AND METHOD FOR PERFORATING BEVERAGE CASES OR THE LIKE

Arthur H. McElroy, 2789 E. 45th Place, Tulsa, Okla. 74105

Filed Nov. 23, 1964, Ser. No. 413,241
1 Claim. (Cl. 74—86)

1. Apparatus for selectively causing a desired orbital movement of a plate comprising

a support base;

a plurality of eccentric members rotatably supported to said base, each of said eccentrics including:

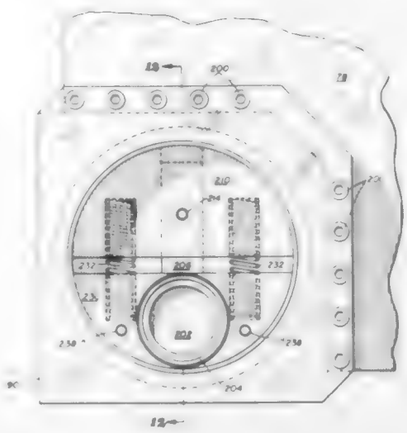
(1) an eccentric sleeve rotatably supported on said base,

(2) a first cam shoe attachable and rotatable with said eccentric sleeve,

(3) a second cam shoe radially movable relative to said eccentric sleeve, rotatably with said first cam shoe and spaced therefrom, and

(4) spring means normally biasing said second cam shoe radially outward from said first cam shoe;

said plate supported by said eccentrics for relative movement therewith;



at least one tracing cam removably attached to said support base and having an opening therein representative of said desired path;

a follower attached to said orbital plate juxtapositioned in said tracing cam opening; and

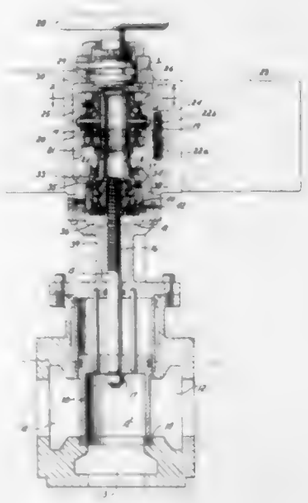
means to simultaneously rotate said eccentric members.

3,371,545

VALVE OPERATING EQUIPMENT

Daniel R. McNeal, Jr., Lansdale, and Lorenzo Boscaino, Norristown, Pa., assignors to Andale Company, Lansdale, Pa., a corporation of Pennsylvania

Filed Aug. 10, 1966, Ser. No. 571,464
7 Claims. (Cl. 74—89.15)



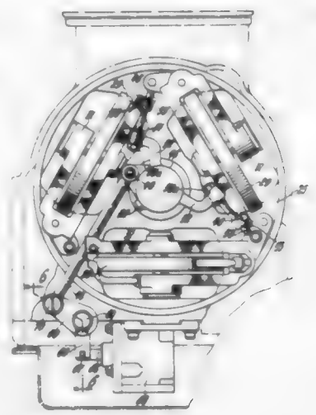
1. Valve operating equipment comprising cooperating sphere and socket members one of which is adapted to be associated with a valve stem for operation of the valve and the other of which is adapted to be rotatively driven by a valve operating device, the socket member having a plurality of internal arcuate grooves separated circumferentially of the socket by spaced abutments, the sphere member having circumferentially spaced recesses, and balls received partially in said recesses and partially in said grooves and serving as driving elements in cooperation with said abutments.

3,371,546

TORIC FRICTION TRANSMISSION WITH CROSS PIN RATIO CHANGING CONTROL

Elson B. Spangler, Bloomfield Hills, and Milton H. Scheiter, Birmingham, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed May 9, 1966, Ser. No. 548,510
9 Claims. (Cl. 74—200)



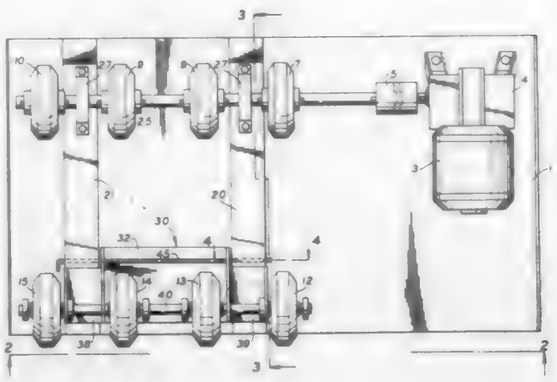
1. In a toroidal transmission having spaced toroidal discs with a roller for transmitting torque between said discs, a roller carrier, means rotatably supporting said roller in said carrier, means adjacent one end of said carrier forming a swivel joint support for said carrier, a carrier pin extending outwardly from said carrier, a rotatable control collar, a control pin extending outwardly from said control collar, means connecting said control pin to said carrier pin, and means for rotating said control collar to change the transmission drive ratio.

3,371,547

DRUM ROLLER

John S. Eckert, Silver Lake, and Glenn J. Haught, Cuyahoga Falls, Ohio, assignors, by mesne assignments, to U.S. Stoneware, Inc., a corporation of Massachusetts

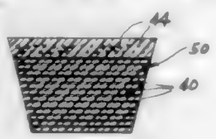
Filed Sept. 13, 1965, Ser. No. 486,684
6 Claims. (Cl. 74—206)



A drum roller is supported on each side by a series of rotatable wheels, the different series being parallel to one another. One or more wheels on one side of the drum are driven and those on the other side of the drum are idlers. The idlers are supported on a carriage which is movable toward and away from the driven wheels, and the carriage is capable of being fastened at different dis-

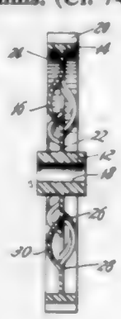
tances therefrom so as to accommodate drums of different sizes. The preferred fastening means includes a pin that passes through openings in the carriage and through openings selected from a series thereof in cross rails which support the driven wheel or wheels.

3,371,548
BELTS AND OTHER GLASS FIBER-ELASTOMERIC STRUCTURES AND METHOD OF MANUFACTURE
Alfred Marzocchi, Cumberland, R.I., assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Original application Dec. 26, 1962, Ser. No. 247,244, now Patent No. 3,296,050, dated Jan. 3, 1967. Divided and this application July 14, 1966, Ser. No. 582,770
3 Claims. (Cl. 74—234)



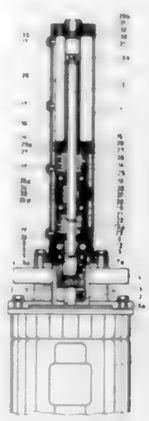
1. A drive belt comprising the combination of a cured elastomeric material and a plurality of adjacent rows of glass fiber bundles each of which is formed of a plurality of glass fibers characterized by high strength and dimensional stability under the temperature and pressure conditions of use and wherein a strong tie-in exists between the fibers and the cured elastomeric material, said fibers being confined within the elastomeric material and arranged therein to extend substantially unidirectionally crosswise of the belt and in which the bundles of glass fibers are concentrated in the inner radial portion of the belt.

3,371,549
RESILIENT ROTARY DRIVING ELEMENTS AND SYSTEM THEREOF
Ernst Schrempp, Norwalk, Conn., assignor to Pitney-Bowes, Inc., Stamford, Conn., a corporation of Delaware
Filed Sept. 8, 1966, Ser. No. 577,851
9 Claims. (Cl. 74—411)



1. A rotary motion transmitting element comprising
(A) a hub adapted to be mounted on a shaft;
(B) a rim having spaced circumferential teeth thereon, and
(C) a plurality of radially extending elongate ribs interconnecting said hub and said rim, said ribs being bowed to have an axial length slightly greater than the radial distance between said hub and said rim,
(D) said rotary element being formed entirely of a single homogeneous mass of thermoplastic material as an integral one-piece born to shape molding whereby said ribs may deform to permit said rim to become eccentric relative to said hub upon the application of an external radial force to said rim.

3,371,550
TRANSMISSIONS FOR CONVERTING ROTARY INTO LINEAR MOTION
Richard Haller, Brauerstrasse 51, Zurich, Switzerland
Filed Dec. 17, 1965, Ser. No. 514,510
Claims priority, application Switzerland, Dec. 18, 1964, 16,391/64
8 Claims. (Cl. 74—424.8)

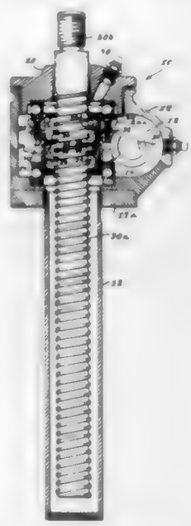


A drive incorporating an overrunning device for converting rotary motion into linear motion, wherein power is transmitted between a nut screwing along a threaded spindle or lead screw driven by the driving member and a non-rotatable axially displaceable tubular piston coaxially embracing the nut and connected with the driven member, through the medium of a locking spring, the ends of which, by means of a longitudinally slotted bush fixed in the tubular piston, are so influenced that for the transmission of power the locking spring bears tightly upon the nut and prevents it from rotating with the lead screw, whereas in the overrunning position the spring is relaxed to release the nut, so that it can rotate with the lead screw. The nut is held in a mid position in the tubular piston between two compression springs, and, when the piston is locked, is axially displaced in the latter. The locking ring, which is mounted upon the not on the lead screw, is located between two entraining rings loosely embracing the nut, these entraining rings being each held between two expanding split spreader rings, each inserted in an annular grove in the nut. Each entraining ring as at least one projection, which engages in a recess in the adjacent end face of the locking spring, and also has a projection extending radially outwards, upon which latter projection a control member located in the longitudinal slot of the bush and embracing the nut together with the locking spring, is provided with recesses for slidably guiding the said projections in an axial direction.

3,371,551
NUT AND SCREW MECHANISM
Anthony G. Profet, Charlotte, N.C., assignor to Duff-Norton Company, Charlotte, N.C., a corporation of North Carolina
Filed Sept. 1, 1966, Ser. No. 576,695
11 Claims. (Cl. 74—424.8)

8. A ball screw jack mechanism comprising a housing, an annular drive member seated in said housing for rotation therein, means for driving said annular drive member, a nut member seated in said annular drive member for rotation therewith, said nut member having a helically threaded interior surface, a screw member extending through said housing and nut member and having a helically threaded exterior surface mating with said nut member threaded surface, a plurality of ball bearing elements disposed for circulation in the threads of said mating

surfaces for drivingly connecting the screw member to said nut member, said nut member having a plurality of longitudinally extending, thread interrupting, recesses formed in said threaded surface thereof, said recesses being longitudinally coextensive for interruption of a plurality of common revolutions of the threads of the nut



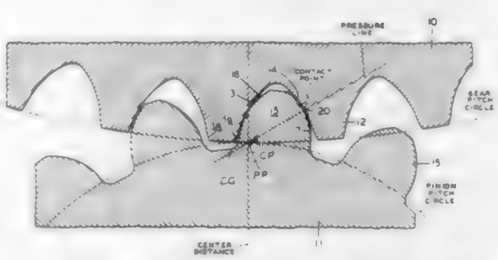
member surface, and an insert member seated in each of said plurality of recesses and having a plurality of return grooves formed thereacross with each groove connecting adjacent interruptions of said thread revolutions to form a return path for said ball bearing elements across the thread crest of said screw member surface for closed circuit recirculation of said ball bearing elements.

3,371,552

ROLLING CONTACT GEAR

Guy E. Soper, Williamsport, Md., assignor to Mack Trucks, Inc., Montvale, N.J., a corporation of New York

Filed Aug. 30, 1965, Ser. No. 483,547
4 Claims. (Cl. 74—462)



Rolling contact helical gears are provided which are insensitive to normal manufacturing errors and to changes in the center distances between the gears arising from variation of the load on the gears and are characterized by gear teeth having tooth profiles formed as circular arcs, the centers of which are located on the line passing through the pitch point and contact point of the gear teeth and in which the spacing of the centers of the tooth profile arcs from the pitch point are in proportion to the number of teeth on the gears.

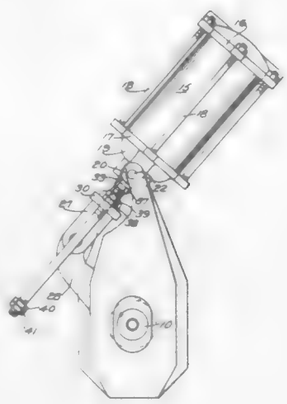
3,371,553

STOP FOR VALVE OPERATOR

Irving O. Miner, Warwick, R.I., assignor to The New York Air Brake Company, a corporation of New Jersey

Filed June 15, 1966, Ser. No. 557,754
5 Claims. (Cl. 74—526)

A power operated piston has a yoke mounted on the piston rod and a pair of guide rods received into the cylinder head. The yoke slidably reciprocates along the guide rods. A link pivotally attached to the yoke and



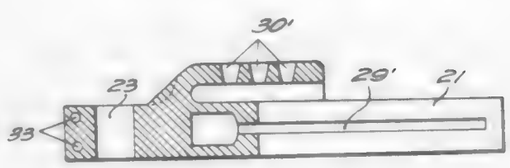
an arm rotatably operates a valve shaft. Stop means are provided on the guide rods to limit movement of the valve shaft.

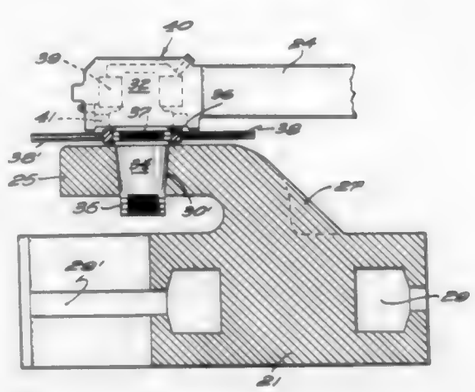
3,371,554

INTEGRAL CRANK AND PHASED COUNTERWEIGHT ARM

Harold E. McCray and Rue S. Hestand, Pampa, Tex., assignors to Cabot Corporation, Boston, Mass., a corporation of Delaware

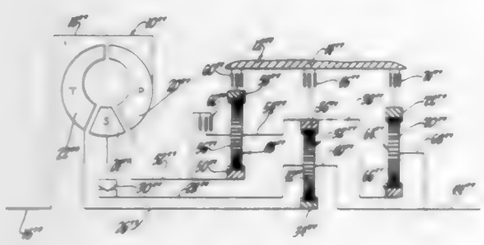
Filed Oct. 18, 1965, Ser. No. 497,084
4 Claims. (Cl. 74—600)





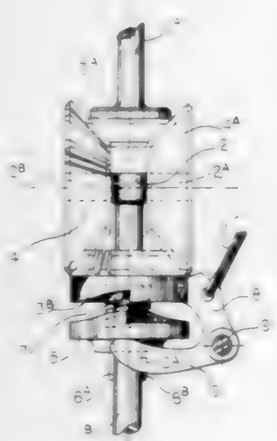
1. An integral crank and counterweight arm comprising a main elongated body portion having a crank shaft fitting near one end and a groove in either longitudinal edge for mounting counterweights thereon in slidably adjustable positions therealong and, rigidly joined to and firmly rooted in one side face of said main body portion near the crankshaft end thereof, a raised, rigid, skirt-like projection which rises from its firmly rooted connection with said body portion and translates into a major flat section which is spaced apart from said body portion and has fittings therein for attaching wrist pin assemblies thereto at a substantial acute angular crank position relative to the effective torque arm of said counterweights.

3,371,555
TRANSMISSION
Robert M. Tuck and Kenneth B. Harmon, Indianapolis, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 27, 1965, Ser. No. 490,181
3 Claims. (Cl. 74—677)



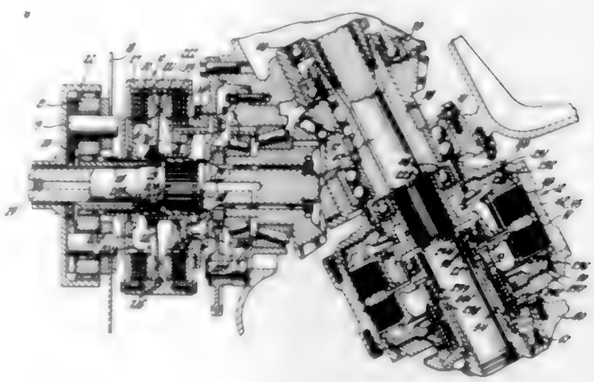
A transmission having a torque converter combined with a multiratio gear unit to provide torque converter and reduction gear ratio series drive in the lowest drive range and split torque drive in the higher drive ranges. The converter's stator is connected by a one-way clutch to the transmission output so that during converter operation in all of the forward drive ranges the stator reaction is directly substracted from the output and the stator is permitted to run faster than the transmission output for increased efficiency in the coupling stage. The stator connection also provides for input power to be fed from the gear unit back to the torque converter for increased converter performance in the higher drive ranges.

3,371,556
TRANSMISSION MECHANISM
Normand Duchesne, 335 Tessier St., La Tuque, Quebec, Canada
Continuation-in-part of application Ser. No. 402,502, Oct. 8, 1964. This application Dec. 6, 1966, Ser. No. 599,464
7 Claims. (Cl. 74—777)



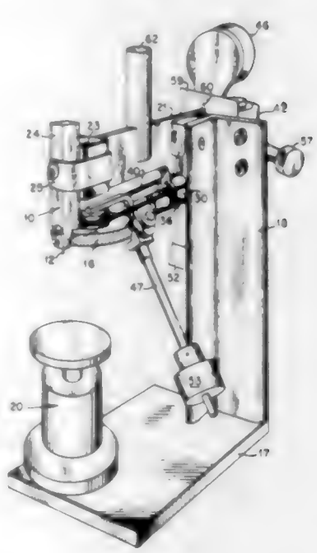
A transmission mechanism comprising two pairs of gears mounted to rotate on mutually transverse interconnected shafts with both gears of one pair of gears meshing with both gears of the other pair of gears, a second shaft coaxial with one of said mutually transverse shafts, and a clutch to selectively prevent rotation of one gear on one of said coaxial shafts and the other gear being fixed to one of said coaxial shafts and means to selectively connect said one gear to one of said coaxial shafts for rotation therewith thereby to vary the output of the transmission.

3,371,557
TRANSMISSION
Charles R. Lammert, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 13, 1965, Ser. No. 495,499
15 Claims. (Cl. 74—781)



A rotatable bearing support for a friction drive establishing device is herein disclosed in which the support is centrally located within a rotary housing so that the bearing load is substantially radial. Either the rotary housing or hub member enclosed within the housing can be supported by the rotatable bearing support.

3,371,558
ROTARY DRILLING DEVICE
Charles Asmanes, Oak Ridge, Tenn., assignor to the United States of America as represented by the United States Atomic Energy Commission
Filed Feb. 15, 1966, Ser. No. 529,179
10 Claims. (Cl. 77—29)



1. A high-speed rotary drilling device of the character described, comprising a housing, bearing means carried by said housing for supporting a drill bit having an axis of rotation, rotatable means having a plane of rotation disposed generally perpendicular to said axis and spaced from said bearing means, said rotatable means being engageable with said drill bit when the latter is in said bearing means for maintaining said drill bit in an abutting relationship with said bearing means and for imparting a rotational force to said drill bit to effect rotation of the

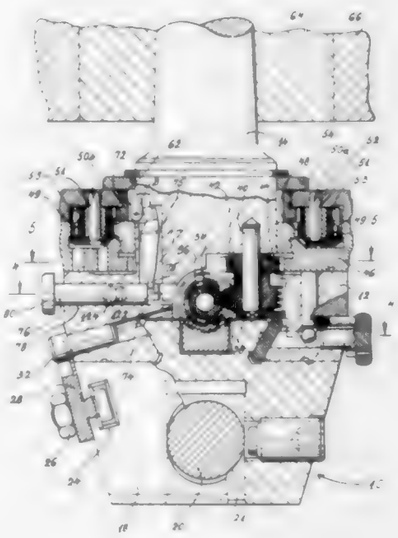
latter about said axis, and means coupled to said rotatable means for selectively positioning the plane of rotation of the rotatable means for redirecting a portion of the rotational force from a plane normal to said axis toward a plane parallel with said axis to effect relative movement of said drill bit with respect to said bearing means in a direction parallel to said axis.

3,371,559

MEANS FOR AUTOMATIC TOOL FEED AND RETRACTION CONTROL OF BORING AND FACING HEADS

Jule A. Scholl, 41—31 51st St., Woodside, N.Y., 11377

Filed July 15, 1966, Ser. No. 565,422
9 Claims. (Cl. 77—58)



1. A clutch control device for a clutch mechanism in a boring and facing head having a body rotatable on an axis, a tool supporting carriage mounted on said body and movable thereon in a straight path transversely of said axis, a stationary member slidingly engaged with said body while the body rotates, and a gear train operatively interconnecting said stationary member and carriage to drive the same transversely of said body, said clutch mechanism being interposed between said gear train and stationary member; said device comprising clutch means yieldably holding said gear train in operative engagement with stationary member so that the clutch means yields when said carriage encounters an obstruction to lateral movement on said body while the body continues to rotate in one direction, and so that the clutch means automatically operatively reengages said gear train and stationary member when the body is rotated in an opposite direction while the carriage moves away from said obstruction.

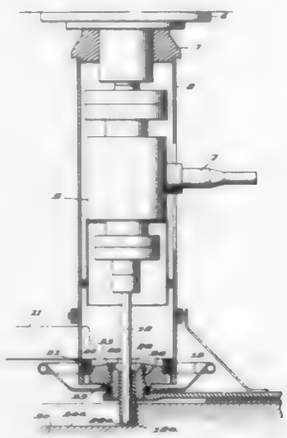
3,371,560

DEVICE FOR ACCURATE GUIDING OF DRILLING TOOLS IN DRILLING MACHINES

Alfred Käser, Rieden, near Baden, Aargau, Switzerland, assignor to Aktiengesellschaft Brown, Boveri & Cie, Baden, Switzerland, a joint-stock company

Filed Sept. 23, 1965, Ser. No. 489,628
Claims priority, application Switzerland, Oct. 23, 1964, 13,780/64
4 Claims. (Cl. 77—62)

A device for accurate guiding drilling tools in drilling machines comprises a guide bushing surrounding the drill shaft adjacent the surface of the workpiece to be drilled. The lower end of the guide bushing terminates in an



edge and this edge is forced downwardly into a penetrating contact with the surface of the workpiece as a downward force is applied to the bushing.

3,371,561

SAFETY PIN-APPLYING TOOLS

Norman A. Fabricant, 290 Birch St., Emerson, N.J. 07630

Filed Dec. 30, 1966, Ser. No. 606,171
9 Claims. (Cl. 81—3)

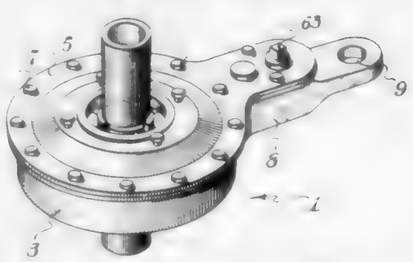
A safety or diaper pin insertion device, shaped like a thimble or ring and worn on a finger. It contains a projection which fits inside the coil of the pin, and other projections which orient the legs of the pin. The pin is thus held under explicit control during insertion and the finger is protected from the painful pressure normally required to push the pin through several layers of diapers.

3,371,562

GRAPPLE

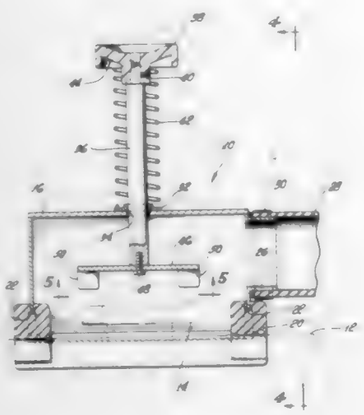
Benjamin F. Kelley, 2711 E. 13th Place, Tulsa, Okla. 74104

Filed Oct. 23, 1965, Ser. No. 503,712
2 Claims. (Cl. 81—54)



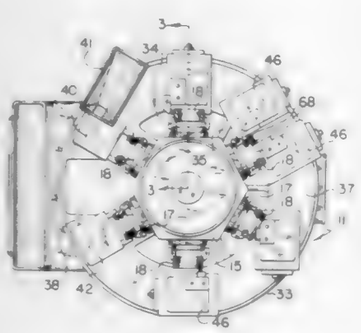
A grapple comprises a plurality of radially reciprocable jaws spring-urged outwardly, and movable inwardly by the rotation of a ring that has cam surfaces that bear against the radially outer ends of the jaws. A special brake and a special bumper are provided, as well as a special configuration of the jaw mountings.

3,371,563
SAFETY RADIATOR CAP REMOVAL TOOL
Matthew J. Lallo, 1041 Windsor Drive,
Thousand Oaks, Calif. 91360
Filed Aug. 11, 1966, Ser. No. 571,800
4 Claims. (Cl. 81—90)



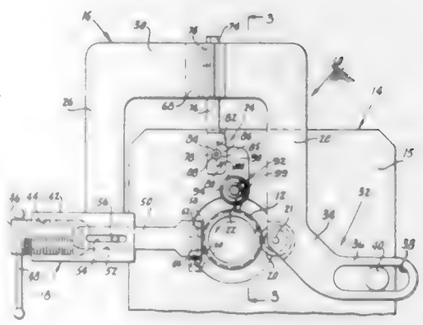
A removal tool for safely removing a radiator cap comprising steam retaining chamber which is positionable over a radiator cap and a radiator. A shaft is slideably and rotatably received in the retainer and has a device interior of the chamber for gripping the cap at one end and a handle exterior of the chamber at the other end. A spring is positioned about the shaft between the handle and the steam retaining chamber so that, when the shaft is depressed and the gripping device engages the cap, the spring will exert a force on the retainer which force is greater than any steam pressure which may emanate from the radiator.

3,371,564
STAR AUTOMATIC MACHINE
Karl P. Schubert, Cleveland Heights, John L. Molner, Cleveland, Ohio, assignors to The National Acme Company, a corporation of Ohio
Filed Oct. 4, 1965, Ser. No. 492,807
15 Claims. (Cl. 82—3)



The disclosure relates to a machine tool which has a turret carrying workholding spindles rotatable on horizontal axes extending radially from the vertical turret axis. The turret is indexable into positions equal to the number of spindles. A ring shaped table surrounds the turret and tool holder slide units are mounted on bases on the table. One or more of these slide units may cooperate at each spindle position and the slide units are driven by a cam which permits the slide units to be disposed at any angle in a horizontal plane for making facing, angular or lengthwise cuts on the workpieces in the turret spindles.

3,371,565
PIPE CUTTING AND BEVELING DEVICE
Johnny W. Mayfield, 617 Main Ave.,
Sacramento, Calif. 95838
Filed Feb. 2, 1966, Ser. No. 514,446
8 Claims. (Cl. 82—4)

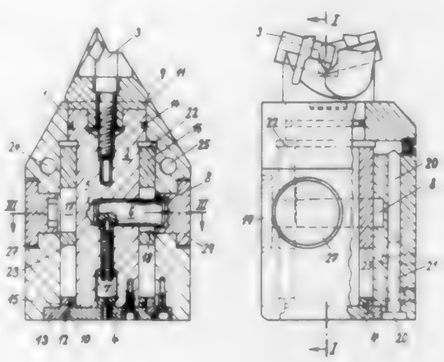


A hand operated tool including an open frame having portions thereof disposed in confronting spaced relation relative to an elongated conduit mounted for rotation about its longitudinal axis, a conduit cutting blade mounted on the frame, means on the frame engaging the conduit and being operable to move and force the cutting blade through the conduit in a direction substantially perpendicular to the longitudinal axis thereof, a beveling knife on the frame, said beveling knife being mounted on the frame in lagging relationship relative to the cutting wheel and being coplanar therewith, the beveling knife being engageable with the conduit within the cut formed by the cutting blade, and means on the frame cooperating with the beveling knife to move, selectively, the beveling knife in directions substantially perpendicular and parallel to the longitudinal axis of the conduit to effect a bevel at the severed ends of the conduit and without forming an internal burr of appreciable size as the beveling tool follows the cutting wheel inwardly relative to the longitudinal axis of the conduit.

3,371,566
TOOLHOLDER
Herbert Gramespacher, Schaffhausen, Switzerland, assignor to Georg Fischer Aktiengesellschaft, Schaffhausen, Switzerland
Filed Dec. 16, 1965, Ser. No. 514,235
Claims priority, application Switzerland, Dec. 30, 1964, 16,827/64
2 Claims. (Cl. 82—36)

The present invention relates to a hydraulically operable turnable toolholder, by means of which the machining tool is turnable about an axis and is held in its respective adjusted working position. The toolholder according to the present invention is characterized primarily in that a rotary piston fixedly connected to the toolholder has rotatably and axially displaceably mounted thereon a sliding member the circumferential portion of which is provided with two inclined slots having shortly ahead of their ends a sharp bend. From these bends the said slots extend to the ends thereof slightly inclined with regard to the axis of rotation of the rotary piston. The toolholder according to the present invention is furthermore characterized in that a bolt fixedly connected to a rotary piston, and a pivot fixedly connected to the housing are

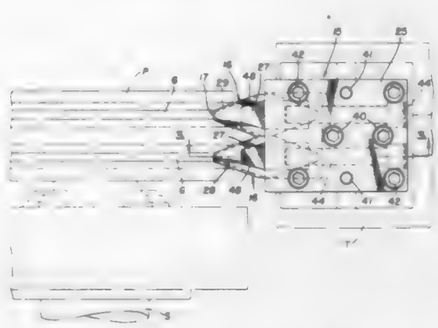
guided for reciprocatory movement in said two slots while said bolt is additionally guided in a semicircular groove in a housing. The said two slots are arranged in the sliding member with regard to the engaging surface of two abutments in such a way that the bolt connected to a rotary piston will, when the toolholder has been turned into the range of its working operation, engage the wall of a slot and the contacting surface of one abutment, said bolt being arrested or clamped fast by hydraulic pressure acting upon the sliding member.



3,371,567
CUTTING TOOL INSERT AND HOLDER ASSEMBLY

Paul Wayne Davis, Columbus, Ohio, assignor to The Capitol Machine Company, Columbus, Ohio, a corporation of Ohio

Filed June 2, 1966, Ser. No. 554,823
5 Claims. (Cl. 82—36)

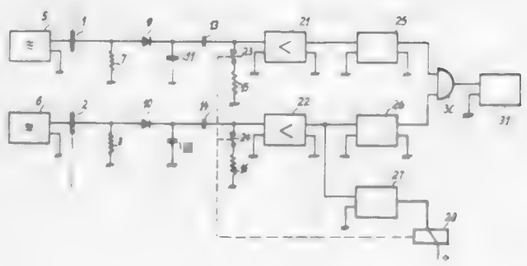


1. A tool insert and holder assembly comprising a pair of superimposed clamping blocks having an outwardly opening socket therebetween for receiving a plurality of inserts disposed in side-by-side edge contacting relationship, and a wedge clamp mounted in said socket for movement into and out of wedging relationship with said inserts, said socket having a pocket for the inserts for receiving them and supporting them with one face exposed, the opposed wall of the socket being angled and converging inwardly toward the first wall, said wedge clamp having a surface for engaging the face of the insert and an opposed angled surface for cooperating with said angled wall, and means for moving said wall clamp in and out of the socket to vary the wedging action on said tool inserts, said pocket being divided into chambers complemental to the shape of the inserts, said wedge clamp including individual wedge members for independently engaging the faces of the respective inserts, said inserts having opposed triangular ends, said chambers being triangular for receiving one end and being formed in one of said blocks, said block having outwardly extending triangular shelves which underlie the opposed outer triangular ends of said inserts.

3,371,568
METHOD AND APPARATUS FOR CHECKING KNOTS

Ernst Felix, Uster, Switzerland, assignor to Zellweger Ltd., Uster, Switzerland, a corporation of Switzerland

Filed Mar. 28, 1966, Ser. No. 537,884
Claims priority, application Switzerland, Mar. 31, 1965, 4,468/65
10 Claims. (Cl. 83—13)

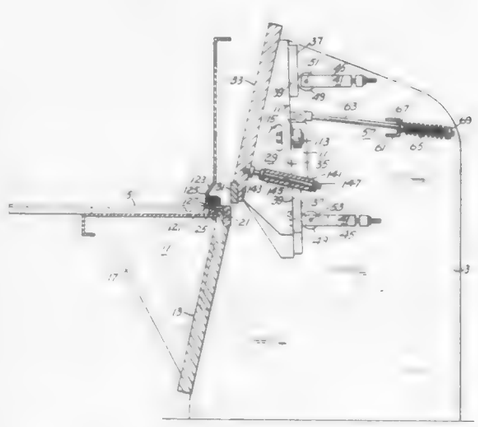


The present invention relates to methods and apparatus for checking knots in threads processed in the textile industry and for removing defective knots. In this invention a plurality of sensors are used to detect both the presence of a knot and the cross section of the thread in the vicinity of the detected knot. A thread cutter is actuated upon detection of the simultaneous presence of both a first signal indicative of the sensing of a knot and a second signal indicative of the sensing of a thread cross section in excess of a predetermined size.

3,371,569
SHEAR MACHINE OR THE LIKE

Eugene W. Pearson, Orinda, and Rolland A. Richardson, Alameda, Calif., assignors to Pacific Press & Shear Corp., a corporation of Illinois

Filed June 28, 1965, Ser. No. 467,210
18 Claims. (Cl. 83—582)



1. A shear machine comprising
a pair of side housings,
a work support spanning said side housings,
means for supporting a lower blade adjacent the rear edge of said work support,
a ram assembly for carrying an upper blade at a rake angle for cooperation with such lower blade in the shearing of material, said ram assembly including a ram having rearward extensions terminating in sub-

stantially vertical bearing surfaces, with said ram disposed at an angle to said surfaces and in a plane substantially intersecting the line of cut during shearing,

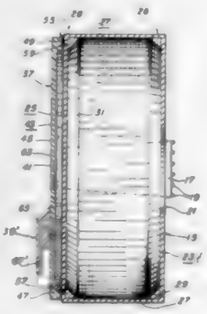
means carried by said side housings for bearing engagement with said substantially vertical bearing surfaces,

means for applying a rearward horizontal component of force to said ram assembly to normally hold said ram assembly in sliding engagement with said bearing engagement means,

and means for applying a vertical component of force to said ram assembly of sufficient magnitude to produce shearing, and a simultaneous forward horizontal component of force in response to the spreading forces developed between blades during shearing

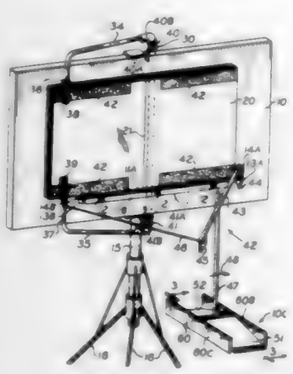
---

3,371,570
STRAPLESS SUPPORT MEANS FOR A GUITAR
Luther D. Lester, Madison Hotel, 223 Madison Ave., Memphis, Tenn. 38103
Filed Mar. 10, 1967, Ser. No. 622,288
5 Claims. (Cl. 84—327)



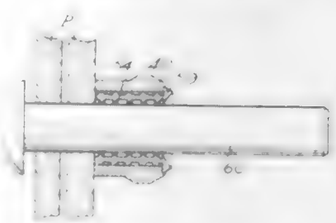
An assembly adapted for securement on the back of a guitar body for supporting the guitar in a playing position. The assembly includes at least one downwardly projecting hook fixed at the back of the guitar body and adapted to be hooked over the belt or waist-encircling garment of the musician or player.

3,371,571
PAGE-TURNING ASSEMBLY
Edmund C. Barbera, 55 Hillandale Road, Rye, N.Y. 10580
Filed Dec. 30, 1964, Ser. No. 422,310
7 Claims. (Cl. 84—502)



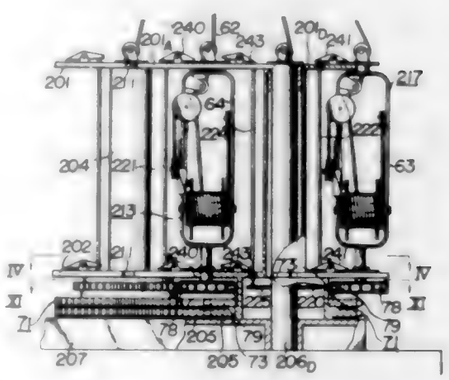
A page-turning apparatus for a book which includes an easel for supporting a book in an upright, open position. A shaft extends transversely with the easel and is mounted for turning movement about an axis parallel and offset from the spine of a book supported on the easel. Arms extend laterally from opposite ends of the shaft and include page-gripping fingers which normally overlie and engage the page adjacent the upper and lower edges of the book. The invention further includes means for biasing the shaft in one direction and means for rotating the shaft in the opposite direction to move the arms through a page-turning sweep of substantial circumference so that the uppermost page at one side of the book is turned by the gripping fingers to the other side of the book as the fingers move laterally out of gripping contact with the page.

3,371,572
LOCKING BOLT AND LOCKING MEANS THEREFOR
John O. King, Jr., 110 Lake Forrest Lane, Atlanta, Ga. 30305
Filed Nov. 1, 1965, Ser. No. 505,825
10 Claims. (Cl. 85—7)



A fastener for attaching material together having aligned openings therethrough comprising a locking bolt having a head, shank portion, and a swageable collar receivable around the shank portion and effective to be swaged around the locking bolt by a swaging tool which forces the collar toward the head of the locking bolt; and further includes a scoring means being retained by the collar adjacent that end of the collar engaged by the swaging tool. The scoring means may be separate or may be an integral part of the insert placed inside of the collar. The scoring means is removed from the collar by forcing the material of the collar retaining the scoring means away from the scoring means to force the scoring means from the collar as an incident of the swaging operation and, if the scoring means is an integral part of the insert, the scoring means is also sheared from the insert as it is removed from the collar as an incident of the swaging operation.

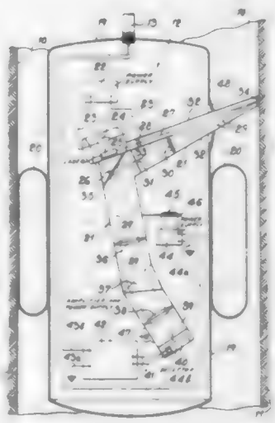
3,371,573
BRAIDING MACHINES
Yoshiaki Koreki, 6–225 Asagaya, Suginami-ku, Tokyo, Japan, and Ryosuke Kondo, 27–3 Higashinakahatu, Katahara-machi, Gamagohri-shi, Aichi-ken, Japan
Continuation-in-part of application Ser. No. 402,720, Oct. 9, 1964. This application Sept. 26, 1966, Ser. No. 581,867
3 Claims. (Cl. 87—37)



A braiding machine with rotating disc assemblies and bobbin carriers mounted thereon. The bobbin carriers

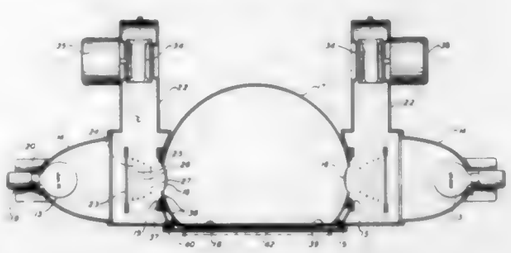
are rotated at the same angular velocity as the disc assemblies but in a reverse direction of rotation to that of the disc assemblies.

3,371,574
OIL DETECTION DEVICE UTILIZING RAMAN RADIATION
Robert J. Dwyer, 46A Seth Court, Staten Island, N.Y. 10301
Filed July 31, 1963, Ser. No. 298,975
4 Claims. (Cl. 88—14)



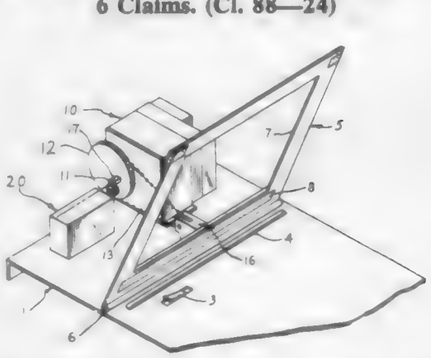
Unitary means for lowering into a bore hole to find oil including a monochromatic radiation source which is a laser, a spectrometer filter, a detector for Raman radiation and a transmitter which takes the scattered Raman radiation filtered on each side of the 3000 reciprocal wave number characteristic of the detected C–H vibration resonance frequency and transmits it in the form of a pulse to the surface of the ground to demonstrate traces of oil in said hole.

3,371,575
ILLUMINATING APPARATUS FOR PHOTOGRAPHIC ENLARGERS PROVIDED WITH INTERCHANGEABLE INTEGRATING BODIES
Alfred Simmon, New York, N.Y., assignor to Simmon Brothers, Inc., Woodside, N.Y., a corporation of New York
Filed Apr. 12, 1965, Ser. No. 447,326
8 Claims. (Cl. 88—24)



1. An illuminating apparatus for photographic enlargers comprising a light source, a light collector, a number of light integrating bodies of different dimensions, and an apertured stage adapted to support a negative or transparency, said light collector including a reflector formed by a substantially elliptical surface of revolution having a specularly reflecting interior surface, said elliptical surface of revolution having two focal points, said light source positioned substantially at one of said focal points, each of said integrating bodies being hollow of substantially spherical shape with a matte diffusely reflecting substantially white interior surface, each integrating body including means defining a relatively large aperture and a relatively small aperture, means positioning any one of said integrating bodies in close proximity to said negative stage with said large aperture in juxtaposition and in alignment with the aperture of said negative stage, and means to adjust the position of said light collector with respect to the position of said integrating body whereby the second focal point of said elliptical surface of revolution is substantially within the area of said relatively small aperture.

3,371,576
ENLARGER EASEL
Charles W. Miller, Cedar Lane Trailer Court, Radcliff, Ky. 40160
Filed July 14, 1965, Ser. No. 471,976
6 Claims. (Cl. 88—24)



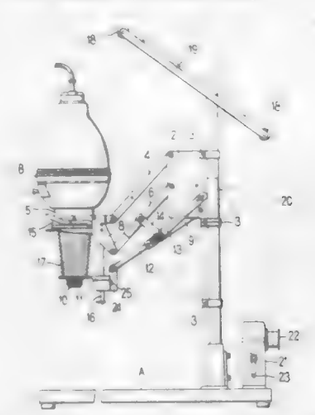
1. An enlarger easel for receiving and "framing" a sheet of sensitized photographic paper while an enlarged image is formed theron, comprising:

(A) a base member providing a receiving surface on which a sensitized sheet is to be operatively centered;

(B) a framing platen mounted for movement relative to said surface into and out of an operative position in which it frames a centered sheet on said sheet-receiving surface; and

(C) platen-moving means operative, in response to the placement of a sheet on said surface, to move said platen into and out of said operative sheet-framing position.

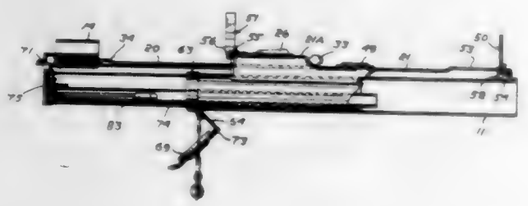
3,371,577
AUTOFOCUS ENLARGER
Shinzaburo Yatera, 3076 Kisabe, Katano-cho, Kitakawachi, Osaka, Japan
Filed Mar. 15, 1965, Ser. No. 439,723
5 Claims. (Cl. 88—24)



An automatic focus adjusting enlarger apparatus, comprising a supporting member, a standing column along which said supporting member is movable in a vertical direction and to which said member can be fixed, an enlarger head, an enlarging lens holder for holding an enlarging lens and mounted on the lower part of the en-

larger head and movable relative thereto along the enlarger axis, a parallel motion means connected between said supporting member and said enlarger head for moving said enlarger head along an axis parallel to the standing column, and a lens holder adjusting linkage connected between said supporting member and said lens holder and also connected to said parallel motion means for moving said lens holder relative to said enlarger head when said parallel motion means moves said enlarger head.

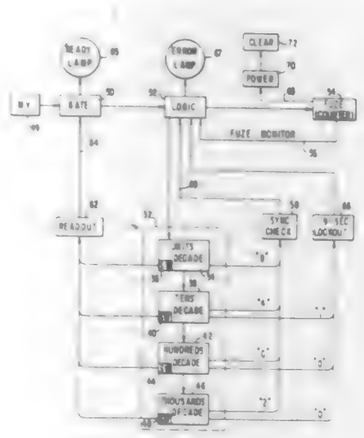
3,371,578
ROCKET LAUNCHERS
Paul V. Choate, Milton, and Frank A. Spinale, Beverly, Mass., assignors to Norris Industries, Inc., Los Angeles, Calif., a corporation of California
Filed June 20, 1966, Ser. No. 558,656
14 Claims. (Cl. 89—1.813)



1. In a rocket launcher, first and second tubular sections telescopingly connected to enable said launcher to be extended from a shortened, inoperative position into an elongated, operative position, one end of said first section being the breech end of the launcher, said first section fitting within said second section, said first section including a first rigid member overlying said second section, said second section and said first member including portions releasably interengaged in said operative position, and means to fire a rocket positioned in said first launcher section, said means including a second rigid member which is the firing member and is movable relative to said first section between a rearward firing position and a forward cocked position, a firing spring tensioned by movement of said firing member into said cocked position, said members including means interengaged to cause their movement together relative to said second launcher section as said launcher is extended and trigger means releasably connecting said firing member to said second section when only a predetermined short further relative movement of said sections is required to establish said operative position, said interengaged means providing for corresponding short movement of the firing member relative to the first member whereby said spring becomes tensioned during said short relative movement, and a safety operable to disengage said interengaged means.

3,371,579
FAILSAFE FUZE-SETTING SYSTEM
Gerald W. Kinzelman, Washington, D.C., assignor to the United States of America as represented by the Secretary of the Army
Filed Dec. 12, 1966, Ser. No. 601,240
8 Claims. (Cl. 89—6)

1. A failsafe fuze-setting system comprising:
(a) a fuze setter comprising:
(1) a setter-counter,
(2) means to read out said counter when a predetermined count is stored therein, and
(3) a count comparison means connected to said setter-counter,
(b) a fuze comprising:
(1) a fuze counter, and
(2) means connecting said fuze counter to said count comparison means, and
(c) means for applying count pulses simultaneously to said fuze setter and to said fuze, whereby said count



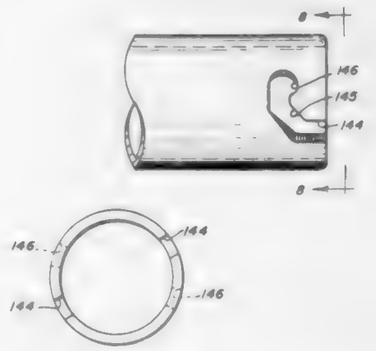
comparison means is operative to produce an error signal when said counters are not in synchronism.

3,371,580
MULTIPLE AXIS MILLING MACHINE AND FIXTURE
Clair E. Barnes and Clint T. Hays, Long Beach, and Richard A. Myers, Rolling Hills, Calif., assignors, by mesne assignments, to McDonnell Douglas Corporation, Santa Monica, Calif., a corporation of Maryland
Filed Jan. 21, 1966, Ser. No. 522,079
10 Claims. (Cl. 90—11)

5. A multiple position work holding fixture for cooperative use with a multiple spindle milling machine having multiple axes of movement, comprising: an upright frame generally defining a vertical plane; support brackets on said frame extending forwardly of its plane; a plurality of horizontally elongate work holding tables pivotally mounted on said brackets for rotation about horizontal axes; said tables being vertically spaced from each other with their axes of rotation all lying in a common vertical plane and having front faces for the reception of substantially identical work pieces; said tables having a neutral position in which said front faces lie in a common vertical reference plane; and means to tilt said tables out of said reference plane in unison about their axes of rotation to exactly the same angular extent for cooperation with a set of identical milling cutters; said

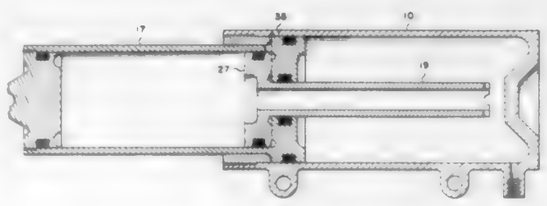
means comprising at least one gear segment secured to each table and lying in a common vertical plane normal to said reference plane; a vertically extending rack vertically movably carried by said frame and having teeth in driving engagement with each of said gear segments; and drive means to reciprocate said rack vertically to rotate each of said gear segments and their associated tables through identical vertical angles.

3,371,581
MILLING APPARATUS
Elmer O. White, Euclid, Ohio, assignor to The National Acme Company, a corporation of Ohio
Filed Feb. 9, 1966, Ser. No. 526,204
11 Claims. (Cl. 90—15)



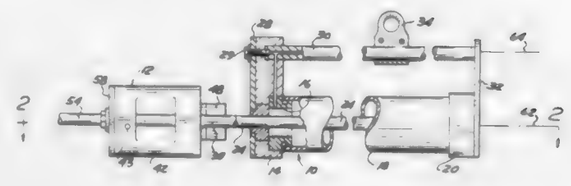
9. The method of making matching bayonet slots located circumferentially 180 degrees from each other in the end portion of an annular workpiece having a bore therein comprising the steps of moving an annular workpiece and a milling cutter which rotates about an axis generally normal to the axis of the workpiece, relatively toward each other in the direction of the workpiece axis to produce longitudinal axial slots in the workpiece of a given length and 180 degrees apart, arcuately moving the milling cutter and workpiece relative to each other about an axis generally parallel to the workpiece axis to produce circumferential slots of a given length and 180 degrees apart, and thereafter retracing the aforementioned movements to remove the milling cutter from the axial extent of the workpiece.

3,371,582
FLUID POWER ACTUATOR
Jacob Schmidt, Van Nuys, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Filed Sept. 16, 1965, Ser. No. 487,664
3 Claims. (Cl. 92—52)



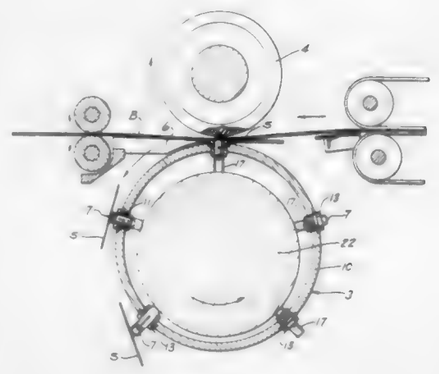
A short, compact double cylinder is provided which consists of a piston within a piston and its cylinder. The inner piston is moved by the main piston at one end of its stroke to reduce the effective force of the main piston. This results in a stepped output force and by predesigning the relative lengths of the piston, the location of the step is established.

3,371,583
MATERIAL-HANDLING DEVICE ACTUATOR
Leland F. Blatt, Grosse Pointe, Mich. (24121 Mound Road, Warren, Mich. 48091)
Filed Mar. 11, 1966, Ser. No. 533,590
1 Claim. (Cl. 92—61)



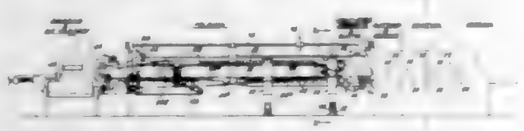
An actuating mechanism for a reciprocating workpiece gripper comprises a pair of parallel fluid actuated power cylinders mounted in tandem so that the gripper actuating cylinder is mounted for reciprocation with the travel cylinder piston rod. Guide rods for the actuating cylinder structure double as conduits for supplying actuating pressure to the actuating cylinder chamber. A support rod for the entire mechanism doubles as a conduit for supplying actuating pressure to the travel cylinder chamber.

3,371,584
SELF-COMBING PIN TYPE STRIPPER FOR BLANK-FORMING APPARATUS
Peter Zernov, Milwaukee, Wis., assignor to Zerand Corporation, Menomonee Falls, Wis., a corporation of Wisconsin
Filed July 8, 1966, Ser. No. 563,797
5 Claims. (Cl. 93—36)



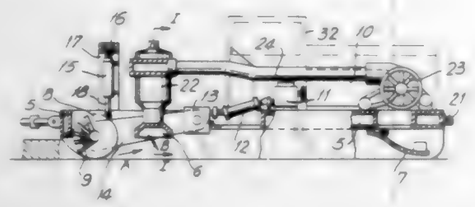
1. Self-combing, pin type stripper mechanism for blank forming apparatus comprising, a rotatable hollow cylinder having a plurality of openings therein, a bushing fixed in said openings and having a radially outer end, said bushing also having a bore extending therethrough and in a generally radial direction, a radially fixed pin mounted in said bore in said bushing and having a sharpened head which extends radially beyond the radially outer end of said bushing for impaling a blank scrap portion, a sleeve slidable in said bore and around said pin for sliding between a position in which it is retracted completely within said bushing and a position in which it extends radially beyond said sharpened head of the pin so as to force a blank scrap portion therefrom, and means within said hollow cylinder for causing said sliding movement of said sleeves in timed relationship with rotation of said cylinder.

3,371,585
GLUED FLAP BOX FOLDING MACHINE
Henry W. Moser, Haddonfield, N.J., and William Grobman, Philadelphia, Pa., assignors, by mesne assignments, to The Langston Company, Camden, N.J., a corporation of New Jersey
Filed Oct. 14, 1963, Ser. No. 316,495
9 Claims. (Cl. 93—52)



1. In a glued flap box folding machine, a folder section, folding belts on each side of said section, said belts being so driven as to fold panels of a box blank inwardly from the top and upwardly into juxtaposition with the remainder of the blank, an upper traction belt, pressure rolls above said upper traction belt, and means resiliently mounting said pressure rolls for automatic adjustment for board thickness throw-out means mounting some of said pressure rolls in proximity to the discharge end of the machine and operable to facilitate jam removal.

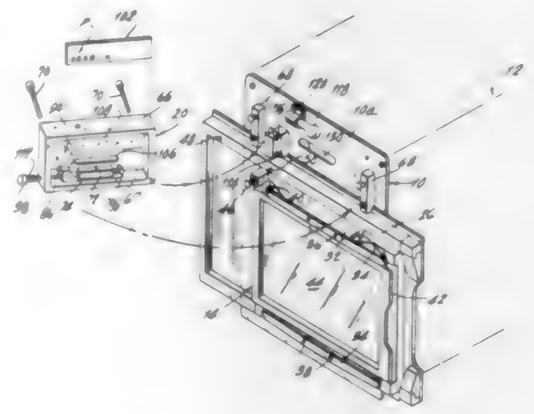
3,371,586
APPARATUS FOR PACKING SNOW TO OBTAIN A SNOW AND ICE COVER SURFACE
Arkady Fedorovich Nikolaev, Ulitsa Gorkogo, 147A, Apt. 8; Evgeny Iljich Malekhanov, Prioksky region, 11 proezd 6, Apt. 3; Stanislav Sergeevich Solovjev, Ulitsa Suetinskaja, 19, Apt. 10; Alexei Stepanovich Khrjapchenkov, Studenchesky pereulok 5, Apt. 12; Vitaly Ionovich Vologdin, "Vuzstroi," 19, Apt. 4; Mikhail Jurjevich Banige, Ulitsa Belinskogo, 122A, Apt. 9; Antonin Ivanovich Smirnov, Ulitsa Estonskaja, 53, Apt. 1; and Davud Rasoolovich Bootaev, Arzamasskoe chausee, 1; all of Gorky, U.S.S.R.
Filed July 30, 1965, Ser. No. 476,088
6 Claims. (Cl. 94—39)



Apparatus comprising an assembly of three detachably coupled units in which the first unit serves to displace the assembly over a snow surface, the second unit comminutes snow and lays down a melted layer on the snow surface and the third unit compacts the layer and snow surface.

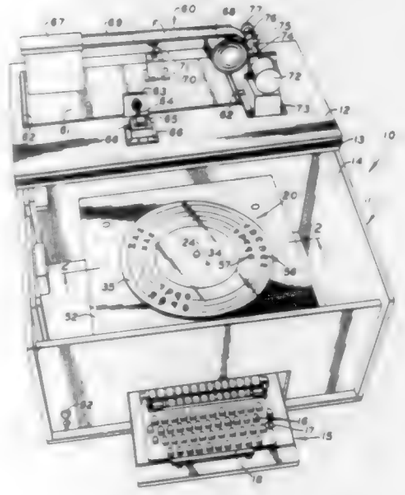
3,371,587
CAMERA POSE COUNTER
Josef Galletta, Brooklyn, N.Y., assignor to Kemex Manufacturing Corporation, Brooklyn, N.Y., a corporation of New York
Filed Aug. 27, 1965, Ser. No. 483,188
2 Claims. (Cl. 95—1.1)

1. The combination with a camera including plural walls and having means mounting film within said camera adjacent the rear wall thereof of a pose counter comprising a number-displaying device presenting numbers in display and including means mounting said device externally on said camera rear wall, a periscope supported on said camera in position for transmitting reflected light from said externally mounted number-displaying device to said internally mounted film, said periscope having one end in alignment with said numbers in display and its opposite end in alignment with an opening to said film in said camera rear wall, wherein reflected light transmitted through said periscope is effective to expose an area on said film with said numbers in display on said number-displaying device including a rotatable wheel displaying circumferentially spaced numbers and means mounting said wheel such that a number thereon forms one of said numbers in display, and means to advance said wheel in rotation for the successive numbering of



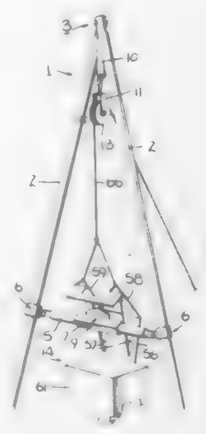
film for identification purposes, and a shutter mechanism and stop means movable between a clearance position relative to said shutter mechanism and an operative position preventing the operation of said shutter mechanism, said stop means being normally in said operative position and operatively connected to said wheel advancing means of said number-displaying device wherein actuation of said wheel advancing means is effective to actuate said stop means into said clearance position permitting the operation of said shutter mechanism.

3,371,588
PHOTOCOMPOSING MACHINE
Frederick C. Tambling, 1921 Burlington Road, Akron, Ohio 44313
Filed Oct. 21, 1965, Ser. No. 499,271
4 Claims. (Cl. 95—4.5)



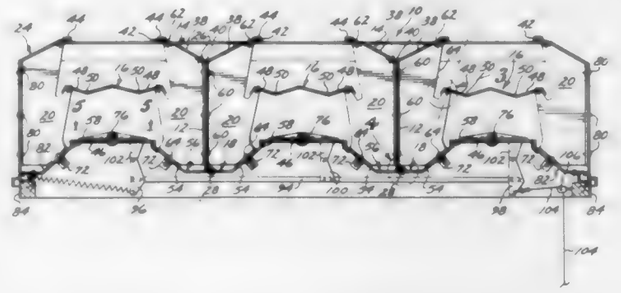
A unitary automatic type composer, having a rotary font disc indexed to an exposure or printing station by selective actuation of a character key on a matrix or keyboard, and having mechanically and electrically interlocked index registry and film or paper transfer devices.

3,371,589
BIPOD CAMERA SUPPORT
Julian Hill Whittlesey, 122 E. 65th St., New York, N.Y. 10021
Filed June 21, 1965, Ser. No. 465,505
8 Claims. (Cl. 95—86)



The camera support consists of an A-shaped frame mounted for pivotal movement at the base of the legs. The camera is mounted on a pulley system from the apex of the A-shaped frame. Pairs of photographs are obtained by pivoting the frame between two spaced points of equal distance from a vertical plane through the base of the frame.

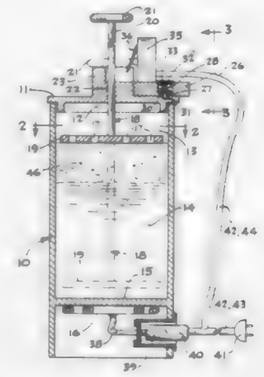
3,371,590
VENTILATOR
Wolfram G. Korff, Granada Hills, Calif., assignor to Western Engineering & Mfg. Co., Los Angeles, Calif., a corporation of California
Filed Jan. 24, 1966, Ser. No. 522,622
2 Claims. (Cl. 98—42)



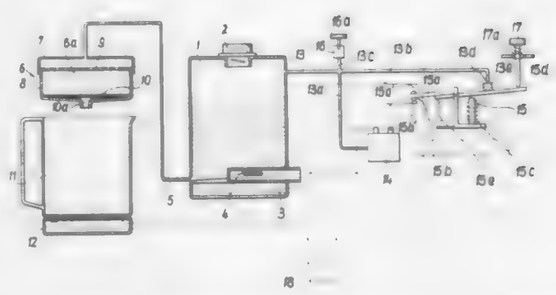
A ventilator having an arrangement of baffles and rain gutters adapted to vent air through a building roof while preventing rain from entering the building, the ventilator being assembled in a manner affording structural rigidity for long spans and affording damper actuation without torsional bending of the damper.

3,371,591
COFFEEMAKER
Edward C. Vandenburgh III, 31 Elizabeth Lane, Barrington, Ill. 60010
Filed Oct. 20, 1966, Ser. No. 588,056
6 Claims. (Cl. 99—281)

1. A coffeemaker for use in brewing coffee from ground coffee beans and adapted to be connected to a source of electricity, said coffeemaker comprising: pot means; a support movable vertically in said pot; an electrical heater for said pot for boiling the water in the pot; circuit means including a switch, said circuit means being connected to said heater and adapted to connect the heater to said source of electricity; and operating means operatively connecting said support and the switch for the switch to have one setting at an elevated position of the support and the switch to have a second setting at a lowered position of the support; said switch being connected to the heater so that the heat supplied to the pot at said one setting is sufficient to boil water therein while the heat supplied at the second setting is not sufficient to boil water therein; whereby said pot may be filled with water and said ground beans floated thereon with the floating beans carrying said support with said switch being at said first setting, said support having sufficient weight that when said beans fail to carry said support as a result of said boiling, said support will sink and change said switch to said second setting.



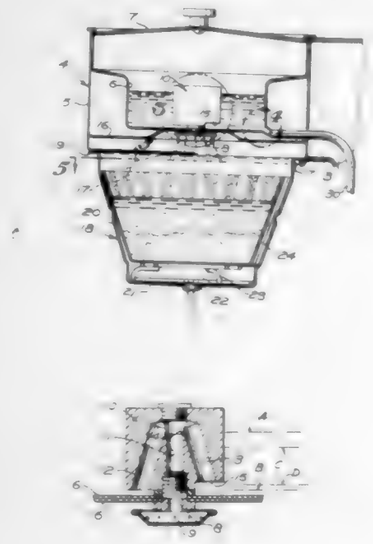
3,371,592
ELECTRIC COFFEEMAKER FOR DOMESTIC USE
Hermann Remy, Dietzenbach-Steinberg, near Offenbach am Main, and Kurt Wohlfart, Offenbach am Main, Germany, assignors to Rowenta Metallwarenfabrik G.m.b.H., Offenbach am Main, Germany
Filed Nov. 9, 1966, Ser. No. 593,013
Claims priority, application Germany, Nov. 20, 1965, R 42,031
12 Claims. (Cl. 99—282)



1. An electric coffeemaker comprising in combination:
(a) a pressure tight closed water boiler;
(b) a pressure tight receptacle for coffee ground connected to said boiler;
(c) an electrically operated air pump connected to said boiler for pressure feeding of water from the boiler to said receptacle by a build-up of air pressure in the boiler;
(d) electric heating means for heating water in said boiler;

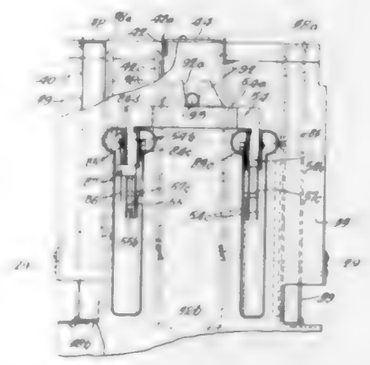
(e) an open air venting pipe connected to said boiler;
(f) a movable closure means for closing said venting pipe;
(g) an electromagnetic relay means controlling said boiler heating means, said pump and said closure means, said relay means in a first state of energization energizing the heating means and opening the venting pipe; and
(h) a temperature sensitive control means controlling said relay means to change the state of energization thereof from the first state to a second state and controlled by said boiler reaching a predetermined temperature;
(i) said change in the state of energization of said relay means causing movement of said closure means into the venting pipe closing position, disconnection of the heating means and starting of the pump.

3,371,593
COFFEE BREWING APPARATUS
Gail A. Price, Inglewood, Calif., assignor to Farmer Bros. Co., Torrance, Calif., a corporation of California
Continuation-in-part of application Ser. No. 373,240, June 8, 1964. This application June 10, 1966, Ser. No. 556,667
9 Claims. (Cl. 99—283)



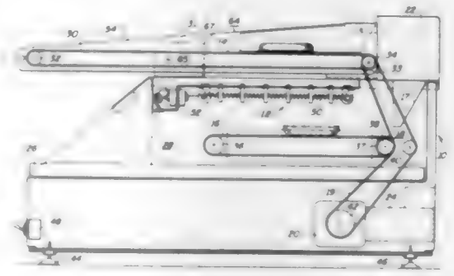
1. A coffee brewing apparatus, comprising:
(a) a hot water supply means including a tank, means for supplying a predetermined quantity of water to said tank for discharge of a like quantity of water therefrom, and a heating element to heat the water therein to brewing temperature;
(b) a brewing water receiver in communication with said tank;
(c) a spray nozzle for discharge of brewing water from said receiver;
(d) a siphon interposed between said spray nozzle and said receiver for delaying flow of brewing water from said spray nozzle until the water level in said receiver has reached a predetermined upper level and to terminate the flow of brewing water when the water has reached a predetermined lower level;
(e) the communication between said receiver and said tank being so arranged that, any water, due to expansion or presence of occluded gases, as said water is heated, which is in excess of the water supplied to said tank, is collected in said receiver, and is permitted to return to said tank as the temperature of the water reaches equilibrium;
(f) and a brewing vessel adapted to receive a filter and coffee, and adapted to be positioned under said spray nozzle for discharge of brewed coffee into a decanter.

3,371,594
BREAD TOASTER
Douglas F. Illian, Oak Park, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed July 26, 1966, Ser. No. 568,051
19 Claims. (Cl. 99—329)



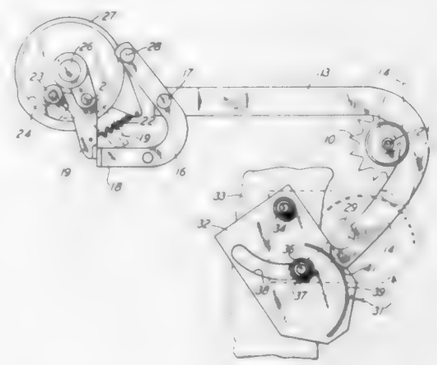
1. An automatic self-lowering toaster comprising a housing, spaced heating elements within said housing, a bread carriage movable between a raised position in which a piece of bread on the carriage protrudes from said housing and a lowered position in which said piece of bread is positioned between said heating elements, a thermal motor, linkage means interconnecting said carriage and said thermal motor to move said carriage to the lowered position on energization of said thermal motor, and means actuated by a slice of bread placed on said carriage to energize said thermal motor, said linkage including a resilient element which permits said carriage to be operated manually from said raised position to said lowered position independently of said thermal motor.

3,371,595
ENGLISH MUFFIN TOASTER
Peter S. Peters, Milton, Mass., assignor to Interstate Fabrications, Inc., Dorchester, Mass., a corporation of Massachusetts
Filed May 27, 1966, Ser. No. 553,563
10 Claims. (Cl. 99—352)



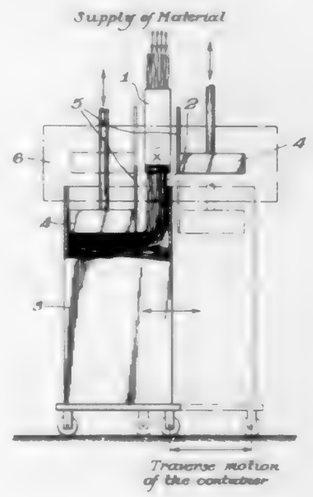
A continuous toaster for the severed sides of English muffin halves having a variable preheat cycle and a toasting cycle. Transfer means are provided to deliver the English muffin halves from the variable preheat cycle in the proper attitude to expose the severed sides of the English muffin halves to the toasting cycle.

3,371,596
BALE LENGTH CONTROL DEVICE
Carl D. Nelson, De Witt, Iowa, assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Filed Oct. 12, 1966, Ser. No. 586,109
3 Claims. (Cl. 100—4)



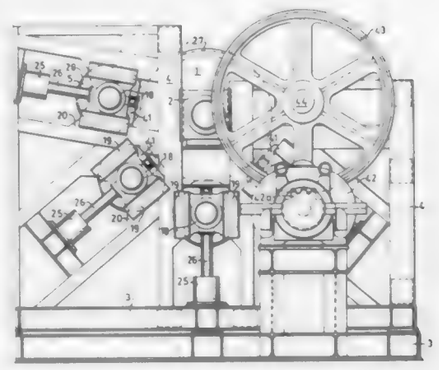
1. In a bale length control device for use on a hay baler of the type having bale tying means, the improvement comprising a movable trip arm for controlling said tying means, a stop having an abutment surface disposed transverse to and in the path of movement of said trip arm, a pivot mounting for said stop, combined pivotal limiting and securing means connected to said stop for holding the latter in selected pivotal positions, said abutment surface being sufficiently extended and the pivot axis of said stop being located with respect to the path of movement of said trip arm to have said abutment surface abut said trip arm in all pivotal positions of adjustment of said stop.

3,371,597
PROCESS AND DEVICE FOR LAYING DOWN CONTINUOUS SPINNING CABLES
Artur Buchalla, Bobingen, near Augsburg, and Martin Uschkoreit, Augsburg, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, Frankfurt am Main, Germany, a corporation of Germany
Filed Feb. 17, 1965, Ser. No. 433,316
Claims priority, application Germany, Feb. 20, 1964, F 42,060
3 Claims. (Cl. 100—80)



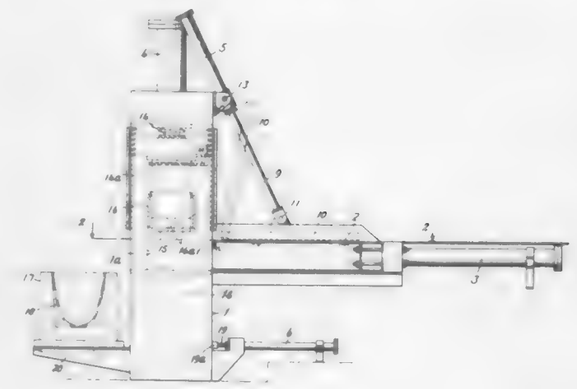
Laying down continuous spinning cable material in a container by means of a mechanism performing traverse motions and compressing the material in one-half of the movable container each time after a double layer of the spinning cable material is laid down.

3,371,598
BARK PRESS
Thure Waplan, Saltsjo-Duvnas, Sweden, assignor to Waplans Mekaniska Verkstads a.-b., Vaplan, Sweden, a corporation of Sweden
Filed Sept. 21, 1965, Ser. No. 488,967
Claims priority, application Sweden, Sept. 24, 1964, 11,613/64
6 Claims. (Cl. 100—166)



A bark press comprising a central roller, at least four squeeze rollers mounted in movable bearings and elastically pressed toward the central roller, and scrape and guide members intermedate the squeeze rollers for removing bark from one squeeze roller and guiding the bark to the gap between the following squeeze roller and the central roller. The central roller and squeeze rollers have longitudinal indentations for breaking up and advancing the bark and complementary peripheral ridges which facilitate the squeezing of liquid from the bark.

3,371,599
SCRAP COMPRESSING APPARATUS FOR ELECTRIC FURNACES
Kunitoshi Tezuka, 34 7 Minami Sunamachi, Koto-ku, Tokyo-to, Japan
Filed Oct. 22, 1965, Ser. No. 500,819
Claims priority, application Japan, Sept. 28, 1965, 40/58,933
1 Claim. (Cl. 100—215)



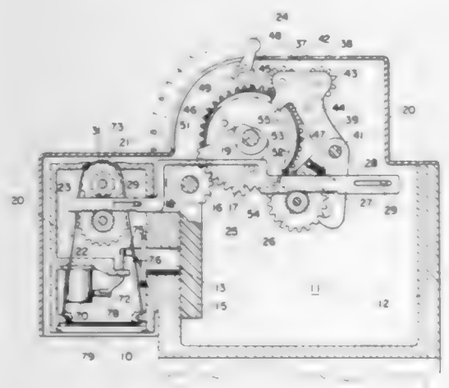
A horizontal pressing cylinder with a semi-circular portion first compresses scrap material against a correspond-

ing portion. A vertical compressing cylinder then compresses the scrap into a cylindrical and somewhat concave casing. The vertical compressing cylinder is equipped with a plunger having cross plates at the undersurface thereof and a pressing plate mounted towards the bottom thereof. The cross plates can pass through channels in the pressing plate. Rotation of the vertical compressing cylinder further compresses the scrap into the casing.

3,371,600
POSTAGE METER AND STAMPING MACHINE COMBINATION

Teresa L. Hill, 3225 Berkley Road 16506, and Charles L. Lovercheck, 632 W. 7th St. 16502, both of Erie, Pa.

Filed Mar. 21, 1966, Ser. No. 535,890
2 Claims. (Cl. 101—45)



The postage meter and stamping machine disclosed herein is provided with a printing mechanism incorporating printing indicia made of ink impregnated rubber. This eliminates the necessity of having an inking mechanism to apply ink to the indicia after each stamp has been printed. Therefore, the inking mechanism is eliminated, yet the function of the inking mechanism is retained by providing the ink impregnated rubber.

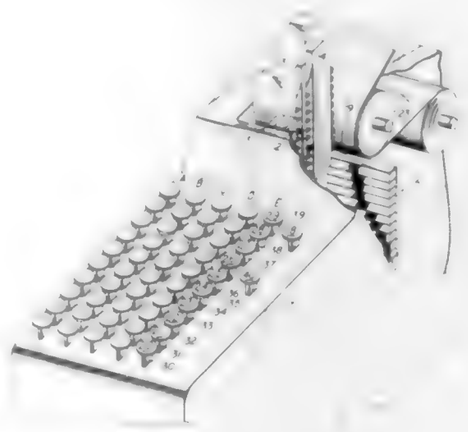
3,371,601
SELECTIVE TYPE BAR AND INK PAD ARRANGEMENT

Leslie C. Lane, Jr., Stamford, Conn., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

Filed Feb. 9, 1966, Ser. No. 526,194
5 Claims. (Cl. 101—93)

Type bars each having all the symbols of a coded system, the type bars being movable to bring a particular symbol into alignment with a printing surface such as paper on a platen, preferably the bars being raisable as in an old fashioned hand operated printing adding machine. In the rest position, the bars are all aligned the same way and are in contact with a zoned inking pad, each symbol on each bar being in contact with the only one zone on the pad which is inked with a coding ink having present one or more coding components which photoluminesce under ultraviolet light in different colors, the particular coding component or combination of coding components constituting the code for the particular symbol. The inks may contain only the photoluminescent coding components which are ordinarily uncolored and so permit a code which is secret and which does not require that the symbols be shaped. Preferably the symbols are shaped and if desired pigment may be present in each zone of the inking pad so that symbols may be recognized visually as well as by examination under ultraviolet light.

The symbols are selected by keys, which in the preferred case raise each bar to the height corresponding to the particular symbol. Moving the bar up first moves it out of contact with the inking pad and then raises it. When all of the bars have been raised to their particular

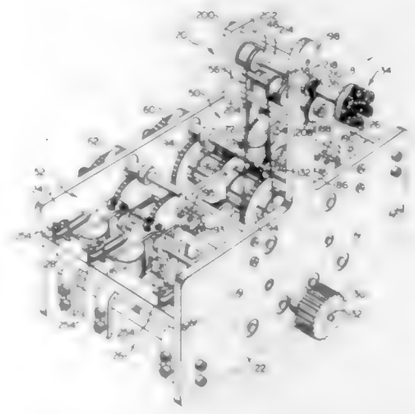


selected heights, printing is effected by bringing in contact the aligned symbols, either by moving the bar as a whole or preferably with bars having each symbol on an individual hammer, by moving the hammer only. The keyboard is then cleared for another series of symbols.

3,371,602
SERIAL TYPE PRINTER WITH DISC-TYPE CARRIER

Joseph F. Cattorini, Xenia, Donald E. Landis, Bellbrook, and Larry L. Leiter, Centerville, Ohio, assignors to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland

Filed Apr. 18, 1966, Ser. No. 543,429
7 Claims. (Cl. 101—93)

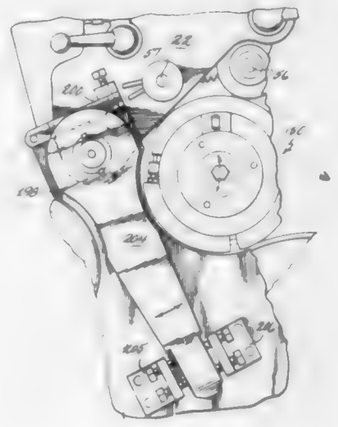


A printing apparatus which utilizes a disc-type carrier having a plurality of type wheels rotatably mounted thereon and operatively connected to a sun gear which can simultaneously rotate all the type wheels. On-off spring-type clutch members are used to actuate cam members which cooperate with constant length belts to rotate the carrier and the sun gear so as to position a preselected type wheel and printing character thereon in printing relation with a platen in the apparatus. The clutch members are actuated in response to the Hollerith code.

3,371,603
INTERCHANGEABLE INKING UNIT FOR MULTI-COLOR PRESSES

Ward E. Brigham, Rutherford, N.J., assignor to Sun Chemical Corporation, New York, N.Y., a corporation of Delaware

Original application June 3, 1963, Ser. No. 284,868, now Patent No. 3,223,028, dated Dec. 14, 1965. Divided and this application Aug. 19, 1965, Ser. No. 479,456
5 Claims. (Cl. 101—175)

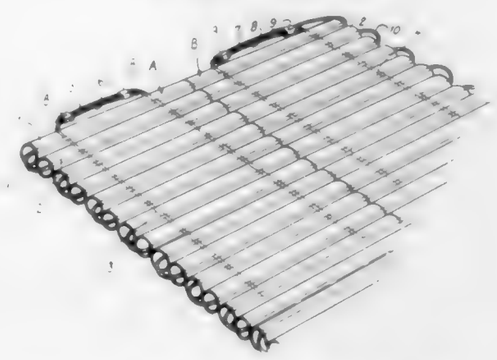


A printing press is provided with adjustable supports for removably mounting interchangeable complete inker units thereon.

3,371,604
BLASTING MAT

Per Folke Wikner and Knut Lundgren, Lidingo, Sweden, assignors to Curt Fredrik Lundin and Johannes Hans-Udo Elbert Speer, Stockholm, Sweden

Filed May 26, 1966, Ser. No. 553,213
Claims priority, application Sweden, May 31, 1965, 7,059/65
6 Claims. (Cl. 102—22)



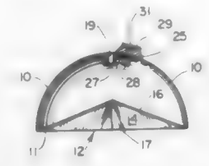
A blasting mat having at least one row of connected adjacent tubes disposed parallel to one another and so arranged that at least at the instance of detonation a longitudinal vent is defined by the curved surfaces of adjacent tubes. At least one rope is provided which passes longitudinally through the tubes in a tortuous path and transversely through the walls of the tubes to form a reinforcing and binding rope network lock. The ends of the ropes are joined together by means of a clamp, or the like.

3,371,605
SHAPED EXPLOSIVE CHARGE

Robert E. Eckels, 2101 Youngfield, Golden, Colo. 80401

Filed July 5, 1966, Ser. No. 562,543
7 Claims. (Cl. 102—24)

A shaped explosive charge having a cup-shaped body is provided with a shaped recess therein produced by four intersecting V-shaped depressions, each such depression being formed of two intersecting planar surfaces, and the recess extending over about two-thirds of the diameter

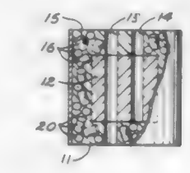


of the charge. The resultant jet pattern from detonation is a central maximum jet with four radially extending linear jets.

3,371,606
EXPLOSIVE BOOSTER FOR RELATIVELY INSENSITIVE EXPLOSIVES

Melvin A. Cook, 631 16th Ave., Salt Lake, Utah 84103, and Robert H. Clay, 728 West 3800 South, Bountiful, Utah 84010

Filed July 18, 1966, Ser. No. 565,774
9 Claims. (Cl. 102—24)



A powerful booster for use with highly insensitive explosives is made up by placing a small, consistently cap-sensitive core of pentolite, pentaerythritol tetranitrate or equivalent, in the center of a suitable mold, packing grains of smokeless powder around the core, and pouring molten TNT or equivalent to cover the grains and thus to form a powerful cast composite sheath of cap-insensitive explosive having high brisance around the core. The grains expedite cooling and make a denser, cavity-free product. The sheath and core are provided with one or two openings so that a cap or detonating fuse may be inserted into the core. The mold may be cylindrical, frusto-conical, etc., for convenient production.

3,371,607
ARRANGEMENT FOR INCREASING THE SAFETY AGAINST UNINTENTIONAL INITIATION OF SO-CALLED LOW ENERGY DETONATING CORD ASSEMBLIES

Per O. I. Olsson, Gyttorp, Sweden, assignor to Nitro Nobel AB, Gyttorp, Sweden, a company of Sweden

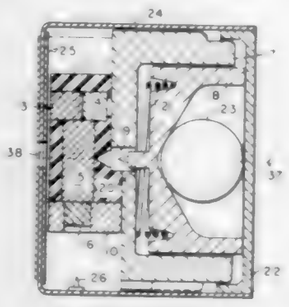
Continuation-in-part of application Ser. No. 428,660, Jan. 28, 1965. This application Aug. 16, 1966, Ser. No. 580,844
3 Claims. (Cl. 102—27)

1. A low energy detonating cord assembly comprising a detonating cord, including, a central, elongated core of high velocity, detonating explosive, a metallic annular tube immediately surrounding said core, at least one annular layer of insulating material immediately surrounding said metallic tube; a booster cap, including, a cap-type, metal exterior shell having one end closed and its opposite end at least partially surrounding and in contact with said insulating layer at one end of said detonating cord; a blasting cap, including, a cap-type metal exterior shell having one end closed and its opposite end at least partially surrounding and in contact with said insulating layer at the other end of said detonating cord; a wire-like electrical conducting means, electrically connecting the outer lateral wall of said anular tube to the inner lateral wall of at least one of said blasting cap shell and

said booster cap shell and passing through a substantial portion of said insulation, whereby detonation of said

assemble by stray electrical current is substantially reduced.

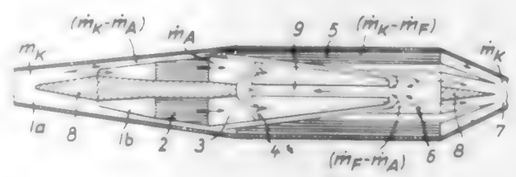
3,371,608
FUZE WITH DELAY FIRING AND IMPACT FIRING FEATURES
George Webb, Richmond, Ind., assignor to Avco Corporation, Richmond, Ind., a corporation of Delaware
Filed June 1, 1967, Ser. No. 642,931
5 Claims. (Cl. 102—72)



This fuze is adapted to be installed in a spinning missile or bomblet. It provides for either delayed firing or impact firing. A weighted slider carries a first ignition train for delayed firing and a second ignition train for impact firing. In response to spin, the slider moves the first ignition train into contact with a first firing pin and sets up conditions for delayed firing. Additionally, it aligns the second ignition train with a second firing pin so that impact firing occurs in response to displacement of or relative to the second firing pin. Adjacent the second firing pin is a ball bearing. Transverse impact forces cause firing by moving the ball against the second firing pin. A spring is interposed between the second firing pin and the housing frame which secures the slider so that the second firing pin and ball move to cause firing on impact with the slider end of the fuze. The housing frame moves to cause firing in the event of axial impaut forces with the ball end of the fuze.

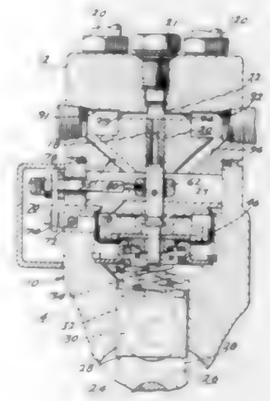
3,371,609
CONVERTER APPARATUS
Reinhart Radebold and Hermann Lang, Grosswelzheim, Germany, assignors to Licentia Patent-Verwaltungs-G.m.b.H., Theodor-Stern-Kai, Frankfurt am Main, Germany
Filed Apr. 26, 1965, Ser. No. 450,750
Claims priority, application Germany, Apr. 25, 1964, L 47,744
4 Claims. (Cl. 103—1)

A magneto-hydrodynamic energy converter operating on the ram jet tube principle in which the working medium is a liquid and the stream of the working liquid before it enters into the heat source is separated into two stream components of which the first is cooled and the second is regeneratively heated. After this they are at different places injected into the stream component which



has passed through the heat source and has had its pressure reduced in a plurality of steps between which liquid working medium is admixed with the partly pressure-relieved vapor.

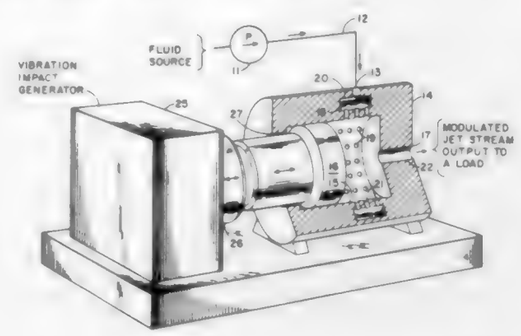
3,371,610
AUXILIARY FILLING MEANS FOR FUEL INJECTION PUMPS
Frank De Luca, Thompsonville, Conn., and Theodore S. Chmura, Chicopee, Mass., assignors to American Bosch Arma Corporation, Springfield, Mass., a corporation of New York
Filed Feb. 16, 1966, Ser. No. 527,885
11 Claims. (Cl. 103—2)



Auxiliary filling means for single plunger distributor type fuel injection pumps comprising in a preferred form one or more axial grooves in the bore of the control sleeve adapted to provide communication between the sump and a spill port of the plunger and hence the fuel distribution chamber during the suction stroke of the plunger. In another form, the auxiliary filling means comprises at least one fill port in the plunger connected with the plunger bore and axially spaced above the spill ports, the fill port being adapted to communicate with the sump during a portion of the plunger suction stroke.

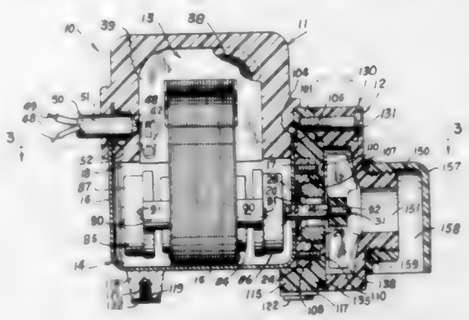
3,371,611
HYDRAULIC APPARATUS
Larry M. Ogden and Boyd A. Wise, Penfield, N.Y., assignors to General Dynamics Corporation, a corporation of Delaware
Filed Aug. 31, 1965, Ser. No. 483,942
3 Claims. (Cl. 103—53)

An apparatus for developing a modulated jet stream output which comprises a chamber which is filled by a fluid source, inlet means disposed between the fluid source and the chamber which have a high impedance to modulated fluid flow, but a low impedance to steady state flow, so that when a piston in the chamber operates to develop



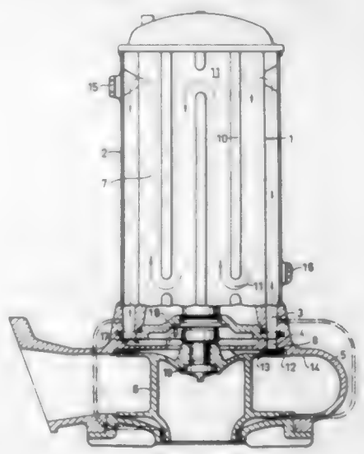
a modulated jet stream, the fluid source is effectively decoupled from the chamber.

3,371,612
DRIVER UNIT
T. Dwight Aller, 4201 Stanford, Dallas, Tex. 75225
Filed Dec. 28, 1965, Ser. No. 517,008
7 Claims. (Cl. 103—87)



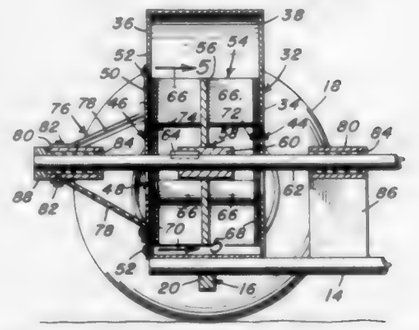
An immersible pump whose driver means is sealed in a housing.

3,371,613
SEWAGE PUMP OR THE LIKE
Jens Karl Adolf Dahlgren, Stockholm, and Carl Evert Sjöstrand, Solna, Sweden, assignors to Stenberg-Flygt AB, Solna, Sweden, a corporation of Sweden
Filed Apr. 21, 1966, Ser. No. 544,160
Claims priority, application Sweden, Apr. 30, 1965, 5,741/65
5 Claims. (Cl. 103—87)



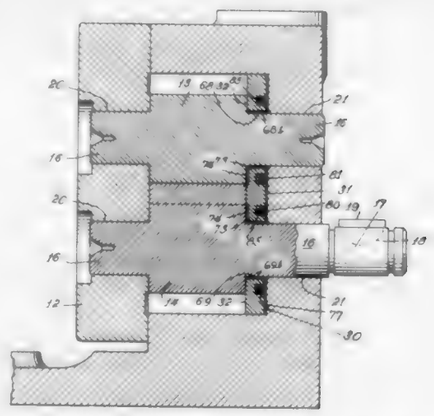
A water cooled sewage pump having a cooling chamber surrounding the pump motor which receives cooling water by forced circulation from the pumped sewage. The pump impeller is provided with vanes which draw water from the pumped sewage while separating the sludge therefrom and causes it to circulate through the cooling chamber.

3,371,614
CENTRIFUGAL PUMP
Angelo J. Crisafulli, P.O. Box 1051, Glendive, Mont. 59330
Filed Apr. 18, 1966, Ser. No. 543,146
12 Claims. (Cl. 103—104)



A wheeled carrier mounted centrifugal pump to be wheeled into a body of water to effect the pumping of water therefrom without requiring the setting up of an intake conduit for the pump. The pump includes a volute housing having axially opposed intake ports, an impeller means within the volute housing carried by a through shaft extending externally of the intake ports and supported by shaft bearing means disposed outwardly of the intake ports. The centrifugal pump is provided with a drive shaft means, comprising an extension of the impeller support shaft, which is adapted to be power driven from the power take-off of an operatively associated device such as a tractor, for example. The impeller shaft bearing support means also provide a vortex reducing or eliminating means should the intake ports of the pump not be completely submerged. The pump impeller preferably includes dual suction impeller means carried on opposed sides of a generally imperforate central disk.

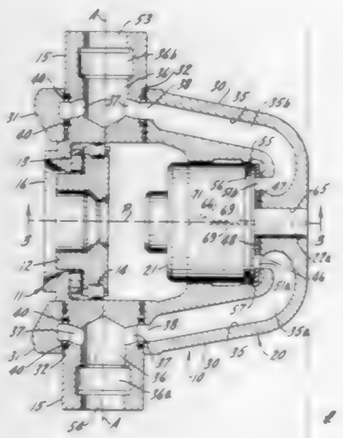
3,371,615
PRESSURE LOADED PUMP
Austin E. Pettyjohn, Auburn, Ind., Ralph J. Riblett, Wooster, and Robert R. Davidson, Elyria, Ohio, and James R. Cox, Fort Wayne, Ind., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Continuation of application Ser. No. 572,494, Aug. 15, 1966. This application Jan. 16, 1967, Ser. No. 609,686
12 Claims. (Cl. 103—126)



An improved pressure loaded pump having a one-piece wear plate mounted between the pump gears and the housing. The wear plate has a groove on the face ad-

jacent the pump end wall which is of a "spectacle" shape and in which is assembled a sealing member and a resilient member. Fluid pressure in the groove urges the sealing member into contact with the end wall to define pressure loading zones on the wear plate.

3,371,616
FLUID DEVICE
Gunnar A. Wahlmark, 211 S. Rockford Ave., Rockford, Ill. 61108
Filed June 18, 1965, Ser. No. 465,120
7 Claims. (Cl. 103—162)



A swash plate type fluid device in which the cylinder barrel rotates in bearing relationship against a bearing surface on a port plate. The bearing surface includes two 180 degree sections disposed at a slight angle to each other, and a barrel rotates in parallel, bearing relationship against only one of these sections on its pressure side to assure a uniform bearing relationship. The angularly related surface sections are achieved by splitting the trunnion-cylinder head of the device on the axis of rotation of the barrel and reassembling the two split sections about three positioning pins, one of which permits the head segments to incline slightly toward each other, causing the plate support surface to comprise two 180 degree canted sections and the tightly fastened plate to bend and acquire the same angular configuration.

3,371,617
PUMP HAVING COMBINATION CHECK VALVE AND SHUTOFF VALVE
Norman W. Klootwyk, Marshall, Mich., assignor to S. H. Leggitt Company, Marshall, Mich., a corporation of Michigan
Filed Aug. 9, 1965, Ser. No. 478,374
7 Claims. (Cl. 103—178)

1. In a combined pump and flow control valve construction, the combination comprising:

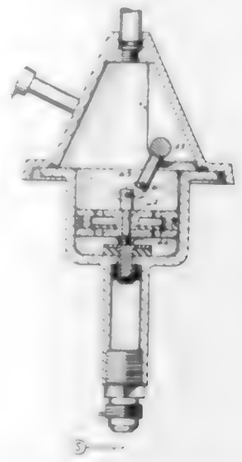
a cylinder having inlet and outlet openings and a wall reciprocable within said cylinder for pumping liquid in a direction from said inlet to said outlet;

actuating means for reciprocating said wall, said actuating means including an arm pivotably mounted relative to said cylinder for angular oscillation relative thereto;

a valve seat associated with said cylinder;

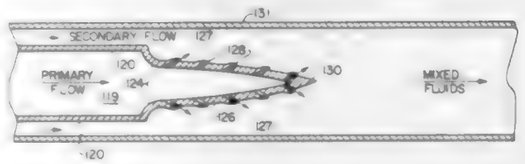
a movable flow control valve member engageable with said seat, said wall being actuatable to a terminal position to engage and urge said movable valve member against said seat so that flow through the pump is prevented when the wall is in said terminal position; and

nonresilient lock means engageable with said arm for positively mechanically locking said wall in said terminal position in which it bears firmly against said



movable valve member positively to maintain said valve closed despite relative high fluid pressure in said inlet.

3,371,618
PUMP
John Chambers, Rte. 1, Box M41, Del Mar, Calif. 92014
Filed Feb. 18, 1966, Ser. No. 528,464
11 Claims. (Cl. 103—258)

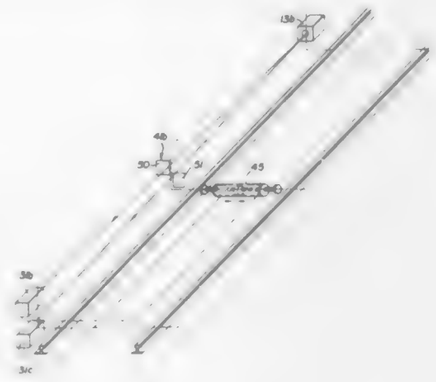


Jet pumps including a mixing chamber throughout the length of which a substantially constant static pressure is maintained, an arrangement for accelerating a primary fluid and introducing it into the upstream end of the mixing chamber to induce a flow of secondary fluid into the chamber in a direction generally parallel to that of the primary fluid, and an arrangement for taking off the primary and secondary fluids at the downstream end of the mixing chamber.

3,371,619
MEANS FOR DETERMINING TRACK ALIGNMENT
John Kenneth Stewart, Dorval, Quebec, Canada, assignor, by mesne assignments, to Tamper Inc., Columbia, S.C.
Continuation of application Ser. No. 526,946, Jan. 20, 1966, which is a continuation of application Ser. No. 315,239, Oct. 10, 1963. This application Jan. 24, 1967, Ser. No. 611,470
Claims priority, application Canada, Oct. 15, 1962, 860,141
21 Claims. (Cl. 104—8)

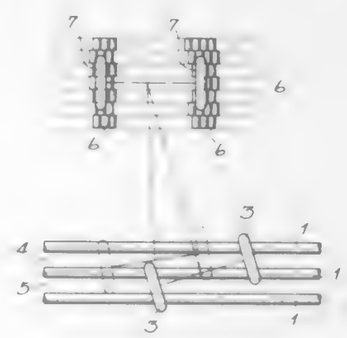
1. Apparatus for determining the horizontal misalignment of a railway track comprising a system adapted to run on the track; means for biasing the system against a reference rail; high frequency beam transmitter means mounted on the system to transmit longitudinally of the track; a pair of beam receivers on the system spaced from the transmitter and aligned to receive the transmission

from said transmitter means; and beam interference means on the system and associated with each of said beam receivers and adapted to be responsive to discrepancies in horizontal track alignment; said beam interference means being located between said transmitter means and said



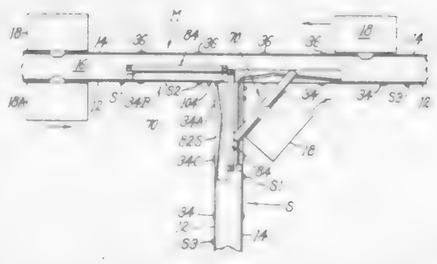
receivers; one of said receivers being operative to produce a signal when the track is out of horizontal alignment in one direction and the other of said receivers being operable to produce a signal when the track is out of horizontal alignment in the opposite direction.

3,371,620
APPARATUS FOR DISPLACING A CAR
Eiji Furukawa, Chiba-shi, Japan, assignor to Daido Yusoki Kabushiki Kaisha, Tokyo, Japan, and Hitachi Zosen Kabushiki Kaisha, Osaka, Japan, both corporations of Japan
Filed Dec. 13, 1965, Ser. No. 513,294
Claims priority, application Japan, Dec. 17, 1964, 39/71,522
2 Claims. (Cl. 104—35)



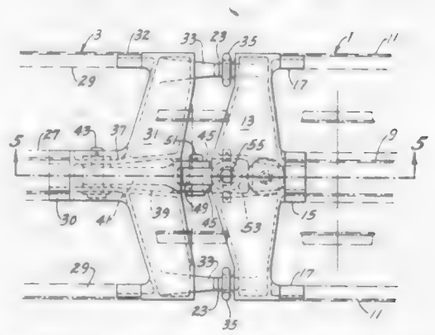
1. Means for the lateral displacement of a car having a pair of driving wheels at one end and at least one additional wheel at the opposite end of said car comprising three parallel rotatably mounted rollers secured to a horizontal supporting surface and spaced apart a fixed distance and including two outer rollers and an intermediate roller, the spacing of each said outer roller from said intermediate roller being less than the diameter of said driving wheels and sufficiently close together to maintain the lowermost portion of each driving wheel, when disposed on a corresponding pair of rollers, spaced from said supporting surface, one of said outer and intermediate rollers supporting one of said car driving wheels and the other of said outer and said intermediate rollers supporting the other of said car driving wheels, said car driving wheels, when driven, rotate said three rollers, and a plurality of relatively small rotatably mounted rollers in said supporting surface positioned for supporting said additional wheel with the axis of said small rollers extending laterally of the axis of said additional wheel, and to the axes of said three parallel rollers, the spacing between adjacent ones of said small rollers, in a direction normal to the axes of said last mentioned rollers, being less than the width of the said additional wheel, and the length of the supporting surface in which said small rollers are mounted being substantially coextensive with the length of the supporting surface in which said first named rollers are mounted when measured in the direction of the axes of said first mentioned rollers.

3,371,621
RACK TRANSFER DEVICES
Edward S. Babson, Ipswich, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey
Filed June 8, 1966, Ser. No. 556,125
6 Claims. (Cl. 104—172)



1. In a system for conveying article carrying units, at least two stationary track portions arranged in a configuration including an inside corner, driving wheels along each stationary track portion for propelling the units, an elongated stationary shoulder on each of said track portions for maintaining the units in engagement with the driving wheels, a transfer mechanism for moving the units past the inside corner from one stationary track portion to the other comprising a movable shoulder, and means first to locate said movable shoulder in a position in alignment with one of said stationary shoulders to receive an article carrying unit and then while the unit is in engagement with the transfer mechanism to locate the movable shoulder in a delivery position in alignment with the second stationary shoulder.

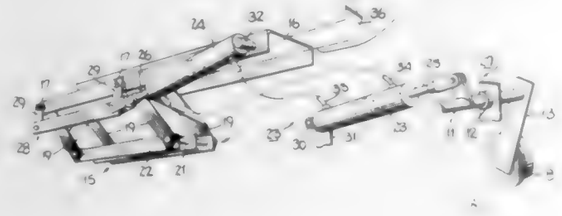
3,371,622
ARTICULATED CAR
Richard L. Lich, St. Louis, Mo., assignor to General Steel Industries, Inc., Granite City, Ill., a corporation of Delaware
Filed Oct. 18, 1965, Ser. No. 497,157
3 Claims. (Cl. 105—4)



An articulated railway car in which one underframe is supported near one of its ends on a truck and has transversely spaced upwardly facing hooks on that end, ver-

tical links suspended from said hooks, and a second underframe having downwardly facing hooks on its end adjacent the first underframe, the downwardly facing hooks being supported from said links and forming therewith the sole support of the adjacent end of the second underframe, and draft means comprising a drawbar pivoted to the second underframe on a horizontal axis and universally pivoted to the first underframe.

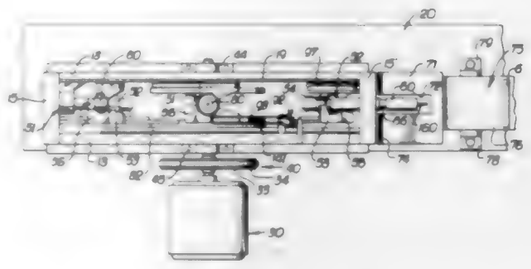
3,371,623
CONVERTIBLE RAIL-HIGHWAY VEHICLE WITH RETRACTABLE STEP
Francis W. Therrien, Whitehall, N.Y., assignor of forty-five percent to Raymond L. Therrien, Whitehall, and Carl A. Covell, Glens Falls, N.Y., in equal shares
Filed Oct. 21, 1965, Ser. No. 499,842
3 Claims. (Cl. 105—215)



Retractable step for a convertible rail and highway vehicle having means for riding on paved roadways and retractable means for riding on railway tracks, the latter including an arm on a rotatable shaft with a flanged guide wheel mounted thereon and movable between rail engagement and disengagement positions, the retractable step comprising a channel-shaped base secured to the underside of the vehicle and foldable within itself in the longitudinal direction of the vehicle, struts rotatably mounted on the channel-shaped base and linkage means interconnecting the retractable step and said arm including a pair of hydraulic cylinders each having a piston reciprocally movable therein, pivot means operatively connecting the piston of a first of said cylinders to the rotatable shaft for effecting reciprocal movement of said piston in said first of said cylinders, the piston of said second of said cylinders being connected by a pivot linkage to the struts for rotating the latter on said base, and a pair of flexible tubes interconnecting respective opposite ends of the hydraulic cylinders for transmitting hydraulic fluid therethrough from one cylinder to the other whereby movement of said first piston relative to said first cylinder causes an opposite movement of the other piston relative to the second hydraulic cylinder and causes positive retraction or extension of said step in consonance with movement of said flanged guide wheel.

3,371,624
APPARATUS FOR MAKING A TOROID
Daniel T. Thompson, 10584 Bradbury Road, Los Angeles, Calif. 90064
Filed Feb. 10, 1966, Ser. No. 526,474
15 Claims. (Cl. 107—8)

An apparatus for converting strips of pliant material, such as dough, into toroids by forming the strips between axially movable sleeve and mandrel assemblies mounted for concurrent rotation about a common axis wherein means are provided for feeding and positioning stationary strips of pliant material perpendicularly to and transversely across the path of travel of the rotating mandrels to cause successive strips to be picked up and carried along on successive mandrels, each strip picked up and carried by a mandrel being preformed into a generally U-shape about its associated mandrel due to the relative movement between the rotating mandrel and the positioned strip. Curling means are provided for curling the free ends of each preformed generally U-shaped strip of pliant material about the associated mandrel into overlapping curled contact, the strip ends overlapping rather than abutting, with each other prior to the strip being formed into a homogeneous toroid between the relatively movable associated mandrel and sleeve portions of the assemblies. The sleeve and mandrel assemblies are mounted for concurrent rotation about a generally horizontal axis in a generally vertical plane with a feeding station located adjacent one edge of the plane defined by the extremeties of the assemblies and at approximately the level of the axis of rotation thereof. A strip of material picked up at the feeding station in the zone generally level with the axis of rotation of the sleeve and mandrel assemblies is then carried by the mandrel successively into a curling zone, a forming zone and a discharge zone.

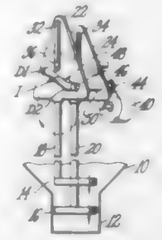


In the forming of the pliant strip of material into a toroid, means are provided for partially retracting each mandrel relative to its associated sleeve on picking up of a strip of material to pinch the bight portion of the preformed generally U-shaped strip between the mandrel and sleeve while the strip free ends are curled about the mandrel in overlapping relation in the curling zone. The curling assemblies may be mounted on each of the rotating sleeve or mandrel assemblies or may be mounted to the apparatus frame for operating upon mandrel assemblies as they pass thereby. In curling the ends of the pliant material into overlapping relation about the mandrel prior to its being formed into a toroid, a first withdrawal of the mandrel into the sleeve pinches the bight portion of the strip between the mandrel and sleeve to hold it in fixed position on the mandrel; after a first end is curled about the mandrel, a further withdrawal of the mandrel into the sleeve lowers the first curled end and allows curling of the second free end into an overlapping relation to allow forming of the thus overlapped free strip ends into a toroid configuration.

3,371,625
DOUGHNUT DROPPER WITH ADJUSTABLE SIZING MEANS
Stanley B. Jones, Torrance, Calif., assignor to Hol 'N One Donut & Supply Co., Los Angeles, Calif., a corporation of California
Filed July 15, 1966, Ser. No. 565,554
4 Claims. (Cl. 107—14)

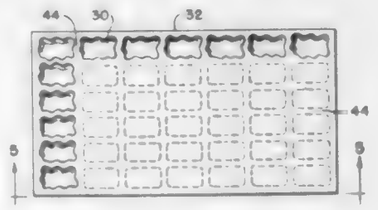
The invention provides a dough ring former (e.g. "doughnut dropper") having respective dough-ejector and dough ring-cutoff pistons and having dual piston-actuator cams driven by a rotating crank having a single eccentric pin extending through slots in the respective cams, the slots being of such relative configurations as to transmit a relatively short stroke to the ejector piston and a relatively long stroke to the cutoff piston so as to provide opening and closing relative movements between the pistons for drawing dough between them and for extruding such dough into a ring respectively. The configurations

of the cam slots are a straight transverse slot for the ejector piston actuator cam and a Z-shape slot for the cutoff piston actuator cam, such Z-slot having an intermediate incline which speeds up the movement of the cutoff piston ahead of that of the ejector piston during second and fourth quarters of the operational cycle, thus attaining the closing and opening relative movements of the pistons through the driving action of a single eccentric pin.



The invention further provides for stroke adjustment of the ejector piston actuator cam so as to vary the stroke of the ejector piston, thus to vary the size of the dough ring that is formed. This is accomplished by modifying the Z-shape of the slot in the ejector piston actuator cam.

3,371,626
CONFECTION MANUFACTURE
Samuel J. Hachtman, River Forest, Ill., assignor to Sugarless Candy Corporation of America, Chicago, Ill., a corporation of Illinois
Filed Sept. 14, 1965, Ser. No. 487,232
12 Claims. (Cl. 107—19)



Method of making sugarless candy from an aqueous solution of sorbitol by first heating to evaporate the water therefrom and after the water content has been reduced, allowing the waterfree candy mixture to cool at a temperature which is below its melting point but above the temperature at which it starts to set. The process is then continued by depositing measured quantities of the heated sorbitol into thin-wall cavities of a plastic mold, the housing and nozzles of the depositor having thermostatically controlled heating elements which maintain the temperature of the sorbitol above the temperature at which it sets but below a temperature at which the plastic mold cavities would heat-deform. The thin walls of the cavities in the plastic mold are of irregular contour and arranged in spaced complementing relation to the walls of adjacent cavities to provide surrounding channels which permit free circulation of air between the cavities and accommodate rapid cooling and setting of the sorbitol candy.

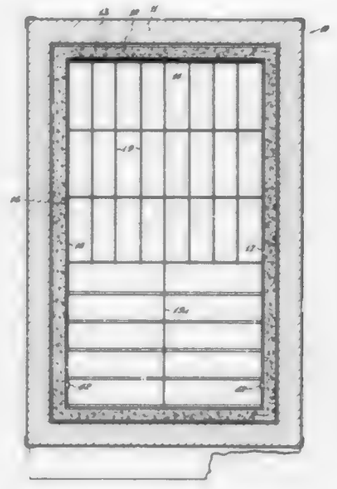
3,371,627
MODULAR INTERIOR STORAGE SAFE
Leland W. Belew, Hamilton, Ohio, assignor to The Mosler Safe Company, Hamilton, Ohio, a corporation of New York
Filed Aug. 26, 1966, Ser. No. 575,412
6 Claims. (Cl. 109—53)

1. For use in combination with a record safe of the type having fireproof walls and interior, a modular safe interior assembly adapted to be mounted inside said safe and suspended from adjacent the ceiling thereof, said interior assembly comprising

a pair of vertically extending side panels,

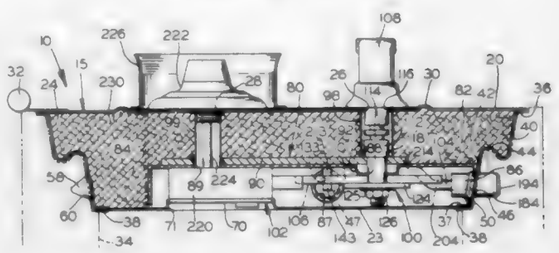
at least one vertical partition panel extending parallel to and between said side panels,

suspension members connected to the top of each of said partition and side panels and adapted to be secured in place adjacent the interior ceiling of said safe such that said side and partition panels hang downwardly from said suspension members, the bottom edges of said side and partition panels being spaced from the interior floor of said safe such that said panels are supported solely by said suspension members, and



transverse support bars extending between and supported solely by said side and partition panels, each support bar being adapted to support objects stored within the interior of said safe.

3,371,628
INSULATED CLOSURE CONSTRUCTIONS AND METHODS OF ASSEMBLY THEREOF
Ralph E. McClellan, Toledo, Ohio, assignor to Meilink Steel Safe Company, Toledo, Ohio, a corporation of Ohio
Filed June 6, 1966, Ser. No. 555,356
11 Claims. (Cl. 109—59)



1. An insulated closure comprising:

(A) an outer plate,

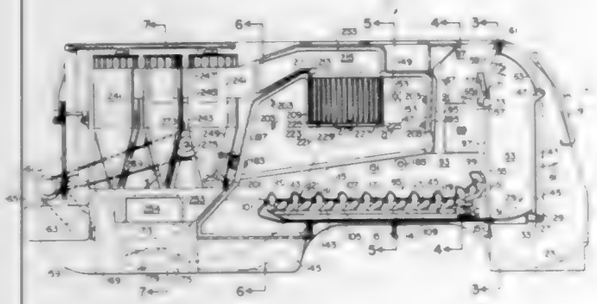
(B) a frame around the edge of said plate giving thickness to said closure having a first hole therein,

(C) a bolt work box having an open side flush with the inner edge of said frame, said box being spaced from said outer plate within the thickness of said closure and having a second hole therein aligned with said first hole,

(D) a tube extending between the peripheral edges of said first and second holes, and

(E) insulation means filling the space between said plate and said edge of said frame throughout the thickness of said closure including surrounding said tube and filling the space between said plate and said box.

3,371,629
MOBILE INCINERATOR
Richard B. Engdahl, Herbert R. Hazard, and Glen M. Hein, Columbus, Ohio, assignors to Battelle Memorial Institute, Columbus, Ohio, a corporation of Ohio
Filed Nov. 18, 1964, Ser. No. 412,211
3 Claims. (Cl. 110—8)



3. A mobile apparatus for the collection and incineration of refuse, comprising:

(a) a frame;

(b) a combustion chamber mounted on said frame;

(c) a grate positioned in said combustion chamber said grate being constructed to move refuse through said combustion chamber;

(d) means mounted on said frame for receiving refuse and transferring said refuse onto said grate;

(e) means for supplying sufficient heat to cause combustion of said refuse within said combustion chamber;

(f) a plenum chamber surrounding said combustion chamber;

(g) a plurality of louvers in the walls of said combustion chamber, said louvers providing communication from said plenum chamber to said combustion chamber;

(h) means for supplying air at superatmospheric pressure to said plenum chamber through said louvers and directionally along the inner surface of said combustion chamber whereby said air cools the combustion chamber wall and subsequently provides oxygen to burn the refuse;

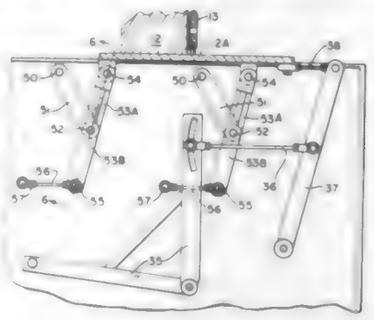
(i) a flue passage communicating with said combustion chamber;

(j) means including heat exchanger means for preventing unburned refuse from escaping into said flue; and

(k) separating means positioned in said flue passage for separating entrained ash particles from the flue gases.

3,371,630
BORDER PANEL MANUFACTURING MACHINE
James A. Cash, Jr., Louisville, Ky., assignor to DRC Corporation, Louisville, Ky., a corporation of Kentucky
Filed Feb. 25, 1966, Ser. No. 530,076
6 Claims. (Cl. 112—2)

An improved means for supporting a sewing machine head on an apparatus for manufacturing mattress border panels wherein a border panel fabric assembly is moved longitudinally through the manufacturing apparatus while the sewing machine is moved transversely back and forth over the longitudinal path of the border panel fabric assembly. The sewing machine head frame support comprises a pair of horizontally spaced linkage units coop-



eratively mounting the head frame on the apparatus base frame for back and forth translational movement along a flat substantially planar path.

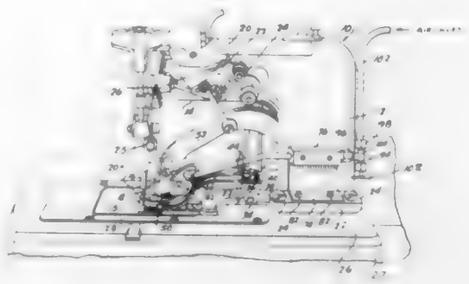
3,371,631
WORK-STACKING MECHANISM
John L. Rockerath, Utica, N.Y., assignor to Union Special Machine Company, Chicago, Ill., a corporation of Illinois
Filed Apr. 28, 1966, Ser. No. 546,026
15 Claims. (Cl. 112—2)

1. Apparatus for stacking relatively flat pieces of flexible material which comprises, means providing a supporting surface along which said pieces may be advanced, said means having an edge toward which said pieces are advanced, means for advancing successive pieces of said material toward said edge and into overhanging relationship to said edge, a stacking bar swingable in an arc below said supporting surface partly in a region beneath the latter and partly outwardly from said edge thereof, said bar being maintained in substantially parallel relation to said edge and carried through the region in which the overhanging portions of successive workpieces are disposed, clamping means at opposite sides of said bar and spring urged toward the latter, means for detaining said clamping means against any substantial movement beyond the path of the overhanging portions of the pieces opposite to the side on which they cooperate with said bar, and means for swinging said bar to engage and pick-up successive pieces of the material.

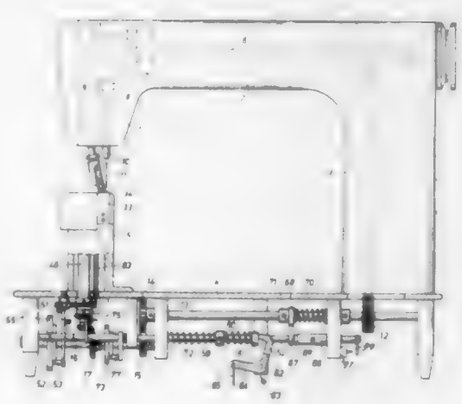
3,371,632
THREAD CONTROL ATTACHMENT FOR SEWING MACHINES
C. James Snyder, Camp Hill, Pa., and Gunther A. Hess, Camp Hill, Pa. (2245 Rudy Road, Harrisburg, Pa. 17104); said Snyder assignor to said Hess
Filed Dec. 17, 1965, Ser. No. 514,726
8 Claims. (Cl. 112—218)

A sewing machine attachment wherein air is employed to keep the starting end of the thread out of the path of

clamping arms or the like. The air is provided by a conduit connected at one end to a source of air under pressure and terminating at the other end in nozzle means positioned adjacent the sewing needle opening to direct air on opposite sides thereof.



3,371,633
THREAD CUTTING DEVICE FOR SEWING MACHINES
Kristen Hedegaard, Gentofte, Denmark, assignor to G. M. Pfaff AG, Kaiserslautern, Pfalz, Germany, a corporation of Germany
Filed Apr. 5, 1966, Ser. No. 540,252
Claims priority, application Germany, Apr. 7, 1965, P 36,471
9 Claims. (Cl. 112—252)



1. The combination with a sewing machine including a reciprocatory needle carrying a needle thread passing through an opening of said needle, a looptaker having an operative element carrying a looptaker thread passing through an opening of said element, said element having a predetermined operative position during the operation of said machine in producing a stitch in the work being operated on by cooperation of said needle with said looptaker, of thread-cutting apparatus comprising in combination:

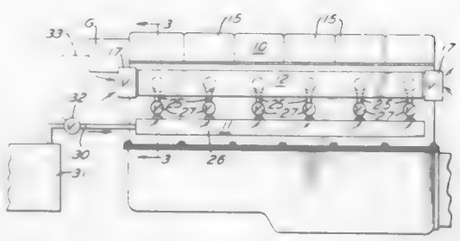
(1) a thread cutter including a pair of cutting elements and positioned normally in an inoperative retracted position,

(2) first operating mechanism to consecutively operate said cutter from said inoperative position to an operative thread-cutting position and to actuate said cutting elements upon arrival in said operative position,

(3) second operating mechanism including control means therefor to operate said looptaker element from said predetermined position to a retracted position, to extract a predetermined length of looptaker thread, and

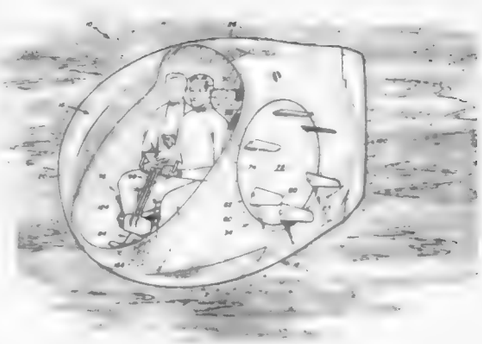
(4) coupling mechanism between said first and said second operating mechanism, to operate said cutter towards the thread being extracted and to seize and cut the extracted thread by said elements of said cutter upon the actuation of said control means.

3,371,634
APPARATUS FOR COMBUSTION CONTROL IN DIESEL ENGINES
John Clark Lalande, 173 W. 8th St., Oswego, N.Y. 13126
Filed Oct. 19, 1966, Ser. No. 587,720
4 Claims. (Cl. 123—198)



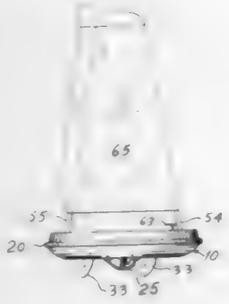
Combustion control apparatus for diesel engines which includes individual shut-off valves in each air intake manifold connection to each cylinder and may include a source of combustion inhibiting fluid connected to each air intake manifold connention and controlled by normally closed shut-off valves.

3,371,635
SUBMERSIBLE VESSEL
Leonard W. Seeley, China Lake, Calif., assignor of fifty percent to Nancy Lee Seeley, China, Lake, Calif.
Filed Sept. 7, 1966, Ser. No. 577,644
16 Claims. (Cl. 114—16)



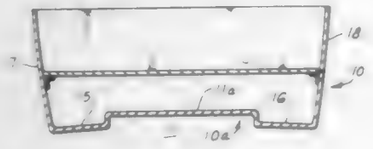
1. A submersible vessel, comprising, hull structure defining an ellipsoidal shape having its major transverse axis arranged vertically, pressure bulkhead means dividing said hull structure into a cockpit area and a flooded area for power, air ballast and environmental systems, a mid-hull twin cycloidal propeller propulsion system mounted on the starboard and port sides of said vessel for propulsion thereof, and means for controlling the operation of said propulsion system so as to control the maneuvering characteristics of said submersible vessel.

3,371,636
WATERBORNE VESSELS
David H. Sharp, 6 Linnet Crescent, Strathmore, Quebec, Canada
Filed July 12, 1965, Ser. No. 471,117
28 Claims. (Cl. 114—39)



A circularly hulled vessel in which triangularly arranged control-board means depend beneath the hull and substantially surround the center of the hull, and in which the control-board means can be simultaneously or independently operated during various conditions, and in which the vessel can be power or sail operated.

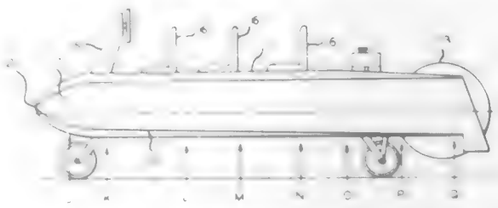
3,371,637
PADDLE WHEEL BOAT
James W. Woodall, Rte. 2, Box 235A–1, Angleton, Tex. 77515
Filed June 6, 1966, Ser. No. 555,416
5 Claims. (Cl. 114—58)



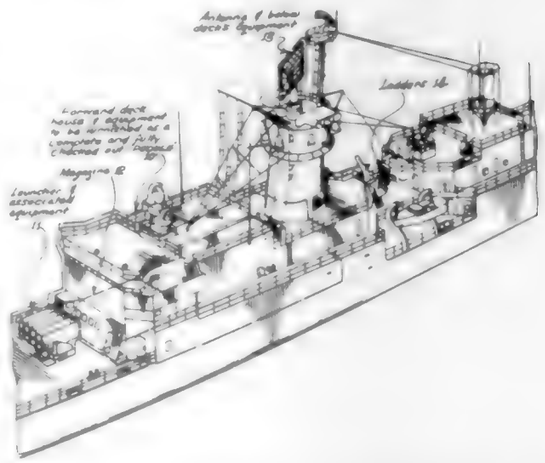
A boat is disclosed that is particularly adapted for use in shallow water. The boat is propelled by a paddle wheel mounted at the back of the boat. The paddles on the paddle wheel do not extend below the bottom of the boat so the depth of water in which the boat can operate is limited only by the amount of water the boat draws. To supply the paddle wheel with sufficient water for it to operate efficiently, a water tunnel extends longitudinally of the bottom of the boat to permit water to flow through the tunnel from the front of the boat to the paddle wheel. To further increase the water flowing through the tunnel to the paddle wheel, the bottom of the boat is inclined upwardly from the outboard edge of the hull to the water tunnel. This causes the water displaced by the hull, as the boat travels through the water, to tend to flow into the water tunnel rather than away from the boat.

3,371,638
HYDROFOILS
Anton A. Beringer, S. 7238 Lochcrest Blvd., Muskego, Wis. 53150
Filed Nov. 7, 1966, Ser. No. 592,377
4 Claims. (Cl. 114—66.5)

1. A hydrofoil for boats and the like including an elongated buoyant body having a tapered nose portion and shaped to provide a lifting action when traversing water, said body having recesses on each side thereof extending from a point near the nose portion of the body to a point at the end of said body, said recesses being inclined to the longitudinal axis of the body and extending in a downward direction from the forward portion of the body to the rearward portion thereof.

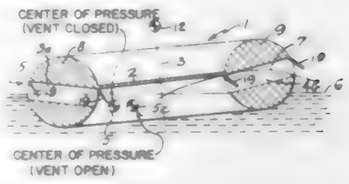


3,371,639
PODULE ASSEMBLY METHOD FOR SHIPS
George H. Schillreff, Glendora, Calif., assignor to General Dynamics Corporation, Pomona, Calif., a corporation of Delaware
Filed Nov. 29, 1966, Ser. No. 604,108
10 Claims. (Cl. 114—77)



A method of construction or modification of a ship wherein preassembled or prefabricated superstructure, such as that containing electronic gear for a missile weapon system, is bodily positioned on the deck. The preassembled superstructure is so constructed that the equipment therein is compatible for ready interconnection with electrical, hydraulic, water and other systems of the ship. The superstructure is then secured to the deck, and the ship is ready for operation.

3,371,640
MEANS AND METHOD OF DAMPING PITCHING AND ROLLING OF FLOATING STRUCTURES UNDER WAVE AND SWELL ACTION
Leo J. Tsokalas, 20 Gardner St., Manchester, Conn. 06040
Filed Oct. 6, 1966, Ser. No. 600,295
13 Claims. (Cl. 114—121)



1. A floating body having volume and weight, displacing water on which it is floating, said body provided with one or more vents each in the form of a straight longitudinal passage open at its opposite ends, both ends of all of said vents being disposed on the external surface

of said body above the normal water level and one of said ends of each vent disposed adjacent said water level when the water is calm, each of said vents located so as to extend longitudinally of the body solely in an outward direction away from its center of gravity and adapted to receive and permit passage of a portion of a wave moving from fore to aft and thus reduce the water displacement and buoyancy of the portion of the body provided with the vent or vents from what they would be with the full volume of the body without the vent or vents.

3,371,641
FOOT OPERABLE STEERING APPARATUS FOR BOATS AND MOTORS

Willis F. Rohman and Edwin R. Fredrick, both of P.O. Box 8192, Dawson Station, Tulsa, Okla. 74151

Continuation-in-part of application Ser. No. 416,276, Dec. 7, 1964. This application May 11, 1966, Ser. No. 549,201
9 Claims. (Cl. 114—153)

1. A foot operable steering attachment for an outboard motor comprising:
   - a bracket detachably securable to a guiding component of an outboard motor;
   - a normally horizontal extensible arm detachably secured at one end to said bracket;
   - a normally downwardly depending extensible arm pivotally mounted at one end thereof adjacent a second end of said horizontal arm; and
   - a stirrup detachably mounted to the lower end of said downwardly depending arm wherein movement in a horizontal direction of said stirrup imparts arcuate movement to said guiding component.

3,371,642
TRIM CONTROL DEVICE FOR BOATS

William M. Joy, 1615 N. River Road, St. Clair, Mich. 48079

Filed Oct. 15, 1965, Ser. No. 496,553
8 Claims. (Cl. 114—66.5)

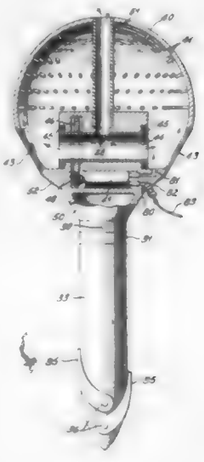
1. In an apparatus for stabilizing a boat having a hull which terminates at its stern end in an upwardly extending transom section,
   - a pair of flat rectangular shaped trim tab elements constructed of a relatively flexible material and having a first portion secured to the underside of the hull at the opposite ends of the transom section and a second portion extending rearwardly of the transom section and disposed in substantially coplanar relation with the underside of the hull,
   - a pair of actuating motors mounted on said transom section,
   - a pair of shafts aligned with said trim tab elements and extending through laterally spaced openings in said transom section,
   - drive means connected to said motors and adapted to move said shafts along the longitudinal axes thereof, and

   - a pair of actuating rods pivotably connected at their upper ends to said shafts and at their lower ends to the upper sides of said second portions of said trim tab elements,
   - energization of said motors being adapted to move said shafts longitudinally thereof whereby to vary the inclination of said second portions of said trim tab elements relative to the plane of the underside of the hull.

3,371,643
HYDRAULICALLY ACTUATED DRIVER

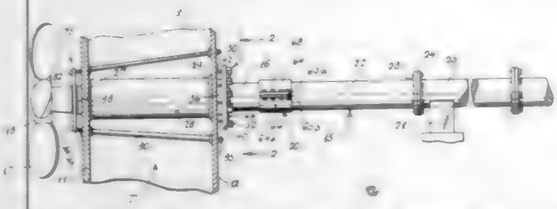
William Howard Dunham, 9911 Parkwood Drive, Bethesda, Md. 20014

Filed Aug. 6, 1962, Ser. No. 215,212
5 Claims. (Cl. 114—206)



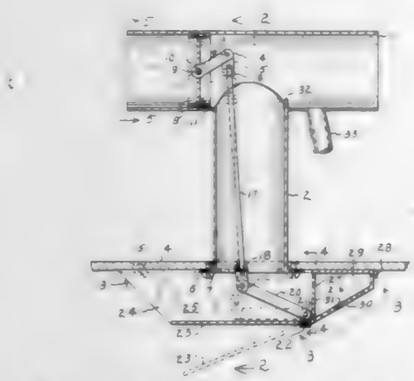
1. A marine anchor embedding apparatus comprising a fluid reservoir, having an inner surface and an outer surface, a plurality of protuberances mounted on said inner surface for creating turbulence in fluid flowing therein, a conduit extending into said reservoir, a rotatably mounted valve positioned in said conduit within said reservoir and intercommunicating said reservoir and said conduit, said valve comprising a hollow cylindrical body for changing the direction of flow of fluid through said conduit through an angle of substantially 90° and the inner surface of said reservoir changing the flow of fluid through substantially another 90°, means adapted to selectively rotate said valve from a position closing said conduit to a position permitting fluid to pass through said conduit, and a device mounted to the lower end of said reservoir.

3,371,644
PROPELLER DRIVE SHAFT AND BEARING ASSEMBLY
Oscar A. Yost, 302 W. 22nd St., New York, N.Y. 10011
Filed Oct. 13, 1966, Ser. No. 586,398
10 Claims. (Cl. 115—.5)



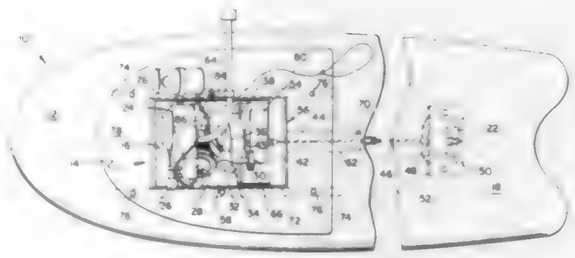
1. A propeller drive assembly for a ship having a hull, a bulkhead spaced from said hull and defining a tank therewith, and a rigid axially horizontal tube extending in a fore and aft direction and secured at opposite ends to said hull and bulkhead with openings in the hull and bulkhead respectively registering with opposite ends of the tube; said assembly comprising a cylindrical drive shaft section rotatably disposed in said tube and extending its rear end through the hull to support a propeller and extending at its forward end through the bulkhead for driving connection to an engine, a plurality of semi-cylindrical bearing plates disposed in said tube between the drive shaft section and said tube, said bearing plates being removable through a forward end of the tube and the opening in the bulkhead, and a gland assembly at the bulkhead adjustably secured thereto for sealing the shaft at said forward end of the tube, said gland assembly comprising a flat ring having circumferentially spaced holes, a plurality of studs mounted in said bulkhead and extending through said holes in the ring, first gear nuts mounted on the studs, and idler gear nuts rotatably supported by the ring and alternating with first named gear nuts, whereby turning any one gear nut rotates all gear nuts for advancing the ring axially to seal the shaft section to the opening in the bulkhead and for retracting the ring to release the sealing of the shaft section to the opening in the bulkhead.

3,371,645
DIRECTIONAL FLOW EXHAUST REGULATOR
Lyle O. Ward, 615 River St., Port Huron, Mich. 48060
Filed May 16, 1966, Ser. No. 550,393
9 Claims. (Cl. 115—.5)



A directional flow exhaust regulator for boats having an internal combustion engine and including a first conduit to exhaust gases into the atmosphere, a second conduit to exhaust gases under water, a valve disposed in said first conduit and having an open position to allow exhaust of gases from said first conduit and a closed position to force gases to exhaust from said second conduit, an actuator movable by water flow to close said valve and movable in the absence of water flow to open said valve, and means interconnecting said valve and said actuator. Said second conduit opens into an exhaust chamber, which has a wall in common with a pressure chamber, said common wall being formed with a small plurality of holes, and the forward wall of said pressure chamber being formed with a larger plurality of holes, so that as the boat moves through water, water is forced into said chamber through the larger plurality of holes at a rate greater than it can escape through the smaller plurality of holes causing a jet-like stream of water to help clear exhaust gases from the exhaust chamber.

3,371,646
POWERED WATERCRAFT
Richard L. Mela, Arlington, Mass., assignor to The Powermite Corporation, Arlington, Mass.
Filed July 27, 1966, Ser. No. 568,307
16 Claims. (Cl. 115—70)



A power unit is attached to a solid foam hull to provide a powered floatboard. The floatboard supports a passenger who controls its speed and direction.

3,371,647
ATHLETIC FIELD MARKER
Irwin B. Shopbell, 5409 Beverly Ave. NE., Canton, Ohio 44714
Filed July 12, 1966, Ser. No. 564,608
3 Claims. (Cl. 116—114)

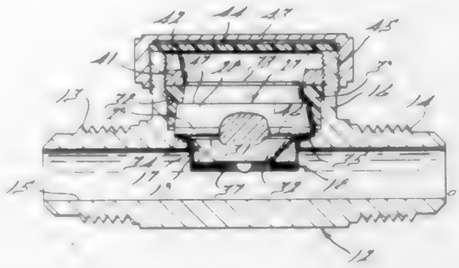
A corner marker for football fields and the like comprising a pliable, flexible post of foam-rubber-like material such as polyethylene foam having an impervious

covering such as vinyl bonded to its outer surface. A rubber base plate is bonded to the lower end of the post and has a depending plug inserted into a socket in the ground.

3,371,648
LIQUID INDICATOR

Frank J. Farina, Jr., Port Huron, Mich., assignor to Mueller Brass Co., Port Huron, Mich., a corporation of Michigan

Filed Mar. 24, 1966, Ser. No. 537,182
5 Claims. (Cl. 116—117)

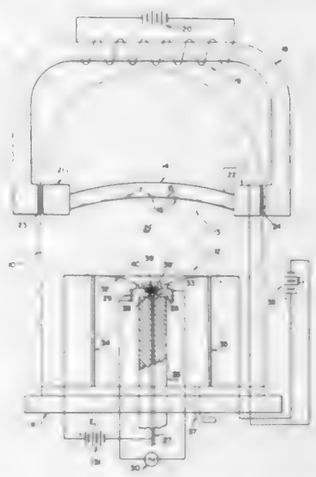


A liquid indicator for refrigerant lines to indicate the absence of liquid and whether there is water present. The indicator has a sight glass with a slightly conical sealing portion and a frustoconical sight portion coacting with an annular indicator.

3,371,649
MEANS FOR CONTROLLED DEPOSITION AND GROWTH OF POLYCRYSTALLINE FILMS IN A VACUUM

Hammond E. T. Gowen, Escondido, Calif., assignor to Technical Industries Incorporated, Burbank, Calif., a corporation of California

Application Nov. 16, 1965, Ser. No. 511,285, which is a continuation of application Ser. No. 58,144, Sept. 23, 1960, now Patent No. 3,290,567, dated Dec. 6, 1966. Divided and this application Sept. 9, 1966, Ser. No. 578,290
10 Claims. (Cl. 118—49.1)

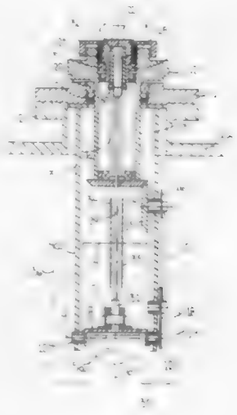


1. Apparatus for the deposition of a thin film on a substrate within a vacuum chamber, comprising: a source of material to be deposited on said substrate; heating means and an ionizing element adjacent said source of material for converting said source material into a plasma having an ionized state; a first source of direct current connected between said ionizing element and said source of material, and having a potential between the first and second ionization levels of said material and having an appropriate polarity to cause vaporized atoms of said material to be ionized to the first ionization level; conductive charging means spaced from said ionizing element and beyond said substrate; a second source of direct current connected between said conductive charging means and said ionizing element, and having a polarity which will attract the ions from said ionizing means toward said charging means whereby said substrate will collect at least a portion of the attracted ions; and a magnetostatic field generating means for causing magnetic lines of flux to be disposed at said substrate for causing deposited atoms of said material to crystallize in a preferred orientation with respect to each other and said substrate.

3,371,650
MEANS TO POSITION AND DRIVE WORK SUPPORT

Siegfried Böhler, Balzers, Heiligwies, Liechtenstein, assignor to The Bendix Corporation, Rochester, N.Y., a corporation of Delaware

Filed Dec. 27, 1966, Ser. No. 605,056
Claims priority, application Switzerland, Dec. 31, 1965, 18,168/65
4 Claims. (Cl. 118—503)



The adjusting apparatus according to the invention is for the remote adjustment of the spatial location of an object or part to be treated in an unaccessible location as in a vacuum chamber. The apparatus includes a carrier plate for the object or part to be treated which is rotatable about two different axes and is characterized by a flexible shaft which is provided for the transfer of the rotary motion about a first axis perpendicular to the carrier plate and a drive mechanism for pivoting the carrier plate into an arbitrary inclined position about a second axis perpendicular to the first axis. One end of the flexible cable is mounted to move freely in the longitudinal direction, either in an axial hole in a drive shaft or in the carrier plate.

A preferred form of performing the invention is provided in which the flexible shaft is led between two guide plates and the carrier plate is made plate-shaped and is mounted in bearings in a frame swingable about an axis parallel to the plane of the plate and which is connected to drive means for the adjustment of the inclined location of the frame.

3,371,651
FLUID APPLICATOR APPARATUS

Sigurd W. Johnson, Pennington, N.J., and Marvin A. Leedom, Warminster, Pa., assignors to Radio Corporation of America, a corporation of Delaware

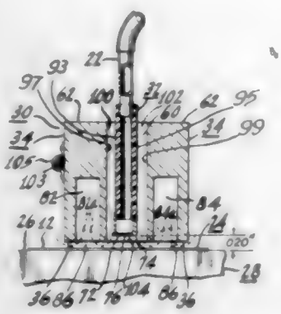
Filed Nov. 10, 1966, Ser. No. 593,494
17 Claims. (Cl. 118—637)

4. Apparatus adapted for relative motion with respect to a surface for applying a liquid to said surface, said apparatus comprising:

an applicator head having liquid supply conduit means for bringing said liquid into contact with said surface,

gas conduit means vented to the gas of the atmosphere,

liquid removal conduit means, spaced by said gas conduit means from said liquid supply conduit means, for conducting excess liquid away from said surface, and



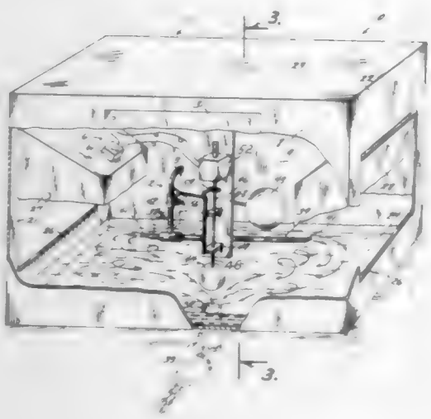
means cooperatively associated with said head to maintain said head a predetermined fixed distance from said surface with said relative motion between said surface and said head, said liquid removal conduit means comprising means to communicate with means for reducing the gas pressure within said liquid removal conduit means below that of said atmosphere, whereby said gas from said atmosphere flows into said liquid removal conduit means, carrying said excess liquid with it.

3,371,652

LIVESTOCK AUTOMATIC WATERING DEVICE

Robert A. Louks, Gilman, Iowa 50106, and Vernon H. Sietmann, Laurel, Iowa 50141

Filed June 8, 1966, Ser. No. 556,132
8 Claims. (Cl. 119—51.11)



1. An animal watering device comprising in combination:

a tank from which animals can drink, said tank having a wall and a floor, said floor having a drain outlet formed therein;

means for supplying water to said tank, said water supplying means including a nozzle for discharging water therefrom, said nozzle being spaced adjacent said wall and constituting a means for discharging the water against said wall and rebounding the water in a whirlpool manner, setting up a whirlpool scouring action and effectively suspending foreign matter in the water contained in said tank;

valve means disposed in said tank and movable from a first position wherein said outlet is closed to a second position wherein said outlet is open thus allowing the water and debris in said tank to be drained therefrom concurrently with said scouring action; and

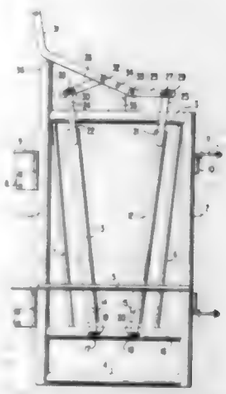
control means connected to said valve means and operable to move said valve means from the first position to the second position.

3,371,653

ANIMAL HEADGATE

John R. Anderson, Rte. 1, Bogata, Tex. 75417

Filed Aug. 29, 1966, Ser. No. 575,712
9 Claims. (Cl. 119—98)



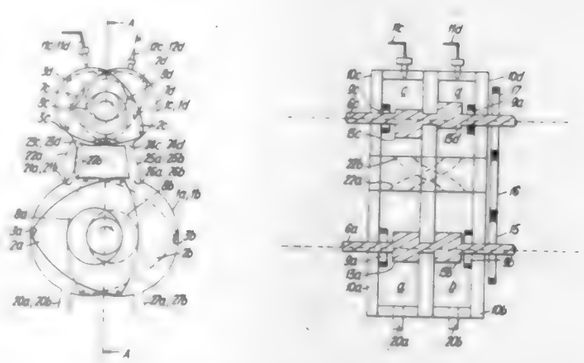
The present disclosure relates to an animal headgate which can be used as a stationary gate or as a portable gate which can be readily transported from one location to another. More particularly, the present disclosure is directed to an animal headgate which is provided with an opening-closing mechanism which cooperates with the gate frame to limit the opening movement of stanchion bars in one position and the closing movement of stanchion bars in a second position.

3,371,654

COMPOUND ROTARY PISTON TYPE INTERNAL COMBUSTION ENGINE

David Walker Garside, Sandbach, England, assignor to Rolls-Royce Limited, Derby, England, a British company

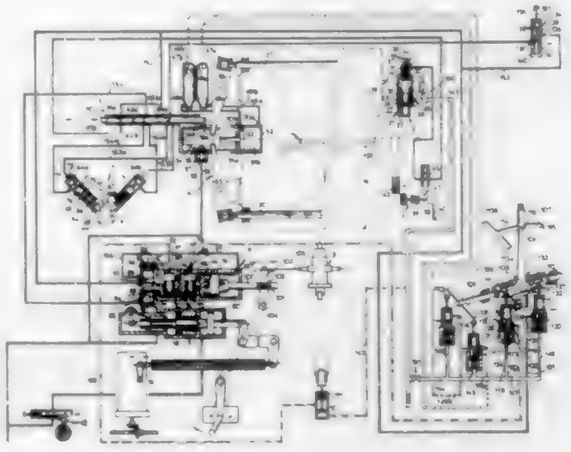
Filed Oct. 31, 1966, Ser. No. 590,710
Claims priority, application Great Britain, Nov. 13, 1965, 48,299/65
6 Claims. (Cl. 123—8)



1. A compound rotary piston internal combustion engine comprising four juxtaposed rotary piston units each including a casing having a two-lobed substantially epi-

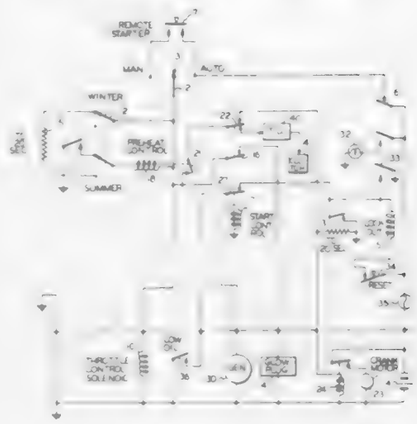
trochoidal inner peripheral surface, a rotary shaft, an eccentric mounted on the rotary shaft, a three-sided rotary piston arranged to rotate in a planetary fashion about the eccentric within the two-lobed casing and gearing to constrain the rotary piston to rotate at one third of the speed of the rotary shaft, the first and second units being of equal size but larger than the third and fourth units which are also of equal size; and further gearing to constrain the rotary pistons of all four units to rotate at the same speed; the arrangement being such that gas is drawn into the engine by the first rotary piston unit, is then initially compressed between the rotary pistons of the first and fourth units and their respective casings, is then further compressed in the fourth unit and, after combustion has been initiated, is then expanded by the rotary piston of the fourth unit and is then further expanded between the rotary pistons of the fourth and second units and their respective casings before being exhausted to atmosphere by the rotary piston of the second unit, and further, that gas is drawn into the engine by the second rotary piston unit, is then initially compressed between the rotary pistons of the second and third units and their respective casings, is then further compressed in the third unit and, after combustion has been initiated, is then expanded by the rotary piston of the third unit and is then further expanded between the rotary pistons of the third and first units and their respective casings before being exhausted to atmosphere by the rotary piston of the first unit.

3,371,655
SAFETY SYSTEM FOR SPEED REVERSAL IN HEAT ENGINES AND THE LIKE
Karl Kühn, Saint-Germain-en-Laye, France, assignor to Societe d'Etudes de Machines Thermiques, Saint-Denis, France, a body corporate of France
Filed Dec. 8, 1965, Ser. No. 512,417
Claims priority, application France, Dec. 10, 1964, 998,288
8 Claims. (Cl. 123—41)



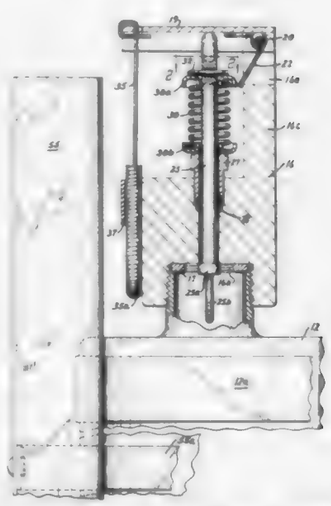
A safety system for speed reversal in heat engines fed by a fuel pump and having a speed reversing apparatus and a main control station. The means for preventing the admission of fuel and of air adapted to stop the engine during the speed reversing operation comprise in particular a one-block unit controlling the fuel pump and enclosing three chambers arranged in succession and forming slideway for slide valves respectively responsive to three separated devices of the system, i.e. means for detecting the direction of rotation of the engine, a stopping valve provided in the main control station and an electrically-controlled safety valve circuit.

3,371,656
SUMMER-WINTER AUTOMATIC DIESEL STARTING CONTROL
Norman M. Stauffer, New Holland, and Elam M. Stauffer, Ephrata, Pa., assignors to Stauffer Diesel Refrigeration, Inc., Gordonville, Pa., a corporation of Pennsylvania
Filed Apr. 14, 1967, Ser. No. 630,983
6 Claims. (Cl. 123—179)



An electrical control system for starting diesel motors automatically is disclosed. There are provisions for cranking the motor while energizing glow plugs from either manual or automatic control positions in either summer or winter hookups. A winter pre-heat condition occurring for some twenty seconds before cranking can occur is bypassed for summer operation. Cranking is terminated when the generator voltage is sufficient to lock out the start controls. Safety provisions are made to lock out the starter circuits if not started after a time delay of twenty seconds or so and to prevent starting if the oil is low. The lock out circuit may be reset for another starting cycle after it locks out, and without lock out it will recycle automatically and restart the motor should it stop when in automatic control.

3,371,657
ENGINE ACCESSORY
William J. Buchser, Posey County, Ind. (Norman Road, R.R. 1, Box 327K, Evansville, Ind. 47712)
Filed Jan. 27, 1965, Ser. No. 428,370
1 Claim. (Cl. 123—187.5)



An engine accessory for assisting the starting operation characterized by a replaceable pressurized fuel tank having valve means controlling the flow of fuel and, in combination therewith, an independent control mechanism

removably secured to such tank to define a dispenser unit, where such unit is mounted proximate the engine and where control is achieved remote from such unit in the area of the operator.

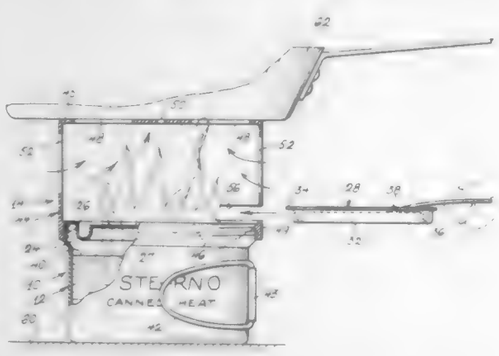
3,371,658
PRIMING METHOD AND ARRANGEMENT FOR FUEL FEED SYSTEM
Robert K. Turner, Toledo, Ohio, assignor to The Tillotson Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Filed Mar. 17, 1966, Ser. No. 535,203
11 Claims. (Cl. 123—187.5)

This invention relates to a priming method and arrangement for an aspirated type of diaphragm carburetor wherein the diaphragm controls a fuel inlet valve and an actuable member is provided to move the diaphragm to open the inlet valve and a manual priming pump actuated to purge the fuel line of air and fill the fuel chamber with fuel from a supply and establish fuel pressure in the fuel chamber sufficient to release the member from engagement with the diaphragm.

ERRATUM

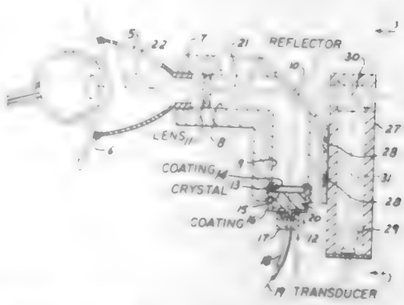
For Class 123—198 see:
Patent No. 3,371,634

3,371,659
THROW-AWAY PORTABLE STOVE
Tom S. Paspalas, 34 Mt. Vernon Ave., Bloomfield, N.J. 07003
Filed Sept. 14, 1966, Ser. No. 579,236
6 Claims. (Cl. 126—43)



A throw-away stove having a portable stove unit with a container of solidified fuel inside a ventilated housing. The container is removable from the housing and when inverted is adapted to support the housing which in turn is adapted to support a cooking vessel.

3,371,660
EQUIPMENT FOR USE IN ULTRASONIC EYE EXAMINATION
Benson Carlin, Princeton, N.J., assignor to Air-Shields, Inc., Hatboro, Pa., a corporation of Delaware
Continuation-in-part of application Ser. No. 447,419, Apr. 12, 1965. This application Sept. 1, 1966, Ser. No. 576,723
14 Claims. (Cl. 128—2)



Equipment for use in ultrasonic eye examination including a device having angularly aranged bores, with a transparent ultrasonic wave reflector at the junction of the bores, providing for concurrent visual and ultrasonic eye examination.

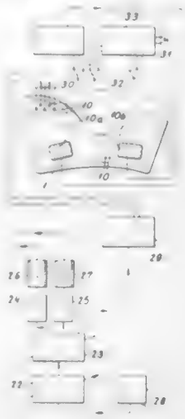
3,371,661
SPHYGMOMANOMETER
Carl A. Budde, 1303 Grandview, Glendale, Calif. 91201
Filed Feb. 24, 1965, Ser. No. 434,798
8 Claims. (Cl. 128—2.05)

Apparatus is disclosed herein for sensing and measuring fluid pulses under pressure in a duct including a transducer for generating an electrical analog signal which is proportionate to the pressure in the duct and a storage means coupled to the transducer for receiving and holding the analog signal. Electrical means are provided for developing a control signal in response to each fluid pulse and being operatively coupled to the storage means to selectively release the analog signal in response to the control signal.

3,371,662
DEVICE FOR AUTOMATICALLY EFFECTING CARDIAC MASSAGE
József Heid, József Hajós and József Seregi, Budapest, Hungary, assignors to Villamos Automatika Intezet, Budapest, Hungary
Filed Jan. 17, 1966, Ser. No. 521,006
6 Claims. (Cl. 128—24.5)

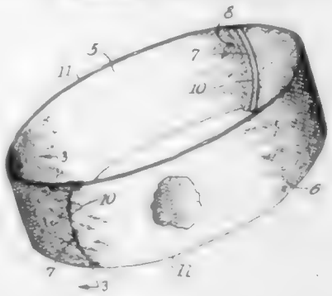
A device for automatically effecting cardiac massage, comprises a two-walled flexible chamber adapted to be secured on the heart in such a manner as to surround

the heart. The device is elastic and is provided between the walls with closed cavities adapted to communicate with apparatus for supplying to and withdrawing from the



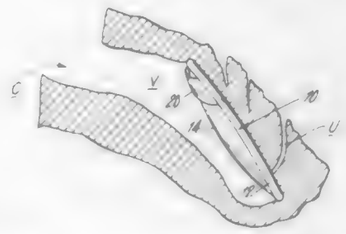
cavities a fluid pressure medium at the desired heart rhythm. The device also has stimulating defibrillating electrodes arranged in a wall of the device to conduct the action potentials of the heart into the apparatus.

3,371,663
ARM SLING
Martha M. Apgar, 4812 Briggs Ave., La Crescenta, Calif. 91014
Filed July 6, 1965, Ser. No. 469,587
4 Claims. (Cl. 128—94)



An arm sling made of two double layer lengths of stretchable fabric arranged on a bias having convexly curved ends with elastic stitching connecting the ends to form concavities into which fit an elbow and an opposite shoulder when the sling is worn.

3,371,664
DIAPHRAGM
Norman Pleshette, 21 E. 87th St., New York, N.Y. 10028
Filed Oct. 21, 1965, Ser. No. 500,104
1 Claim. (Cl. 128—127)



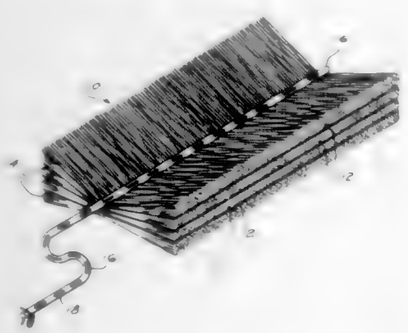
An intravaginal diaphragm having a circular peripheral frame providing the operative shape to the device and a removal band connected to extend across the perimeter of the frame and adjacent thereto so as to produce an optimum change in said operative shape to facilitate removal of the diaphragm.

3,371,665
DISPOSABLE VAGINAL SYRINGE
Madeline M. Druckenmiller, Saylorsburg, Gladys Elaine Bateman, Nazareth, and Joseph John Hauck, Walnutport, Pa., assignors, by direct and mesne assignments, to Eve's Associates, Inc., Bath, Pa., a corporation of Pennsylvania
Filed Mar. 16, 1966, Ser. No. 534,723
4 Claims. (Cl. 128—227)

1. A disposable vaginal syringe comprising:
(A) a flat bag having its walls formed of highly flexible and foldable plastic sheet material which is substantially chemically inert to body fluids and douche liquids and providing an expandable liquid storage chamber having a filling opening at its top end and a delivery opening at its bottom end, and
(B) a flat, foldable and elongated delivery tube of similar plastic sheet material connected at its top receiving end to the bag walls in liquid-tight manner about the bag delivery opening with such tube being of a certain dimensional width when in flat condition and having an initially open delivery end, and
(C) a spray nozzle in the form of an elongated, thin-walled and substantially form maintaining hollow shell of plastic substantially chemically inert to such liquids and fluids having a closed tip end and a substantially cylindrical hollow neck of certain internal diameter with its sidewall provided with a plurality of jet outlet openings, characterized by
(a) an elongated, substantially tubular and substantially form maintaining anchorage sleeve of plastic substantially chemically inert to such liquids and fluids and provided with a lengthwise split extending from end to end thereof with opposed edges on opposite sides of the split being appreciably spaced when said sleeve is unconfined, said unconfined split sleeve being of an outer diameter at least no less than the internal diameter of said nozzle neck and appreciably less than the internal diameter of the delivery end of said tube when expanded to substantially tubular form with the spacing of the opposed split edges being sufficient to permit transverse contraction of said sleeve to a diameter less than said neck internal diameter and with said transversely contracted sleeve having an elastic recovery sufficient to cause it to expand transversely when freed substantially back to its unconfined outer diameter,
(b) at least a longitudinal section of said split sleeve of appreciable length being inserted into the open delivery end of said tube with a side fold of the latter of appreciable width lapped back about an arcuate section of said sleeve whereby the outer side of said longitudinal sec-

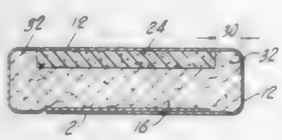
tion of said sleeve is completely encompassed by the sheet material of said tube, the longitudinal section of said sleeve in contracted condition and the encompassing tube sheet material being inserted in said tubular neck and released to expanded snugness in the latter with the tube sidewall and its lapped side fold intervening and securely clamped between said sleeve and the inside wall of said nozzle neck in a liquid-tight manner.

3,371,666
ABSORBENT DEVICE
Albert W. Lewing, Monson, Mass., assignor to Tampax Incorporated, New York, N.Y.
Filed Jan. 26, 1965, Ser. No. 428,025
23 Claims. (Cl. 128—285)



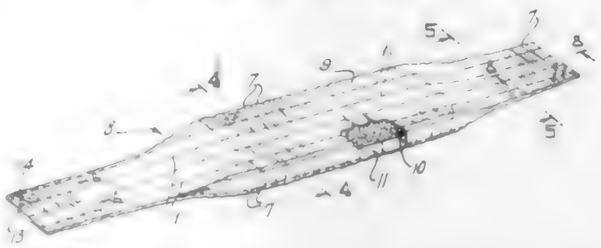
Apparatus and method having improved liquid absorption and retention properties, particularly useful as catamenial tampons, where typically a pad of cotton has water soluble, non-fibrous, carboxymethyl cellulose (CMC) having a degree of substitution above 0.35 dispersed within the pad in conjunction with an agglomeration-inhibiting means. The agglomeration inhibiting being accomplished by granulations, thin films, or the like, which maximize the total effective CMC surface exposed for absorption.

3,371,667
ARTICLE FOR ABSORBING BODY EXUDATES
Edward A. Morse, Fanwood, N.J., assignor to Johnson & Johnson, a corporation of New Jersey
Filed June 11, 1964, Ser. No. 374,487
3 Claims. (Cl. 128—290)



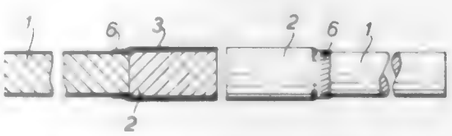
This application discloses absorbent products which include a functional, highly porous resilient element immediately adjacent the surface of the absorbent product which is to be placed against the body and which element serves to entrap highly viscous, mucoid and gelatinous constituents of the body fluids. The open structured, porous element has interstitial wall surfaces which are wettable so as to permit the fluid, low viscosity portion of body exudates to pass rapidly therethrough. Because of its porous open structured nature, the element serves to break up the low viscosity constituents of body exudates and by sheer forces exerted thereon during use render them more fluid so as to pass through the porous element and be absorbed by an absorbent core adjacent to the element.

3,371,668
SANITARY NAPKIN
Robert Wood Johnson, Princeton, N.J., assignor to Johnson & Johnson, a corporation of New Jersey
Filed Apr. 14, 1965, Ser. No. 448,060
5 Claims. (Cl. 128—290)



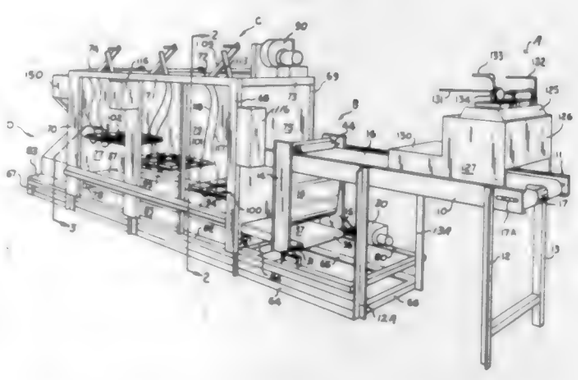
A nonwoven cover for a sanitary napkin where said cover is characterized by elasticity induced by tension-bonded strands of elastomeric material providing resultant improved comfort features.

3,371,669
MANUFACTURE OF MOUTHPIECE CIGARETTES
Desmond Walter Molins, Deptford, London, England, assignor to The Molins Organisation Limited, London, England, a corporation of Great Britain
Filed Jan. 19, 1965, Ser. No. 426,605
Claims priority, application Great Britain, Feb. 11, 1964, 5,682/64
5 Claims. (Cl. 131—94)



A method and machine for producing mouthpiece cigarettes, in which a uniting band is rolled around a mouthpiece and a cigarette length abutted and axially aligned therewith, provides for slitting at least one edge portion of the band prior to rolling so that said edge portion leaves a succession of tongues. During rolling said tongues may adjust their positions so as to provide an improved seal between the mouthpiece and the cigarette length.

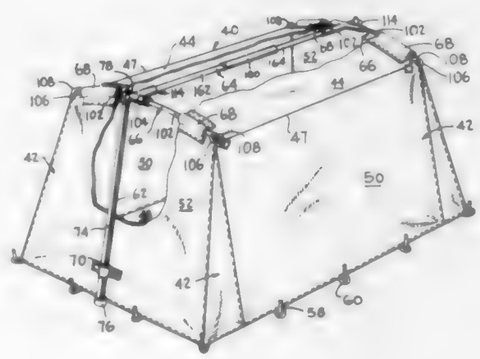
3,371,670
APPARATUS FOR CURING TOBACCO
Carl R. Camenisch, U.S. 42, Prospect, Ky. 40059
Filed Apr. 18, 1966, Ser. No. 543,128
7 Claims. (Cl. 131—121)



1. Apparatus for curing tobacco leaves detached from the stalk comprising, means for mechanically extracting moisture from the stems of the leaves, conveyor means having a generally horizontal portion for carrying the

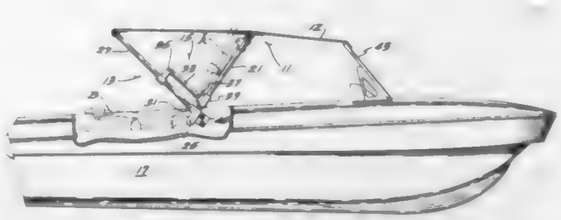
leaves to said moisture extracting means and a downwardly directed portion for carrying the leaves therefrom, a heated curing compartment, and means for moving the leaves through said compartment following their removal from said moisture extracting means and from contact with said conveyor means.

3,371,671
TENTS AND METHODS OF ERECTION
Arthur J. Kirkham, 5534 Avalon Drive, Murray, Utah 84107
Filed Oct. 23, 1965, Ser. No. 503,079
16 Claims. (Cl. 135—1)



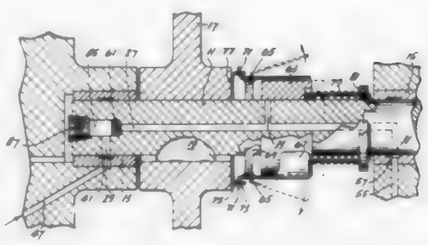
A tent construction having support structure comprising a ground-engaging, upright member to support the tent covering material upwardly and a sectioned ridge member, attached at one end to the upper end of the ground-engaging member, to urge the covering in an outward generally horizontal direction, and an elongated resilient member anchored at both ends to the tent covering material, coupled near its center to other of the support structure at or near the attachment between the upright and ridge members and having a length substantially greater than the straight line distance between anchor positions to urge the covering material both outwardly and upwardly into a taut condition responsive to placing the ridge sections in the fully erect position; novel clamp structure for telescopic tent poles; and methods of erecting tent constructions of the general type mentioned.

3,371,672
CONVERTIBLE TOP
Gordon B. Hale and Lars E. Granholm, Waukegan, Ill., assignors to Outboard Marine Corporation, Waukegan, Ill., a corporation of Delaware
Filed May 31, 1966, Ser No. 553,985
9 Claims. (Cl. 135—6)



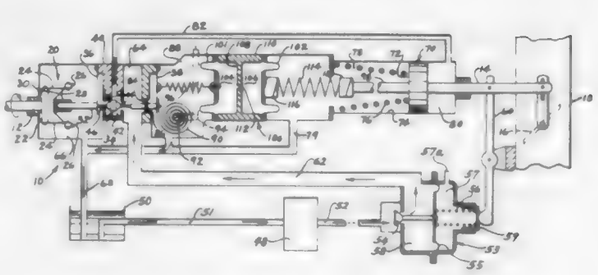
Disclosed herein is a convertible top for a boat including a first link pivotally connected to a boat hull, a second link pivotally connected to the first link and means movable lengthwise of said first link and connected to said second link and acting over-center for establishing the soft top in erected condition.

3,371,673
HYDRAULIC SPEED GOVERNOR CONTROL
Robert L. Trapp, Milwaukee, Wis., assignor to Outboard Marine Corporation, Waukegan, Ill., a corporation of Delaware
Filed Oct. 14, 1964, Ser. No. 403,728
5 Claims. (Cl. 137—34)



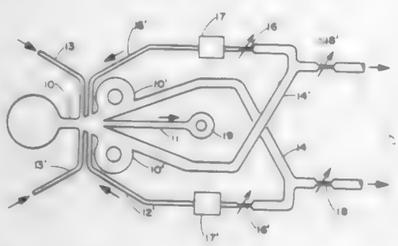
Disclosed herein is an output shaft overspeed governor which is connected to a fluid pressure sensing fuel control device operable to control the rate of rotation of the shaft and which is operable, in response to rotation of the shaft above a predetermined speed, to open a valve so as to dump fluid pressure oil whereby to affect the fluid pressure sensing fuel control device to cause a reduction in engine speed.

3,371,674
FLUID GOVERNOR OR CONTROLLER
Robert H. Thorner, 8750 W. Chicago Blvd., Office F, Detroit, Mich. 48204
Continuation-in-part of application Ser. No. 463,319, June 11, 1965. This application April 1, 1966, Ser. No. 539,358
12 Claims. (Cl. 137—36)



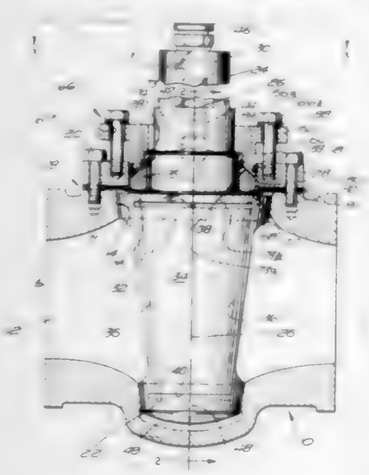
1. In a self-regulating control mechanism for automatically controlling a variable condition the combination of, control means to regulate said controlled condition, a pressure responsive member operatively connected to said control means for actuation thereof, a fluid circuit having a source of pressure fluid to produce a flow of fluid therethrough and communicating with said pressure responsive member, valve means in said circuit for controlling pressure therein acting on said pressure responsive member for effecting regulating movements thereof, sensing means responsive to changes in the controlled condition to produce forces varying as a function thereof and acting on said valve means to effect movements thereof for causing said controlled-condition-regulating movements of said pressure responsive member and said control means, and pressure-controlling means including pressure regulator means operatively associated with said control means to vary the magnitude of said source-pressure as a function of the movement of said control means and tending to correspondingly vary said pressure controlled by said valve means in a direction tending to reverse the movement of said pressure responsive member and said control means.

3,371,675
FLUID AMPLIFIER
Richard W. Hatch, Jr., Norwell, Mass., assignor to The Foxboro Company, Foxboro, Mass., a corporation of Massachusetts
Filed June 24, 1964, Ser. No. 377,647
1 Claim. (Cl. 137—81.5)



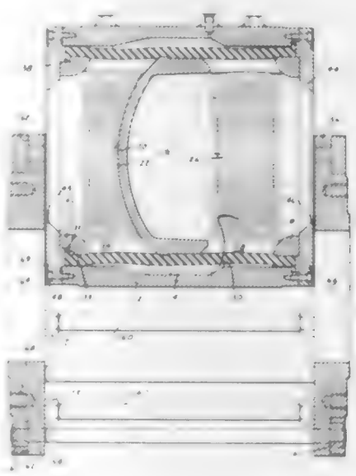
1. A fluid amplifier integral device comprising a main fluid input passage, two output passages branching from said main passage, a side wall exhaust setback and clearance recess in each of said output passages whereby ordinary bi-stable action is avoided in that no output passage wall section is provided for the fluid flow to cling to, a single central exhaust passage open to said main fluid input passage and located between said two output passages, a pair of initial signal passages as opposing control inputs to said device whereby fluid flow from said main flow input will be divided between said output passages according to the signal differential in said control input passages without flow lock-up in either of said output passages, a pair of feedback signal opposing control inputs to said device, crossover feedback passages from said output passages to said feedback control inputs, a series combination of fluid resistance and fluid capacity means in each of said crossover feedback passages, an output take-off passage from each of said crossover feedback passages, and fluid resistance means in each of said output take-off passages, whereby a feedback differential signal is applied to said device in the same proportion and direction as the initial signal differential, in such manner as to maintain the output differential as a memory of the initial signal differential.

3,371,676
LUBRICATED PLUG VALVE WITH ADJUSTABLE UNIFORM SEALING PRESSURE GLAND
John J. Mullaney III, Warwick, R.I., assignor to Grinnell Corporation, Providence, R.I., a corporation of Delaware
Filed June 18, 1965, Ser No. 465,065
25 Claims. (Cl. 137—246.19)



A lubricated plug valve construction having a tapered plug with the stem extending from the large end thereof through an aperture in the cover, with a flexible sealing member secured between the cover and body and overlying the large end of the plug around the stem and with a gland around the stem exerting sealing pressure on the sealing member, in which construction the gland includes a ball joint arrangement for maintaining adjustable uniform sealing pressure against sealing member even when the gland is tilted.

3,371,677
FLUID FLOW CONTROL DEVICE
Walter L. Connolly, Orinda, Calif., assignor to Grove Valve and Regulator Company, Oakland, Calif., a corporation of California
Filed July 2, 1964, Ser. No. 379,805
5 Claims. (Cl. 137—315)

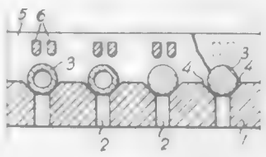


3. A valve structure comprising:
a tubular main valve body band,
a sleeve-like core having two axially spaced annular series of through slots around it mounted in radially spaced relationship within said main body band,
a barrier across said core between said spaced series of slots blocking direct flow through said core,
an expansible sleeve on said core,
an inlet connector plate having an inlet passage therethrough,
means on said inlet connector plate for attaching it to a pipe section,
an outlet connector plate,
means forming an outlet flow passage of selected internal diameter through said outlet connector plate
means on said outlet connector plate for connecting it to a pipe section of selected diameter,
a plurality of threaded members around said connector plates for forcing them into clamping engagement with said valve body band, means on said body band spacing said expansible sleeve from said connector plates, and
resilient seal rings between said connector plates and the ends of said valve body band.

3,371,678
NON-RETURN VALVE WITH ROTATING MEANS
John Anders Rydberg, Stockholm, Sweden, assignor to Aktiebolaget Gustavsbergs Fabriker, Gustavsberg, Sweden, a corporation of Sweden
Filed May 7, 1964, Ser. No. 365,637
Claims priority, application Sweden, May 7, 1963, 5,007/63
1 Claim. (Cl. 137—331)

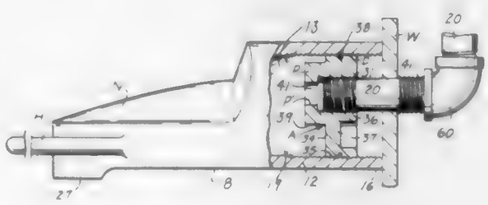
1. A valve comprising a seat in the form of a groove with a substantially V-shaped cross-section having at least one through flow opening in its bottom and a cylindrical

valve member of an elastic material which is responsive to pressure differential thereon to be lifted from its seat and is mounted for free rotation about its axis when the valve is in open position and engages the walls of the groove with its outer cylindrical surface when it is in



closed position, and stopping means for limiting the opening movement of said valve member, said stopping means extending along the whole length of the valve member and being unsymmetrically arranged relative to said axis so that said valve member automatically is given a rotation movement.

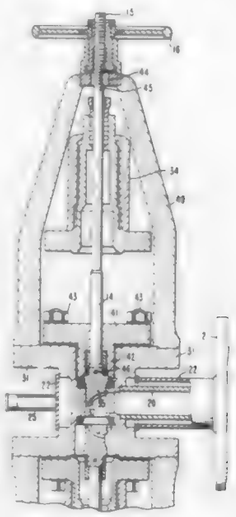
3,371,679
FITTING ADAPTER AND NOZZLE ASSEMBLY
Angelo Minella, Houston, Tex., assignor to A. Minella Plumbing Supplies, Inc., a corporation of Texas
Continuation-in-part of application Ser. No. 365,320, May 6, 1964. This application June 21, 1966, Ser. No. 559,263
9 Claims. (Cl. 137—328)



A cylindrical adapter is provided with threads on its outer cylindrical surface and an eccentrically disposed opening extending through the body of the adapter between the circular surfaces of the cylinder. The threaded surface engages internal threads formed in the base of a combined water nozzle and handle fitting and the eccentric opening is secured to a water conduit projecting from a wall surface. Positioning of the nozzle in a plane parallel to the plane of the wall is effected by rotating the adapter about the conduit while adjustment of the space between the wall and the base of the nozzle is effected by varying the degree of threaded engagement of the nozzle and the adapter.

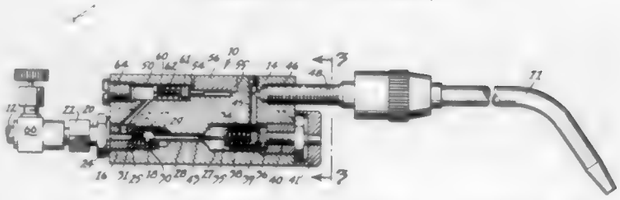
3,371,680
DOUBLE PLUG VALVE
Maurice Lee Alcorn, Jr., Greenville, N.C., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Dec. 15, 1964, Ser. No. 418,435
3 Claims. (Cl. 137—340)

A jacketed double-plug valve for handling high-melting-point viscous fluids, one valve and the adjacent outlet conduit are capable of being cleaned out without disrupting the flow through the other conduit. The valve disclosed comprises a valve body with an entry conduit and two exit conduits, the exit conduits having tapered solid plug-type valves with the valve stem located in the respective discharge flow paths, a bonnet assembly connected to the discharge conduit covers each valve, a tall yoke encases each bonnet assembly, and is connected to the valve body and clamping means are provided for



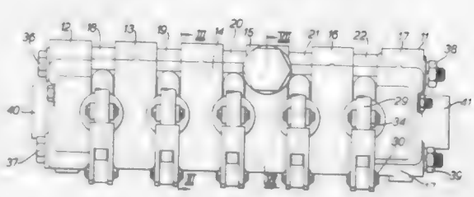
holding the plug in a closed position while the associated bonnet and yoke are removed for cleaning purposes.

3,371,681
TORCH HANDLE STRUCTURE
Jim B. Thomas, 1902 Church St., Nashville, Tenn. 37203
Filed Sept. 7, 1965, Ser. No. 485,224
1 Claim. (Cl. 137—557)



A torch handle structure including a pressure gauge and a pressure regulating mechanism, a fluid inlet bore in the bottom rear portion of the handle structure receiving a hose connector and an outlet bore in the front upper portion of the handle structure receiving a torch tip adapter parallel to the longitudinal axis of the handle structure.

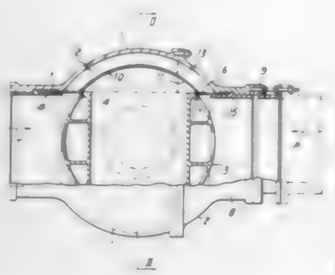
3,371,682
SLIDE VALVES
John C. E. Flint, Chalford, England, assignor, by mesne assignments, to Dowty Hydraulic Units Limited, Brockhampton, England, a British company
Filed Nov. 19, 1965, Ser. No. 508,793
Claims priority, application Great Britain, Mar. 3, 1965, 9,075/65
13 Claims. (Cl. 137—596.12)



This application discloses a multiple slide valve assembly including a plurality of casing plates, each pair of plates being separated one from the other by a slider frame housing a ported slider which is of rectangular cross-section, the casing plates and slider frames being removably connected together (to allow the interchange

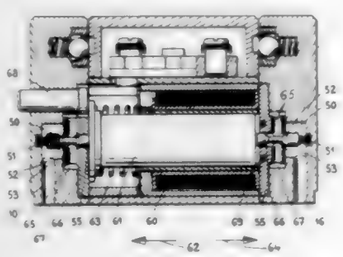
of one casing plate and/or slider frame and/or slider for a casing plate and/or slider frame and/or slider already in the multiple slide valve), passageways in the plates and/or frames enabling fluid supplied to the multiple slide valve to be available at each slider for direction to a respective service, and each slider being capable of controlling exhaust of fluid from the service, one plate, frame and slider combination, at least, having an operating characteristic different from that of at least one other such combination.

3,371,683
HYDRAULIC VALVES
James Wardhaugh Stephenson, London, England, assignor to Boving and Co. Limited, London, England, a British company
Filed Dec. 22, 1964, Ser. No. 420,376
Claims priority, application Great Britain, Jan. 16, 1964, 1,982/64
5 Claims. (Cl. 137—599.1)



A hydraulic valve which includes a valve rotor, a bypass passage and a throttle member serves as a dual-purpose valve for full-bore or throttle flow, particularly in a turbine-pump installation.

3,371,684
PNEUMATIC OR THE LIKE VALVE CONTROL ARRANGEMENT
Michel Louis André Tissot-Dupont, Annecy, France, assignor to S. T. Dupont, Paris, France
Filed Sept. 8, 1964, Ser. No. 394,848
Claims priority, application France, Sept. 11, 1963, 947,243
3 Claims. (Cl. 137—609)



1. A control valve comprising; a valve housing having an internal chamber with a pair of opposing end faces, a core mounted within said chamber for reciprocating movement between said end faces,

spring means for biasing said core against one of said end faces,

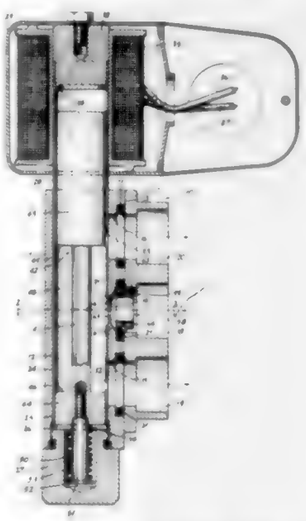
electro-magnetic means for counteracting the biasing of said spring means and for moving the core against the other of said end faces,

passage means in each end of said housing having respective inlets and outlets,

a bore in each end face interconnecting the chamber and respective passage means, a pair of valve means for controlling flow in said passage means, each of said valve means having an operating spindle projecting through one of said bores and into said chamber when the valve means are in the closed position,

and biasing means for each said valve means biasing the valve means to the closed position; whereby the core when the electro-magnetic means is not energized will contact one of said valve spindles and open the corresponding valve means against the influence of its biasing means and when energized will contact the other of said valve spindles and open the corresponding valve means against the influence of its biasing means.

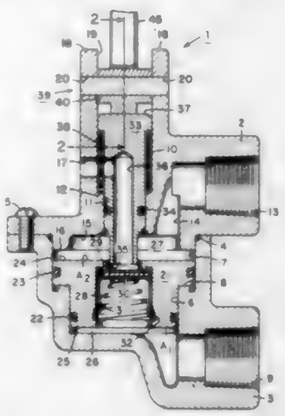
3,371,685
THREE-WAY VALVE WITH BUILT-IN PRESSURE CONTROL
Ralph B. Tilney, Sr., Clayton, Mo., assignor to Alco Controls Corporation, a corporation of Missouri
Filed June 8, 1964, Ser. No. 373,180
1 Claim. (Cl. 137—625.11)



1. In a liquid circulation system having means to circulate the liquid under various pressures and having alternate circuits through which the liquid is to be circulated, a three-way valve having an inlet port for connection to the circulating means and having two separate outlet ports for connection to the alternate circuits, the valve comprising a housing, a chamber within the housing, the inlet and outlet ports opening through the side of the housing and communicating with the chamber, the inlet port being positioned between the two outlet ports, a piston slidable within the chamber, the piston having fluid-conducting space means for connecting the inlet with each outlet port, and of a length greater than the spacing between the outlet ports so that there is always communication between the inlet and one or both outlet ports, regardless of the position of the piston, motor means for sliding the piston for alternately establishing communication between the inlet port and each of the outlet ports, the piston having ends beyond the communication between the inlet ports and the outlet ports of substantially the same diameter as that of the chamber, there being sufficient leakage between the said ends of the piston and the side of the chamber to subject the said ends of the piston to liquid pressure within the chamber, the piston and chamber being free of mutually engageable liquid seals which would block the said leakage, part of the leakage pressure being relieved by an outlet port leaving a net lateral force pressing the piston against the

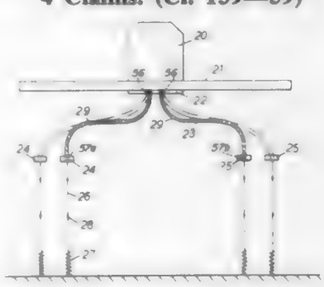
side of the chamber, and means to limit the pressure within the chamber comprising a flow control on the inlet side of the chamber, the flow control comprising a flexible member having a passage through it for maintaining communication between the inlet port and the chamber, the flexible member having a face exposed to inlet pressure and being sufficiently flexible to deflect and reduce the diameter of the passage according to the magnitude of inlet pressure and accordingly increase the pressure drop through the opening.

3,371,686
MULTI-POSITION CONTROL VALVE
Richard C. Bueler, Glendale, Mo., assignor to Wagner Electric Corporation, Newark, N.J., a corporation of Delaware
Filed Dec. 22, 1966, Ser. No. 604,024
14 Claims. (Cl. 137—625.5)



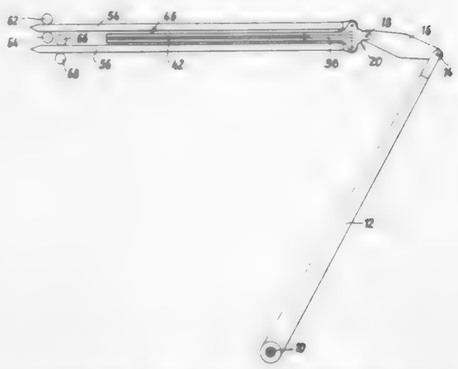
A multi-position control valve including a fluid pressure responsive member movable toward an operative position in response to fluid pressure supplied thereto, and when in said operative position, a cam actuated valve operator can be moved toward a "dumping" position opening a valve element carried by said member to effect a "dumping" application of the supplied fluid pressure and toward an exhausting position disengaged from said valve element to vent the applied fluid pressure. Opposed differential areas are provided on said member in a predetermined ratio, and the valve operator and said member are cooperatively movable to a metering position establishing an applied fluid pressure in a ratio with the supplied fluid pressure substantially equal to the ratio between the differential areas on which the supplied and applied fluid pressures respectively act.

3,371,687
HARNESSES FOR JACQUARD MACHINES
David A. Stead, 8 Haycliffe Lane 5, Bradford, England
Filed July 6, 1966, Ser. No. 563,214
4 Claims. (Cl. 139—59)



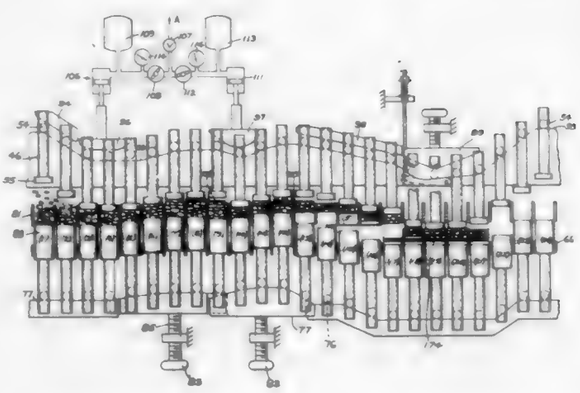
Harness cords of a Jacquard mechanism extend between the bottom board and the comber board through a tube that is flexible but capable of retaining a given shape. By changing the tube shape the length of cord between the bottom and the comber boards may be maintained constant in any lateral adjusted position of the comber board, and this dispenses with the need of vertical adjustment of the comber boards which was necessarily attendant to their lateral adjustment, to keep the heald eyes at constant level.

3,371,688
DOUBLE WEFT THREAD PICKING MEANS FOR SHUTTLELESS LOOMS
Waldemar Liebchen, Grossostheim unter Aschaffenburg, Germany, assignor to Jean Gusken, Dulken, Rhineland, Germany
Filed May 11, 1966, Ser. No. 549,293
Claims priority, application Germany, May 11, 1965, G 43,562
7 Claims. (Cl. 139—123)



A shuttleless loom has, for the purpose of introducing threads simultaneously from the same side of the shed, carrier rods guided in pairs of rollers; the inner ends of the carrier rods are pivoted to a carrier body which is guided for sliding movement in a direction parallel to the length of the rods and is moved through a pivoted link by a swinging lever.

3,371,689
APPARATUS FOR PACKING FOOD PRODUCTS
Eben H. Carruthers, Warrenton, Oreg. 97146
Filed June 18, 1965, Ser. No. 464,927
5 Claims. (Cl. 141—81)



1. A machine for packing a food product in containers wherein a basin having measuring chambers is driven through a path of travel; product deposited on the basin is urged into the measuring chambers as the measuring chambers move through their path of travel; and containers are moved through a path of travel which includes a container filling position beneath and in alignment with said measuring chambers comprising, in combination:

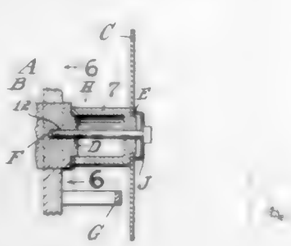
(a) means including lower plungers for supporting and compressing the product into cakes;

(b) means for withdrawing the plungers from the measuring chambers and transferring the cakes of product from the measuring chambers to the containers in succession;
(c) means below said containers for catching any crumbs of product which may break off from a cake prior to transfer; and
(d) means for adding the crumbs from one cake to a succeeding cake of product.

3,371,690
FILLING DEVICE FOR MEAT LOAF MOLDS
Richard A. Hawley, 2440 Scout Road, Oakland, Calif. 94611
Filed June 21, 1965, Ser. No. 465,326
3 Claims. (Cl. 141—99)

A filling device, for meat loaf molds, which includes two pairs of horns adapted in alternation to receive a dual mold unit thereon for filling with meat loaf material pressure-fed through the corresponding pair of horns; there being means provided in the device to assure that only the pair of horns having a dual mold unit thereon will be supplied with meat loaf material under pressure.

3,371,691
ADAPTOR FOR POWERED ROTARY HAND SAWS
Calvin C. Ebinger, 16123 Grevillea, Lawndale, Calif. 90260
Filed Oct. 23, 1965, Ser. No. 503,819
2 Claims. (Cl. 143—155)

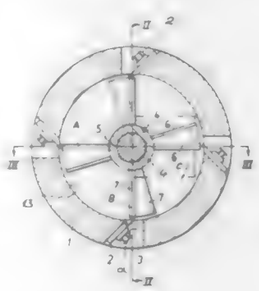


The invention relates to an attachment for powered rotary hand saws of the type embodying a driven rotary shaft having on its outer end a circular saw blade; said attachment being adapted to be interposed between the outer end of the shaft and the saw blade for the purpose of positioning the blade beyond a guard with which the saw is equipped whereby the blade may be positioned flat-wise close to a wall surface in parallel relation thereto and at right angles relative to the rotary shaft, the invention residing in an attachment which is so constructed that it may be applied to the outer blade carrying butt end of the conventional drive shaft of a well-known type of hand saw in place of the saw blade usually mounted thereon and then afford a supplemental mounting for the blade in outward relation to the blade guard.

3,371,692
METHOD FOR HARVESTING TREES
Robert W. Larson and John W. Hood, Ashland, and John P. Lundberg, Washburn, Wis., assignors to Beloit Corporation, a corporation of Wisconsin
Original application June 13, 1963, Ser. No. 287,543, now Patent No. 3,238,981. Divided and this application Feb. 25, 1966, Ser. No. 529,989
3 Claims. (Cl. 144—309)

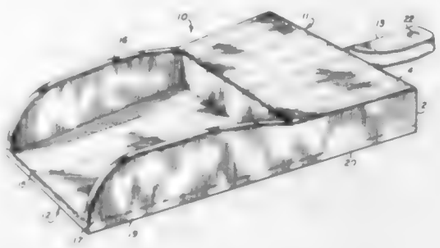
1. A method of harvesting a plurality of spaced standing trees comprising the steps of encircling and tightly gripping a plurality of spaced standing trees about their upper portions to bring them into contacting relationship with each other to form a cluster thereof, cutting the trees at and from their bases and continuing to grip the trees, clamping the trees adjacent the cut bottom thereof, and delimbing said cluster of trees.

3,371,693
COMMINUTING MACHINE FOR WOOD
Peter Voelskow, Hildesheim, Germany, assignor to Hombak Maschienfabrik K.G., Bad Kreuznach, Germany, a corporation of Germany
Filed Nov. 18, 1965, Ser. No. 509,262
4 Claims. (Cl. 144—172)



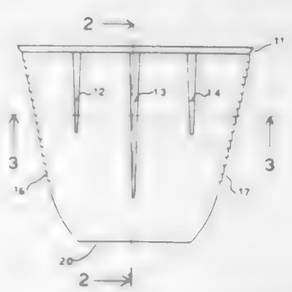
A wood-comminuting machine having a blade ring with a plurality of angularly spaced openings about an axis, a respective blade in each opening projecting into the interior of said ring for comminuting wood particles swept past the blades, a rotor rotatable about this axis relatively to the ring and having a plurality of angularly spaced generally radial vanes alternately inclined to opposite sides of the axis with each sweeping only part of the axial width of the chamber and a drive for rotating the ring and the rotor relatively whereby the vanes deflect wood particles within the chamber alternately in opposite directions and away from the walls.

3,371,694
COMBINATION SCOOP AND CUTTING BOARD
Ernest W. Miller, 420 Patch Ave.,
San Jose, Calif. 95128
Filed Apr. 9, 1965, Ser. No. 446,928
3 Claims. (Cl. 146—215)



A combination scoop and cutting board in which a cutting board is integrally connected on one side to an open ended scoop having vertical side walls and on the other side to a handle.

3,371,695
POCKET PORTABLE DRINKING CUP
Robert M. Lamb, 915 Oswego St.,
Liverpool, N.Y. 13088
Filed Mar. 20, 1967, Ser. No. 624,256
1 Claim. (Cl. 150—.5)

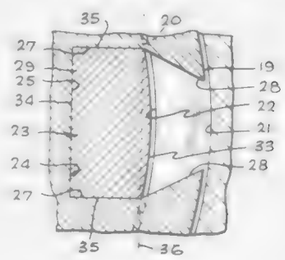


A drinking cup molded from polyethylene into a unit generally oblong in its horizontal sections and tapering towards the bottom. It is resilient so that when the narrower sides are pressed between the thumb and forefinger inwardly towards each other, the cup assumes a drinking cup shape with rounded protruding pour lips adjacent the narrow sides. It automatically returns to its normal molded shape upon release of the pressure.

3,371,696
RECLOSABLE BAGS WITH RIB AND GROOVE ELEMENTS FORMED OF DIFFERENT MATERIALS
Steven Ausnit, 124 E. 61st St., New York, N.Y. 10021
Filed Oct. 22, 1965, Ser. No. 500,652
6 Claims. (Cl. 150—3)

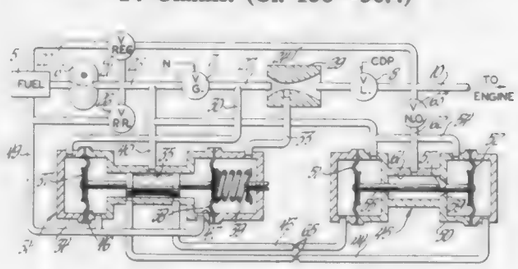
1. A sheet with a flexible closure comprising:
a web portion and a marginal portion,
said web portion being formed of a first thermoplastic substance having a given set of physical characteristics,
said marginal portions having interlocking rib and groove elements extending longitudinally thereon for providing a lock therebetween,
said interlocking rib and groove elements being formed entirely of a separate second thermoplastic substance having a different set of physical characteristics from that of said first thermoplastic substance.

3,371,697
THREADED ELEMENTS WITH LOCKING KEYS
Cullen E. James, Southgate, Calif., assignor to Newton Insert Co., Los Angeles, Calif., a corporation of California
Filed Apr. 22, 1966, Ser. No. 544,446
2 Claims. (Cl. 151—23)



A fastener including an element having external threads through which an axial groove extends, with a locking key received in the groove and adapted to be driven axially therein to lock the element against removal from a carrier part. The key has a mounting portion frictionally retained within the groove and defined by a radially outer cylindrically curved surface, a radially inner planar surface, and two parallel planar surfaces extending generally radially therebetween. The key also has a locking portion which is axially outwardly of its mounting portion and is cylindrical and essentially tangent at its radially inner side to the plane of a planar inner wall of the groove. The groove has side walls which, in extending radially outwardly, have first parallel portions and outer converging dovetail portions, with the cylindrical locking portion of the key being of a width corresponding approximately to the width of the groove between its side walls.

3,371,698
ISOCHRONOUS GOVERNOR
Alan L. Hitzelberger, Grand Blanc, and Kenneth G. Leslie, Fenton, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed July 26, 1965, Ser. No. 474,559
14 Claims. (Cl. 158—36.4)



A fuel control for a gas turbine including means to correct fuel flow to provide isochronous operation. In normal governing operation, the fuel flow is controlled by a governor valve responsive to engine speed across which the pressure drop is maintained constant. Since the valve opening is a direct function of speed, the flow through the valve is a predetermined value at the isochronous speed. This flow may be measured directly, but preferably the

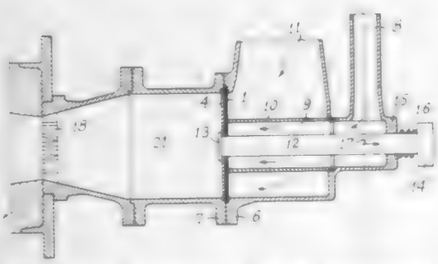
pressure drop across the valve is used as a measure of flow to control valve means supplementing the fuel flow to the engine. This supplemental fuel control may integrate the speed error or may have a valve responsive both proportionally and integrally to the fuel flow through the governor. Pressure drop across the governor valve may be balanced against a fuel limiting valve open in steady-state operation or against an orifice provided for the purpose.

3,371,699

GAS BURNER WITH PROPORTIONAL MIXER

André Henri Riot, Pamiers, France, assignor to Societe Metallurgique d'Imphy, Paris, France, a company of France

Filed June 23, 1966, Ser. No. 559,807
Claims priority, application France, July 5, 1965, 23,488
2 Claims. (Cl. 158—119)



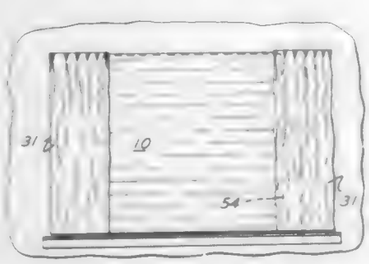
1. A gas burner comprising a gas admission conduit, an air admission conduit concentric with said gas conduit, a valve in said gas conduit, a plate closing said conduits, two series of openings in said plate one of said series passing the gas and the other of said series passing the air, means for actuating said valve by the air pressure in said air conduit for maintaining the gas pressure and the air pressure equal upstream of said plate, the total area of said series of openings for the gas and the total area of said series of openings for the air providing a predetermined constant ratio of the volume of the air to the volume of the gas downstream of said plate and means for adjusting the total volume of gas and air downstream of said plate by simultaneously obturating fractionally equal numbers of openings in said two series of openings.

3,371,700

WINDOW SHADE

Ralph Romano, Levittown, Pa., assignor of ten percent to Harold B. Lipsius and ten percent to Arthur H. Seidel, both of Philadelphia, Pa.

Continuation-in-part of application Ser. No. 407,631, Oct. 30, 1964. This application Jan. 13, 1967, Ser. No. 609,025
6 Claims. (Cl. 160—84)



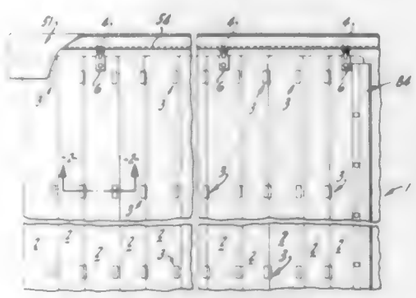
A window shade and brackets for supporting such window shade wherein the brackets are severable to accommodate drapes which may be supported adjacent the window shade. The shade, when extended, presents a corrugated appearance and is highly attractive. The brackets permit the shade to be alternatively mounted substantially flush with a ceiling, to be mounted inside a window casing or outside a window casing. The severed brackets will support drapes adjacent the window shade irrespective of the position in which the window shade is mounted.

3,371,701

FOLDABLE PANEL STRUCTURE AND METHOD OF ASSEMBLY

Andrew J. Toti, 311 W. River Road, Modesto, Calif. 95351

Filed Oct. 22, 1965, Ser. No. 501,184
18 Claims. (Cl. 160—235)



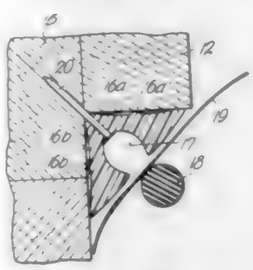
An accordion foldable panel structure and method of assembling the same. The structure is defined by a series of hingedly interconnected panels in which the hinges between adjacent panels are formed integral with the panels so that separate hinge structures are not required. The hinges comprise enlarged tongues on one panel received directly in slots in an adjacent panel. The dimension of each tongue is such that it may not be removed under normal conditions from an associated slot.

3,371,702

STORM WINDOW CONSTRUCTION MEANS

Robert M. Keegan and Robert W. Jones, Kansas City, Mo., assignors, by mesne assignments, to Aladdin Manufacturing Company, Inc., Odessa, Mo., a corporation of Missouri

Filed Sept. 23, 1965, Ser. No. 489,489
5 Claims. (Cl. 160—392)



A flexible strip operable to be nailed to a frame supporting structure such as a window frame. The strip has a groove running longitudinally the length of one side with a deformable restricted throat for receiving and holding a cylindrical bead therein. A flexible plastic sheet is secured within the groove by the bead to facilitate the covering or enclosing of said structure.

3,371,703

SONIC METHOD AND APPARATUS FOR TINNING AND CASTING METALS

Andries C. de Wilde, Warren, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Mar. 30, 1964, Ser. No. 355,635
5 Claims. (Cl. 164—49)

1. A method of wetting a metal surface with a molten metal comprising the steps of:

torsionally vibrating an elastic column producing a

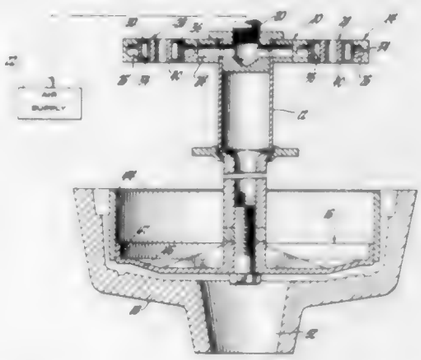
standing wave vibration at the resonate frequency thereof causing alternating torsional deflections to occur at opposite ends of said column, the deflection at one end being generally 180 degrees out of phase with the deflection at the other end at the resonate frequency,

supporting said column at the nodal point where torsional deflection is at a minimum,

supporting a metal body at one end of the column so that it receives oscillatory excitations therefrom,

placing said body while in said oscillating condition in a container, and

introducing molten metal into the container to mechanically attack and wet the surfaces of said body as a result of the shearing action between the molten metal and body surfaces.



3. Sonic vibratory apparatus for wetting the surface of a ferrous metal article located in a bath of molten non-ferrous metal, comprising an elastic member, vibration generating means connected to said elastic member, a source of compressed air for driving said vibration generating means at a resonant standing wave frequency of said elastic member so as to establish at least one nodal point and one antinodal point along said member, a coupling member extending from said elastic member at an antinodal point thereof, and means for supporting said elastic member so that said coupling member is located in said bath for delivering high frequency vibratory energy to the molten non-ferrous metal adjacent said surface of said article.

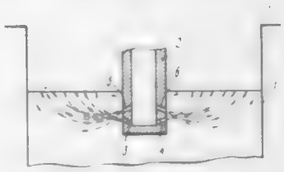
3,371,704

DEVICE FOR SUPPLYING MOLTEN METAL INTO A MOULD OF A CONTINUOUS CASTING MACHINE

Evgeny Ivanovitch Astrov, Moskovskoe Shosse, 135, kv. 52; Anatoly Dmitrievitch Klipov, Ulitsa Gastello, 15, kv. 12; and Nicolai Alexandrovitch Polushkine, Moskovskoe Shosse, 89, kv. 30, all of Gorky, U.S.S.R.; and Victor Savelievitch Routes, 7 Parkovaya Ulitsa, 15, kv. 12, Moscow, U.S.S.R.

Filed Feb. 20, 1967, Ser. No. 617,235

4 Claims. (Cl. 164—281)



A sleeve extending axially into the interior of a mold for discharging liquid metal into the mold through lateral channels formed in the sleeve and disposed circumferentially therein in groups, each of which has at least two channels therein at different levels and inclined towards one another such that the axes of the channels intersect outside the sleeve and within the mold.

3,371,705

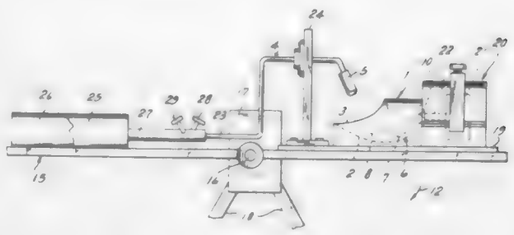
CENTRIFUGAL CASTING APPARATUS WITH SPECIAL FEED MEANS

Vittorio Ghiorzo and Francesco Ghiorzo, both of 328 W. 44th St., New York, N.Y. 10036

Continuation-in-part of application Ser. No. 414,148, Nov. 27, 1964. This application Apr. 14, 1965, Ser. No. 448,118

Claims priority, application Italy, Nov. 27, 1963, 24,605/63; Dec. 7, 1963, 25,254/63; Apr. 14, 1964, 735,062

5 Claims. (Cl. 164—289)



The casting arm of a centrifugal casting machine for precious metals carries a crucible which has a melting chamber serving to accommodate a charge of metal. When the casting arm is held in a position of rest and the charge is caused to melt, molten metal fills a lower region of the melting chamber. Such lower region communicates with the inlet of a tunnel through which the metal is expelled into the cavity of a mold when the casting arm rotates. The outlet of the tunnel is located at a level above the inlet so that molten metal seals the open top of the melting chamber from the outlet of the tunnel when the casting arm is held in the position of rest.

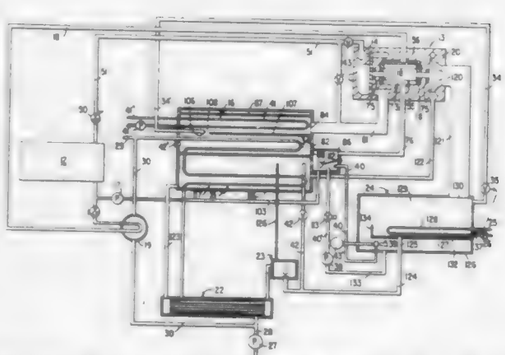
3,371,706

HEATING AND COOLING SYSTEM

Louis H. Leonard, Jr., De Witt, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware

Original application June 23, 1964, Ser. No. 377,319, now Patent No. 3,288,203, dated Nov. 29, 1966. Divided and this application Aug. 29, 1966, Ser. No. 575,773

7 Claims. (Cl. 165—1)



Method of operating a heating system of a steam condenser in which the capacity of the system is regulated by passing a noncondensible vapor into the steam condenser.

3,371,707

METHOD AND APPARATUS FOR CONTROLLING THE TEMPERATURE IN A ROOM

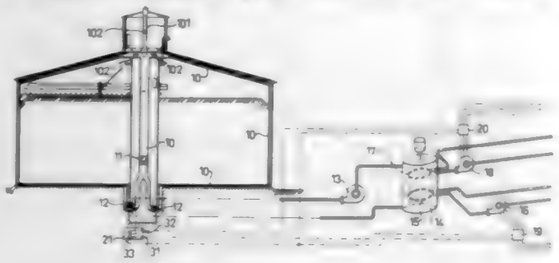
Nils Rudolf Martin Weibull, Malmo, Sweden, assignor to Ingenjorsfirman Nils Weibull AB, Malmo, Sweden

Continuation-in-part of application Ser. No. 501,073, Oct. 22, 1965. This application Dec. 30, 1966, Ser. No. 613,702

10 Claims. (Cl. 165—2)

Method and apparatus for controlling the temperature in a room by the control of the heat transfer to or from

such room in response to the arithmetic mean value of two temperatures, having an arithmetic mean value which



is proportional to the mean value of the temperature of the room.

3,371,708

ELECTRONIC COMPARATOR FOR SENSING AND AFFECTING CONDITIONS

John J. Chaparro, San Diego, Calif., assignor to Delta Design, Inc., La Mesa, Calif., a corporation of California

Filed Sept. 3, 1965, Ser. No. 484,988
6 Claims. (Cl. 165—26)

This invention relates to the control of conditions related to temperature and involves means to heat and means to cool, and it provides an improved comparator for automatically sensing and applying forces, and in this instance for activating and/or deactivating either of said two means in response to the temperature conditions surrounding said two means and with respect to a given selected temperature to be maintained.

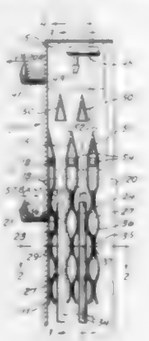
FALLING FILM PLATE HEAT EXCHANGER

Curt Fredrik Rosenblad, % Rosenblad Corp., P.O. Box 585, Princeton, N.J. 08540

Filed June 15, 1965, Ser. No. 464,011
24 Claims. (Cl. 165—115)



A heat exchanger or evaporator having generally vertically extending heat exchange plates joined at pairs of alternating opposite vertical edges to make a structure having channels alternately opening at one side and then the other. Liquid is applied in the form of a film on to the wall surfaces of one set of channels at the tops thereof and a vaporous heating medium is introduced into the other set of channels through the open sides thereof. The plates are preferably thin and are strengthened by corrugating them or by means of horizontal or vertical supports or combinations of the same. The corrugations or supports serve to direct the flow of condensate from the heating medium in a generally horizontal direction for discharge.

3,371,710

USE OF SURFACTANTS IN OIL RECOVERY

Robert R. Harvey and Thomas B. Reid, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed Mar. 25, 1965, Ser. No. 442,789
16 Claims. (Cl. 166—9)

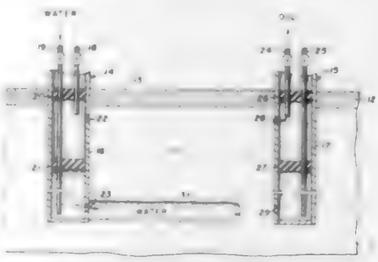
Waterflooding of an oil reservoir using a slug of nonionic surfactant dissolved in water is improved by controlling the ionic character of the reservoir environment, either reducing the monovalent ion content of the connate water which the slug contacts or incorporating multivalent ions in the aqueous slug of surfactant, or both, it having been found that monovalent ions such that Na^{+}, K^{+}, Cl^{-}, OH^{-}, etc. diminish the solubility of the surfactant and multivalent ions such as Ca^{++}, Al^{+++}, and Ce^{+++} increase solubility thereof.

3,371,711

VERTICAL FLOODING METHOD OF OIL RECOVERY

Aziz S. Odeh, Dallas, and Billy J. Dotson, Grand Prairie, Tex., assignors to Mobil Oil Corporation, a corporation of New York

Filed May 16, 1966, Ser. No. 550,346
7 Claims. (Cl. 166—9)



1. A method for recovering oil from a subterranean reservoir by vertical flooding with an injected fluid which comprises:

(a) providing spaced-apart input and output well means for conveying fluids between the earth's surface and a subterranean formation containing oil,

(b) injecting a fluid for displacing oil from the input well means into the formation, said fluid being introduced into said formation at an upper horizon when said fluid is less dense than the oil and at a lower horizon when said fluid is more dense than the oil, and the fluid being injected at the rate where the magnitude of the viscous forces is decreased relative to the gravitational and capillary forces, which forces exist between the fluids and the formation, sufficiently to maintain the injected fluid interface with the oil substantially horizontal until said injected fluid extends from the input well means toward the output well means,

(c) producing oil from said output well means at a rate not above the rate at which the fluid is being injected into the input well means, said oil being produced from one of the formation's oil producing horizons,

(d) when the injected fluid extends horizontally substantially to the desired lateral distance from the input well means to the output well means, increasing the rate at which the fluid is injected into the input well

means but not to such magnitude that the formation is fractured continuously thereby,

(e) producing oil from the output well means at an increased rate but not exceeding that rate at which the fluid is then being injected, and said oil being produced at a horizon vertically opposite from the horizon at the input well means into which fluid is being injected into the formation,

(f) controlling the rate of oil production at a magnitude slightly below that critical rate of petroleum production where opposing differential gravitational forces acting on the horizontal fluid-oil interface are exceeded by the pressure gradients in the formation adjacent the output well means to disrupt the planar interface, and

(g) said oil production being continued until a substantial part of the formation is filled with the injected fluid.

3,371,712

COMPOSITION AND METHOD OF AGGLOMERATING AND STABILIZING PARTICULATE MATTER BY CHEMICAL TREATMENT

Nicholas M. Adams, Chicago, Ill., assignor to Nalco Chemical Company, Chicago, Ill., a corporation of Delaware

No Drawing. Filed Apr. 19, 1966, Ser. No. 543,509
15 Claims. (Cl. 166—33)

1. A process of aggregating particulate matter to produce exceptionally high strength agglomerates thereof which comprises the steps of contacting said matter in the presence of water with a polymerizable mixture comprising 25–75% by weight of an unsaturated polyester, 20–50% by weight of a colloidal silica sol containing 10–60% by weight of substantially discrete, dense non-agglomerated particles of silica colloidally dispersed in an aqueous liquid, 6–25% by weight of an alkali metal silicate, and 0.2–8% by weight of a catalyst, and effecting polymerization of said mixture in the presence of said particulate matter whereby said matter and said mixture are converted to a substantially water-impermeable mass, characterized as possessing superior strength.

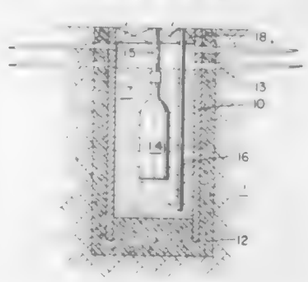
11. As a composition of matter, a polymerizable mixture which comprises 25–75% by weight of an unsaturated polyester, 20–50% by weight of a colloidal silica sol containing 10–60% by weight of substantially discrete, dense non-agglomerated particles of silica colloidally dispersed in an aqueous liquid, 6–25% by weight of an alkali metal silicate, and 0.2–8% by weight of a catalyst.

3,371,713

SUBMERGED COMBUSTION IN WELLS

Daniel Silverman, Tulsa, Okla., assignor to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware

Filed July 25, 1966, Ser. No. 567,576
16 Claims. (Cl. 166—38)



1. A method for steam flooding an underground formation penetrated by a well comprising:

providing in said well a container with a closed bottom, at least the lower portion of said container being substantially impermeable,

providing a burner placed entirely within the substantially impermeable portion of said container,

supplying a combustible fluid and an oxygen-containing gas to said burner, said fluid and gas being supplied in a combustible ratio,

igniting the combustible mixture in the burner,

introducing into said container water in an amount greater than the amount evaporated by combustion of said combustible mixture,

and maintaining in said well a pressure sufficient to force the resulting steam, water and combustion products into said formation.

10. Apparatus for generating steam in a well for steam flooding a formation penetrated by said well, said apparatus comprising:

a container in said well, at least the bottom portion of said container being substantially impermeable,

a burner entirely within the substantially impermeable portion of said container,

means extending from the top of said well for supplying a combustible fluid and an oxygen-containing gas to said burner,

means extending from the top of said well for supplying more than sufficient water to said container to maintain at least the impermeable portion of said container full when said burner is in operation,

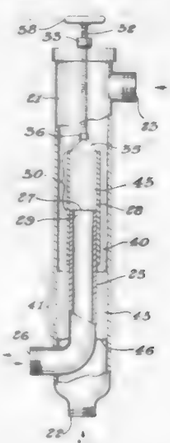
and means for igniting the mixture of combustible fluid and oxygen-containing gas in said burner.

3,371,714

REDUCING THE PRESSURE ON AQUEOUS SOLUTIONS OF POLYMERS

Melvin F. Katzer, Danville, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Filed Mar. 25, 1965, Ser. No. 442,718
5 Claims. (Cl. 166—42)



1. A method for significantly reducing the pressure on a solution of a high molecular weight, essentially linear polymer with minimal molecular degradation of the polymer which comprises flowing the polymer solution under pressure through a porous-bed contained within a conduit, said porous-bed being insoluble in, and permeable to, the polymer solution to achieve the desired pressure reduction.

3,371,715

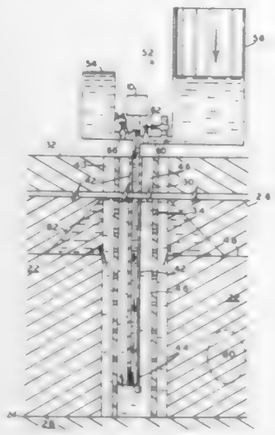
PROCESS OF TREATING A WATER BEARING FORMATION

Anderson Billy Fly and William David McDearman, Jr., Amarillo, Tex., assignors to Hydro-Jet Services, Inc., Amarillo, Tex., a corporation of Texas

Filed Sept. 20, 1965, Ser. No. 488,480
7 Claims. (Cl. 166—42)

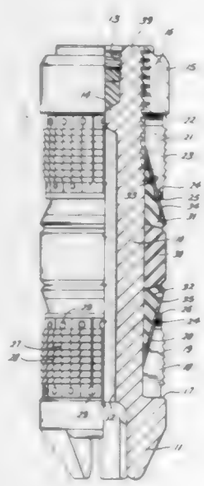
This invention teaches treating zones radially distant

from a single well bore by use of flow of liquid to control



and direct the flow of treating agents to zones remote from a well bore.

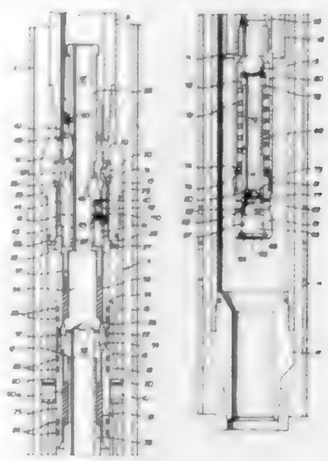
3,371,716
BRIDGE PLUG
James H. Current, Houston, Tex., assignor, by mesne assignments, to Schlumberger Technology Corporation, Houston, Tex., a corporation of Texas
Filed Oct. 23, 1965, Ser. No. 503,503
2 Claims. (Cl. 166—118)



A well tool having slips and packing and an elastomeric expander member with a high durometer hardness value relative to the packing, whereby the expander can function efficiently to expand the slips as well as preventing extrusion of the packing under pressure.

3,371,717
MULTIPLE ZONE WELL PRODUCTION APPARATUS
David V. Chenoweth, Houston, Tex., assignor to Baker Oil Tools, Inc., City of Commerce, Calif., a corporation of California
Filed Sept. 21, 1965, Ser. No. 488,943
26 Claims. (Cl. 166—147)

Apparatus for conducting fluid between a plurality of longitudinally spaced production zones in a well bore and the top of the well bore, in which a casing string in the well bore has longitudinally spaced openings or perforations communicating with the zones and a tubing string in the casing string is in sealed relation to one or more packers set in the casing string between the perforations to isolate the spaced perforations from one another, a flow regulator being disposed in the tubing string



at each zone, this regulator having an orifice to reduce the pressure of fluid flowing between its associated zone and the tubing string.

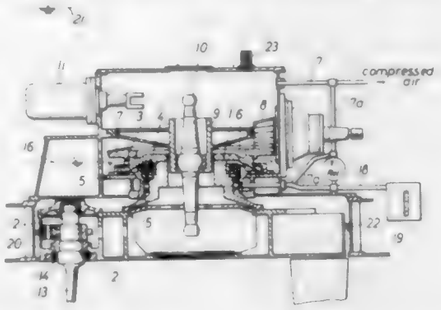
3,371,718
ROTARY JET REACTION MOTORS
Henry S. Bacon, Box 196, Shrewsburg, N.J. 07701
Filed Sept. 7, 1966, Ser. No. 577,631
2 Claims. (Cl. 170—135.4)

A thrust producing rotary propeller having a plurality of concentrically mounted rotor blades mounted on a central shaft and a jet reaction engine mounted on the tip of each blade. Each of said jet reaction engines shaped in an arc and positioned within a circular pattern for rotation. Each jet reaction engine formed with a cornucopia shaped air scoop having an enlarged open mouth to scoop air during rotation and a progressively tapered integral area throughout its length to compress the air passing therethrough and the reduced end of the air scoop connected to said jet reaction engine. Said central shaft and blades being hollow and a fuel line and ignition cables strung therethrough to carry fuel to said jet reaction engine and the means of igniting the fuel for operation.

3,371,719
BLADE WHEEL SHIP PROPELLER
Wolfgang Baer, Heidenheim-Mergelstetten, Germany, assignor to J. M. Voith GmbH, Heidenheim, Germany
Filed Feb. 16, 1967, Ser. No. 616,536
Claims priority, application Germany, Feb. 26, 1966, V 30,485
4 Claims. (Cl. 170—146)

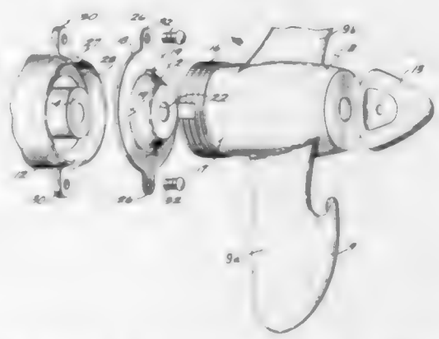
The present invention relates to a blade wheel ship propeller including a housing, a hollow shaft in said housing, a wheel body including propeller blade pivots

drivingly connected to said hollow shaft to be driven thereby, and a propeller well, in which first sealing means are interposed between said housing and said hollow shaft while second sealing means surround said propeller blade pivots for sealing the same toward the outside water. The said wheel body and said housing together form a com-



pressed air receiving and storing vessel adapted to be connected to a source of compressed air, while pressure control means communicating with the interior of said vessel is provided for controlling the pressure therein so as to maintain the same in said vessel above the pressure of the water at the immersing depths of the propeller.

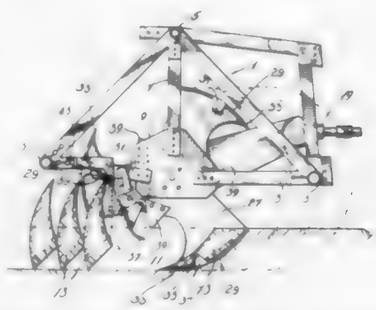
3,371,720
FISH LINE CUTTER
Clarence E. Blanchard, Jr., Kenosha, Wis., assignor to Outboard Marine Corporation, Waukegan, Ill., a corporation of Delaware
Filed Aug. 25, 1966, Ser. No. 575,061
11 Claims. (Cl. 170—160.23)



Disclosed herein is the combination, in a marine propulsion device, of a lower unit having a gear case, a propeller shaft mounted in said gear case and extending rearwardly therefrom and a propeller having a blade and a propeller hub supporting said blade and mounted on said shaft rearwardly of the gear case. The propeller hub has an outer face provided with a screw thread located between the blade and the gear case and having a pitch extending in the same general direction as the pitch of the propeller blade. In addition, cutting means are located between the lower unit and the propeller hub and mounted to the lower unit.

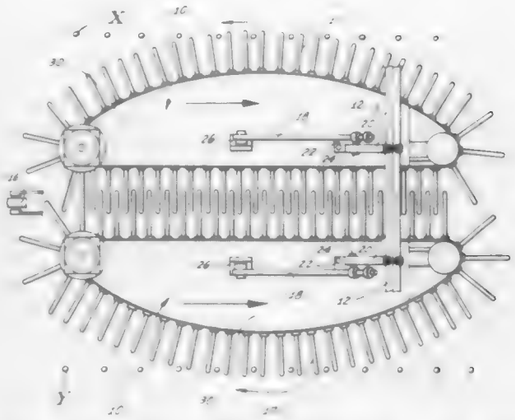
3,371,721
ROTARY SPADE PLOW
Edmond Mathis, 3625 Laurier St. E., Apt. 2, Montreal, Quebec, Canada
Filed Apr. 5, 1965, Ser. No. 445,517
6 Claims. (Cl. 172—112)

A rotary spade plough formed of a frame on which is rotatably mounted a spade-equipped wheel having a plurality of radial arms at the outer end of each one of which a spade is provided having a cutting leading edge adapted to come into engagement with the soil as the wheel rotates. Between each two arms and inwardly of the spades is a pivotable shoe mounted at the rearward end of the frame. Cams mounted on the radial arms between succes-



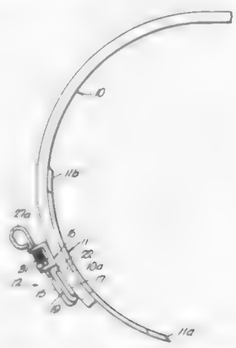
sive spades pivot the shoe outwardly, as the wheel rotates, to pack successive soil lumps cut by the spades.

3,371,722
CULTIVATOR
Edward D. Conner, 2700 Peterson Way, Apt. 9–A, Costa Mesa, Calif. 94500
Filed June 8, 1965, Ser. No. 462,259
6 Claims. (Cl. 172—546)



A cultivating mechanism is described in the following specification which is intended to be drawn, for example, by a tractor, or the like, down a row of crops, and which operates to remove weeds and loosen the soil around the crops, without damaging the crops themselves.

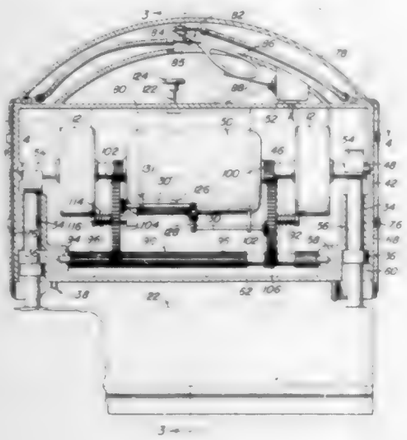
3,371,723
BLADE FASTENING ARRANGEMENT FOR IMPLEMENTS
Elmer J. Appl, Leoti, Kans. 67861
Filed June 14, 1965, Ser. No. 463,767
8 Claims. (Cl. 172—753)



A fastener assembly for releasably locking ground working blades to shanks of farm implements such as chisel plows. Each assembly includes a notched tongue member secured to the blade and projecting rearwardly

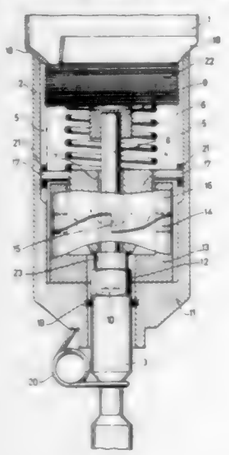
through an aperture in the shank. A bifurcated keeper member and a locking member engage the notched portions of the rearwardly extending tongue and cooperate with a spring biased sliding bolt to lock said blade to said shank in a fixed but easily releasable manner.

3,371,724
POWER WEDGE
Donald K. Crowell, 1967 San Gabriel St., San Bernardino, Calif. 92404
Filed Oct. 4, 1965, Ser. No. 492,637
16 Claims. (Cl. 173—123)



A triangular wedge element mounted on a drive unit which forms a continuation of the wedge shape of the element and which can be selectively power actuated so as to effect a driving of the wedge element into a workpiece for effecting a splitting of the workpiece. The entire tool, because of the shape thereof, advances into the wedge defined split so as to enable a continuous advance of the tool. The driving of the wedge-shaped element can be effected through the utilization of rotating cams or exploding cartridges.

3,371,725
ELECTRIC HAMMER DRILL ATTACHMENT
Johan Wilhelm Jansen, Eikbasserweg 238, Hilversum, Netherlands, and Hendrik Hoffmann, Johannes Poststraat 25, Amsterdam, Netherlands
Filed Mar. 1, 1966, Ser. No. 530,868
Claims priority, application Netherlands, Mar. 5, 1965, 65—2,797
8 Claims. (Cl. 173—123)



A barrel has a front end in which a tool holder is coaxially journalled for rotation and for limited sliding movement from a first position, to which it is urged, to an extended second position. A hammer member is reciprocable in the barrel and is normally urged into engagement with the inner end of the tool holder. A drive shaft drives the tool holder for rotation thereof. A pair of cooperating cam rings are so arranged in the barrel that, when the tool holder is in its second position, the tool holder only is rotated, and when the tool holder is in its first position, rotation of the tool holder is transmitted to one of the cam rings which in turn effects axial reciprocation of the other cam ring and thereby of the hammer which is operatively associated with the same, so that the hammer will strike axial blows upon the tool holder while the same rotates.

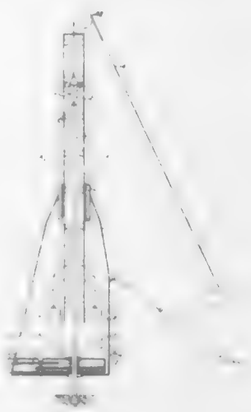
3,371,726
ACOUSTIC APPARATUS
John V. Bouyoucos, Rochester, N.Y., assignor to General Dynamics Corporation, a corporation of Delaware
Filed May 24, 1965, Ser. No. 458,245
35 Claims. (Cl. 173—134)

This application discloses percussive tools suitable for use in earth boring, pile driving and other applications. Tools utilize a hammer and anvil system wherein the hammer element is included within a hydroacoustic device which converts the flow of a pressurized fluid, such as hydraulic oil, into alternating mechanical energy as exhibited by oscillatory motion of the hammer element. The anvil element is spaced from the hammer element except when receiving impacts therefrom and extracts mechanical force pulses from the hammer element during alternate one-half cycles of the oscillatory motion of the hammer element. These force pulses are transmitted by the anvil system to the work. This transmission may be via a drill steel when the work is an earth formation which is being drilled.

3,371,727
DEVICE FOR THE ROTATION AND FEEDING OF A DRILLING STEM FOR ROTARY AND PERCUSSIVE-ROTARY DRILLING RIGS
Vasily Fedorovich Belousov, Cheljabinsk, Stanislav Nickolaevich Zhilin, Kopeisk, and Vladimir Dmitrievich Butkin, Cheljabinsk, U.S.S.R., assignors to Nauchno-Issledovatelsky i Proektno-Konstruktorsky Institute po Dobyche Poleznykh Iskopaemykh Otkrytym Sposobom, Cheljabinsk, U.S.S.R.
Filed Oct. 14, 1964, Ser. No. 403,847
7 Claims. (Cl. 173—148)

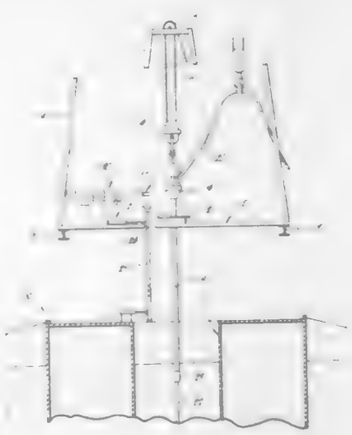
1. A device for the rotation and feeding of a drilling stem for rotary and percussive-rotary drilling rigs, comprising: a stationary mast including guides; a mov-

able mast having an upper end and a pulley thereon for supporting a tension member for pulling up a drilling stem, said movable mast being mounted in said guides for longitudinal reciprocation movement; a rotary table disposed in the lower part of said stationary mast; actuating cylinders coupled to said movable mast to move the same; a swivel adapted for being mounted



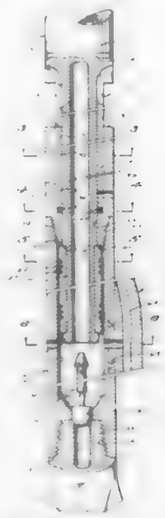
on the upper end of said drilling stem; a thrust mechanism coupled with said swivel and having retracted and extended positions; said movable mast including means engageable with said thrust mechanism in the extended position to transmit feeding effort to said drilling stem via said thrust mechanism, said thrust mechanism in the retracted position enabling unimpeded pulling up of the drilling stem.

3,371,728
KELLY STABBER
Robert Curtis Crooke, Corona Del Mar, Coral L. Cooper, Los Alamitos, and Nick Koot, South Laguna, Calif., assignors to Global Marine, Inc., Los Angeles, Calif., a corporation of Delaware
Filed Oct. 18, 1965, Ser. No. 496,949
7 Claims. (Cl. 175—85)



A base is fixed relative to a rotary table in a drilling rig as a part of apparatus for handling pipe and kelly joints during drilling operations. The apparatus includes jaw means movable toward and away from each other for releasably engaging a kelly joint. The jaw means are fitted with an adapter hingeable into cooperation therewith for converting the jaw means to grasp a drill pipe. The apparatus also includes means for reciprocating the jaw means toward and away from the base to and from the rotary table.

3,371,729
CIRCULATING STABILIZER-REAMER AND BUMPER
Charles J. Carr, 3079 W. Orange, Anaheim, Calif. 92804
Filed Oct. 12, 1965, Ser. No. 495,133
10 Claims. (Cl. 175—293)

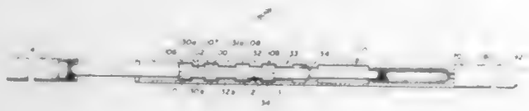


A combination fluid circuating stabilizer reamer and bumper tool for drilling wells engageable in an elongate drilling string of fluid conducting drill pipe and including, an elongate body having a central longitudinal flow passage, a tool joint portion at its upper end, a head portion below the tool joint portion and defining an annular, downwardly disposed bumper surface, an elongate central body portion of reduced diameter depending from the head portion, the upper portion of said body portion being splined, an elongate cylindrical bumper head depending from the body portion and defining an upwardly disposed annular striker surface at its upper end; an elongate barrel having a central flow passage and a tool joint portion at its lower end, a lower bore in the barrel and terminating therein to define an upwardly disposed bottom, said lower bore cooperatively receiving the bumper head for longitudinal shifting therein, an annular downwardly disposed bumper surface at the upper end of the lower bore and opposing the striker surface on the bumper head, an upper bore continuing upwardly from the lower bore, said upper bore slidably receiving the lower portion of the body portion, a socket in the upper end of the barrel and having splines slidably receiving and engaging the upper splined portion of the body portion, a socket in the upper end of the barrel and having splines slidably receiving and engaging the upper splined portion of the body portion; an annular upwardly disposed bumper surface on the upper end of the barrel opposing the striker surface on the head portion; and a plurality of circumferentially spaced, substantially longitudinally extending formation engaging stabilizing vanes fixed to and projecting radially outwardly from the barrel, said body being shiftable from an up position where the bumper surface on the bumper head engages and stops against the striker surface in the barrel, to a down position where the striker surface on the body engages the bumper surface on the barrel.

3,371,730
MECHANICAL DRILLING JAR
James L. Newman, 1321 Glen Cove, Richardson, Tex. 75080
Filed Sept. 20, 1965, Ser. No. 488,333
11 Claims. (Cl. 175—300)

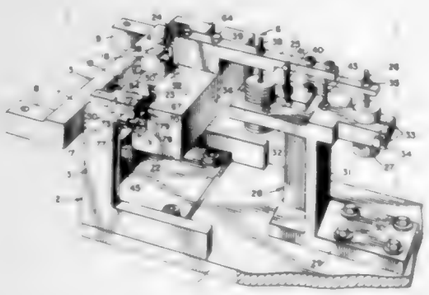
A drilling jar having a mandrel with a tool joint at the upper end, a knocker shoulder formed at the lower end

of the tool joint, a cylindrical sealing surface extending downwardly from the knocker shoulder, a mandrel sleeve having lugs disposed around the mandrel body and retained in place by a wash pipe threaded into the mandrel body, and an O-ring seal around the bottom end of the wash pipe. A sealing collar is disposed around the cylindrical sealing surface of the mandrel and has an upwardly facing knocker shoulder at the upper end and O-ring seals



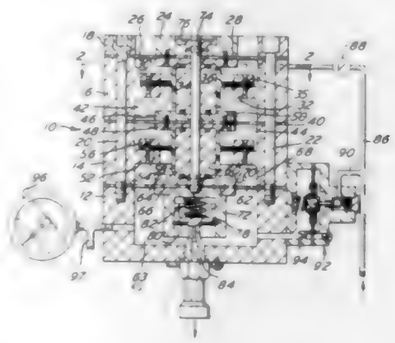
slidably engaging the cylindrical sealing surface of the mandrel. The housing body is threaded onto the sealing collar and contains lug means cooperatively engaging the lug means on the mandrel. A replaceable wash pipe sleeve having a cylindrical interior sealing surface cooperatively receiving the O-ring seal on the wash pipe is held in place in the housing body by a tool joint sub threaded into the lower end of the housing body.

3,371,731
VIBRATION-PROOF WEIGHING SCALE WITH FLEXURE PIVOTS
Robert H. Connors, Chicago, and King L. Klopfenstein, Prospect Heights, Ill., assignors to Triangle Package Machinery Company, Chicago, Ill., a corporation of Illinois
Filed Mar. 15, 1966, Ser. No. 536,215
21 Claims. (Cl. 177—47)



1. A weighing scale having a substantially equal mass moment system, comprising
(a) a frame,
(b) a first movable weighing element, including a load receiving member adapted to receive a quantity of a product to be weighed and having a predetermined mass,
(c) a second movable weighing element having a predetermined mass,
(d) a substantially vertical flexible member connecting said first weighing element to said second weighing element,
(e) guide means associated with said first weighing element to insure movement thereof in a substantially vertical path during the weighing operation,
(f) a pivot system having the pivot axis thereof fixed,
(1) a part of said pivot system being supported by said frame, and
(2) another part thereof being mounted on said second weighing element,
(g) spring means acting upon said weighing elements to control the movement thereof when weight is added to said load receiving member, the torque of said spring means being substantially zero at the time the quantity of product to be weighed is on said load receiving member,
(h) the mass of said first weighing element together with the product thereon being weighed, acting through said flexible member, multiplied by the distance from said flexible member to said fixed pivot axis, and the mass moment of said second weighing element being substantially equal in a horizontal plane through said fixed pivot axis, whereby a substantially balanced mass moment system in said horizontal plane is achieved.

3,371,732
PNEUMATIC WEIGHT TRANSMITTER
Donald E. Stein, Millville, N.J., assignor to Kane Air Scale Company, Glassboro, N.J., a corporation of New Jersey
Filed June 30, 1966, Ser. No. 561,872
8 Claims. (Cl. 177—208)

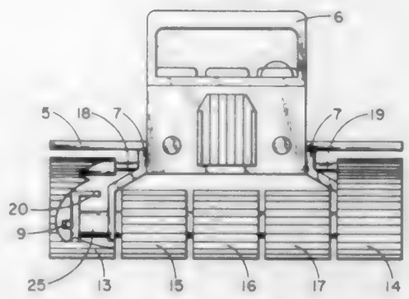


1. A pneumatic weight transmitter comprising a body having a weighing anvil connected to a tare weight diaphragm, said diaphragm partially defining a portion of a tare weight chamber, said body having a net load chamber partially defined by a net load diaphragm, at least two dampening chambers between said tare weight and net load chambers, said dampening chambers each being partially defined by an annular dampening diaphragm, a dampening medium in said dampening chambers, the outer peripheral portion of each dampening diaphragm being supported by a separate flange on the inner peripheral of said body, the inner peripheral of each dampening diaphragm being connected to a guide member, means defining an outlet flow passage from said net load chamber, a valve member in said net load chamber and supported by said net load diaphargm for controlling flow through said passage, means for introducing air at a constant flow into said net load chamber, said body having a vent chamber between one of said dampening chambers and said net load diaphragm, said vent chamber being partially defined by said net load diaphragm and being vented to atmosphere, and rigid means cooperating with said guide member and extending between said anvil and net load diaphragm, whereby force supplied to said anvil is transmitted by said rigid means to said net load diaphragm and balanced by the pressure in said net load chamber which is controlled by the relative position of said valve member with respect to said passage.

3,371,733
FULLY TRACKED VEHICLE
Paul Kehler, 6752 Sy Road, Niagara Falls, N.Y. 14304
Filed Aug. 30, 1965, Ser. No. 483,764
1 Claim. (Cl. 180—6.7)

A power driven vehicle having a plurality of side by side ground-engaging endless track members so that the entire lower surface of the vehicle is track-supported, with

drive means for the outer tracks and differential drive means for the inner tracks, the two outer tracks being independently power driven and the differential drive means causing each inner track to be driven at a speed intermediate the speeds of its two adjacent tracks.

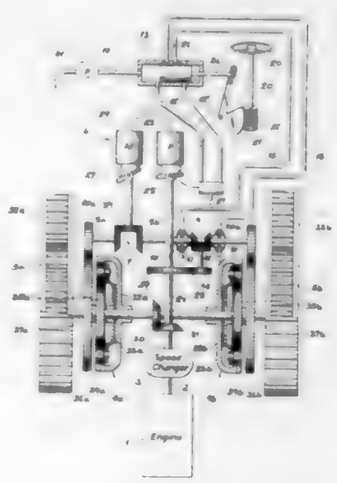


3,371,734

STEERING SYSTEM FOR ENDLESS-TRACK VEHICLES

Franz Xaver Zaunberger, Augsburg, and Artur Kugler, Hainhofen, Germany, assignors to Zahnraderfabrik Renk A.G., Augsburg, Germany, a corporation of Germany

Filed Sept. 8, 1966, Ser. No. 577,976
Claims priority, application Germany, Sept. 8, 1965, Z 11,747
8 Claims. (Cl. 180—6.44)



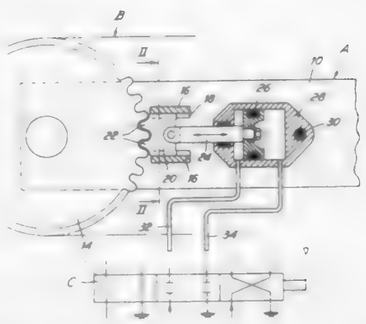
1. In a vehicle having a pair of endless tracks, in combination, a pair of drive shafts for said tracks; an engine; a steering device; a main shaft coupled with said engine; transmission means including a pair of differential gear trains for powering said endless tracks, each of said differential gear trains being provided with a first input connected to said main shaft, a second input, and an output connected to the respective drive shaft; two control shafts each connected to said second input of a respective differential gear train; a torque generator connected to said control shafts and responsive to said steering device for applying to said control shafts a reversible differential torque continuously variable in a range between zero and a predetermined maximum; a servo mechanism under the control of said steering device; and additional drive means responsive to said servo mechanism for applying to one of said control shafts a supplemental torque aiding said differential torque at least in the upper region of said range.

3,371,735

DEVICE FOR LOCKING TRACKED VEHICLES, IN PARTICULAR EXCAVATORS AND THE LIKE

Arturo Masera, Via Trieste 22, Piacenza, Italy

Filed Apr. 18, 1966, Ser. No. 543,338
Claims priority, application Italy, Apr. 24, 1965, 3,946/65
7 Claims. (Cl. 180—9.62)



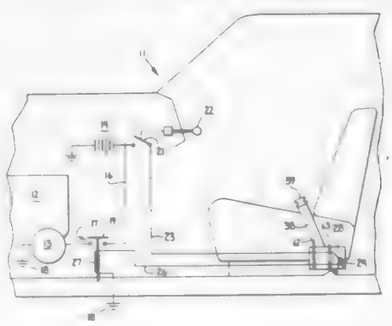
A locking device for a tracked vehicle wherein a slidable member is mounted in the frame and guided for movement toward and away from the driving gear wheel in a direction generally radially of the wheel. The slidable member has a tooth structure on its one end for moving into mesh relationship with the teeth of the gear wheel when moved in one direction and out of mesh with the gear wheel when moved in the other direction. A hydraulic system is provided to drive the slidable member.

3,371,736

SAFETY BELT SYSTEM

Fred I. Lewis, 2810 E. 10th St. 46017, and Gene Richard Jack, 1418 Cottonwood Drive 46012, both of Anderson, Ind.

Filed Dec. 8, 1965, Ser. No. 512,453
3 Claims. (Cl. 180—82)



A spring wound safety belt retractor spool for retracting a belt by winding thereon. A cam mounted on a screw threadedly received by the spool for linear movement of the cam by rotation of the spool. A switch having an operating arm movable by the cam to open the switch when the belt is wound on the spool.

3,371,737

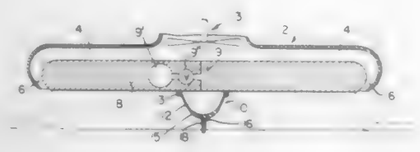
CONTROLLED HEIGHT AERODYNAMIC AND HYDRODYNAMIC BAFFLES FOR AIR CUSHIONED VEHICLES

Arnold M. Hall, Noank, Conn., assignor to General Dynamics Corporation, New York, N.Y., a corporation of Delaware

Filed Oct. 1, 1964, Ser. No. 400,664
10 Claims. (Cl. 180—117)

1. In an air levitated vehicle supported by a peripherally confined fluid cushion, the improvement comprising

at least one laterally disposed baffle extending downwardly from said vehicle for lateral control of the fluid cushion, said baffle comprising a rigid lower portion and a flexible upper portion including an inflatable pod fixed to said vehicle and normally in a contracted position said pod being of trough configuration opening upwardly in a continuous edge secured to the vehicle and terminating downwardly in a surface adapted to contiguously join said rigid lower portion, a source of pressurized fluid and

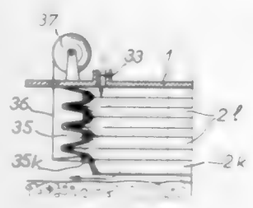


means to convey and regulate the amount of fluid introduced into said pod so as to control the lateral expansion of said pod as a control of pitch and roll, together with tension means compressing said pod and elevating said lower portion of said baffle upon reduction of pressure within said pod, said tension means being located entirely within said pod and operatively coupling the vehicle and the lower surface of said pod.

3,371,738
SURFACE EFFECT DEVICES WITH SKIRT HEIGHT ADJUSTING MEANS

Jean H. Bertin, Neuilly-sur-Seine, France, assignor to Societe Bertin & Cie, Paris, France, a company of France

Original application Jan. 11, 1962, Ser. No. 165,634, now Patent No. 3,263,764, dated Aug. 8, 1966. Divided and this application Oct. 20, 1965, Ser. No. 498,315
Claims priority, application France, June 30, 1961, 80,047
5 Claims. (Cl. 180—127)

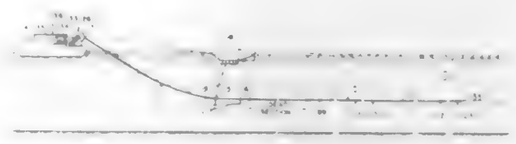


1. A fluid cushion skirting system for a movable body of the ground effect type having a support frame spaced from a bearing surface along which said body is designed to move, and a skirt free edge positioned in operation adjacent to but clear of said bearing surface to define therewith an operative leakage gap between an inner pressure fluid cushion and an outer lower pressure fluid medium and forming the periphery of an orifice opening extending in close proximity to said bearing surface, wherein the improvement comprises a supple fluidtight skirt body portion carried by said support frame and laterally bounding a cavity for confining said pressure fluid cushion and extending for substantially its full length outwardly from said support frame toward said bearing surface and terminating in said skirt free edge, said skirt body portion being at least partly contractible toward and expansible away from said support frame, and selectively operable, skirt body control means for selectively adjustably contracting or expanding at least a part of said skirt body portion whereby the operative length of said part is adapted to be varied to permit the position of said support frame relative to said bearing surface to be varied while keeping said skirt free edge in proximity to said bearing surface whereby leakage from said cushion to said outer fluid medium is minimized and whereby damage to the body structure is avoided.

3,371,739
MEANS FOR VARIABLY CONTROLLING THE BUOYANCY OF A SEISMIC DETECTION STREAMER

Raymond H. Pearson, Richardson, Tex., assignor to Whitehall Electronics Corporation of the First Bank & Trust Building, Richardson, Tex.

Filed May 23, 1966, Ser. No. 552,098
22 Claims. (Cl. 181—.5)

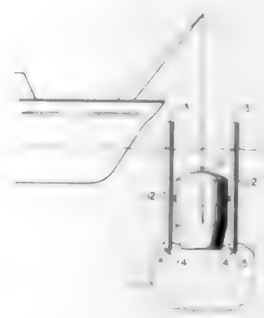


A buoyancy control system for an expansible detection streamer comprising a plurality of serially connected oil filled sections, each containing a plurality of wave detectors therein for transmitting electrical seismic signals over a two conductor channel to a vessel while the streamer is towed thereby, each section having an oil line including a normally closed electrically operated inlet valve connected to a pressurized oil source on the vessel, a second normally closed electrically operated valve operable to exhaust oil from the section, a depth actuated transducer within each section connected by the channel to control apparatus on the vessel and effective during a towing operation to operate the inlet and exhaust valves selectively to maintain each section at a constant fixed depth of submersion.

3,371,740
SYSTEM AND METHOD FOR REDUCING SECONDARY PRESSURE PULSES IN MARINE SEISMIC SURVEYING

George B. Loper, Dallas, Tex., assignor to Mobil Oil Corporation, a corporation of New York

Continuation of application Ser. No. 353,874, Mar. 23, 1964. This application Aug. 22, 1966, Ser. No. 574,244
14 Claims. (Cl. 181—.5)



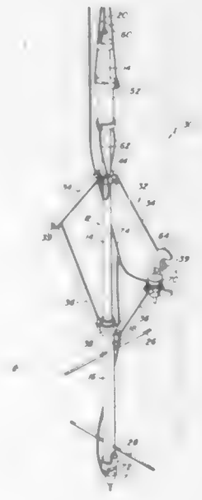
The specification discloses an arrangement in combination with a marine seismic source for reducing secondary pressure pulses caused by the oscillation of a bubble formed in the production of a seismic disturbance in water. A plurality of conduits is provided, each having

an upper end extending to the surface and open to the atmosphere. The other ends of the conduits are located in water below the surface near the source and are positioned to be within the bubble formed upon the generation of the seismic disturbance. Valves are provided for normally closing the lower ends to maintain the conduits substantially free of water. The valves open when encompassed by the bubble to reduce secondary pressure pulses.

3,371,741
GEOPHYSICAL EXPLORATION INSTRUMENT SUPPORT

Ronald L. Haxby, Tucson, Ariz.
(1421 Oxford Road, Maitland, Fla. 32751)

Filed Oct. 5, 1966, Ser. No. 584,529
7 Claims. (Cl. 181—.5)



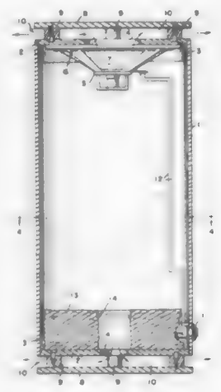
1. A positioning frame for supporting geophysical exploration instruments and the like in a bore hole comprising a mandrel adapted to be supported from above ground, a radially expansible anchor means carried by said mandrel, said anchor means including a plurality of articulated anchor arms, means pivotally securing one end of each articulated anchor arm to said mandrel, collar means carried by said mandrel for pivotally and slidably securing the other end of each of said arms to said mandrel whereby longitudinal sliding movement of said collar means along said mandrel radially expands and contracts said anchor means into and out of stabilizing contact with the bore hole wall, and anchor arm actuating means slidably carried by said mandrel and adapted to be operated from above ground to selectively expand or contract said radially expansible anchor means.

3,371,742
SPEAKER ENCLOSURE

Desmond H. Norton, 1122 Patterson St., Ogden, Utah 84403, and Martin A. Hardin, 1790 South 50th West, Bountiful, Utah 84010

Filed Oct. 21, 1965, Ser. No. 499,449
5 Claims. (Cl. 181—31)

1. An acoustical enclosure for a loudspeaker comprising an elongated hollow body portion, a first sounding wall closing one end of said hollow body portion, a loudspeaker having an outwardly flaring speaker cone supported by said first sounding wall interior of said hollow body portion in registration with a central aperture in said first sounding wall, which aperture is smaller than the diameter of the speaker cone of said loudspeaker, wherein said sound waves are directed outwardly through said central aperture, a second sounding wall closing the opposite end of said hollow body portion and having a central aperture, smaller than said aperture in said first sounding wall, axially aligned with said loudspeaker and the central aperture in said first sounding wall to direct sound waves from the back of the speaker cone outwardly of said hollow body portion, and a pair of baffle members respectively connected in outwardly spaced relation with

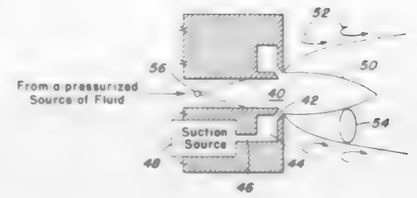


said first and second sounding walls at opposite ends of said hollow body portion, whereby said apertured first and second sounding walls and baffle members acting in combination with said loudspeaker are adapted to produce omnidirectional sound propagating patterns from opposite ends of said hollow body portion in planes substantially normal to the axis of said hollow body portion.

3,371,743
JET EXHAUST SILENCING NOZZLE WITH SUCTION APPLIED AT EXIT WALL

Robert Charles Chanaud, Somerville, and Gunnar Heskestad, East Brunswick, N.J., assignors to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware

Filed Apr. 29, 1965, Ser. No. 451,714
5 Claims. (Cl. 181—35)



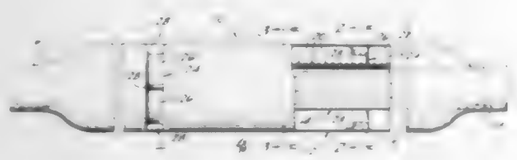
This invention relates to a relatively simple and inexpensive arrangement for reducing noise which arises from the expulsion of a high velocity jet of fluid from the nozzle of an aircraft. This is accomplished by applying suction to a narrow slot at the periphery of the nozzle at the very point at which the high velocity jet emerges from the nozzle of the jet engine and enters the free space immediately outside the jet engine. By employing a narrow annular slot making a substantial angle with respect to the direction of the jet expulsion path, there will be a spreading of the jet upon emergence from the nozzle, a rapid reduction in the jet velocity at the exit, an appreciable increase in the size of the eddies, a large reduction in the eddy velocity and a large and significant

reduction in the sound power produced beyond the nozzle exit.

3,371,744
MUFFLER WITH SEMI-CHAMBERS FORMED BY REDUCED SHELL PORTIONS

Eldred G. Straw, Grass Lake, Mich., assignor to Walker Manufacturing Company, Racine, Wis., a corporation of Delaware

Filed Mar. 5, 1965, Ser. No. 437,428
2 Claims. (Cl. 181—61)

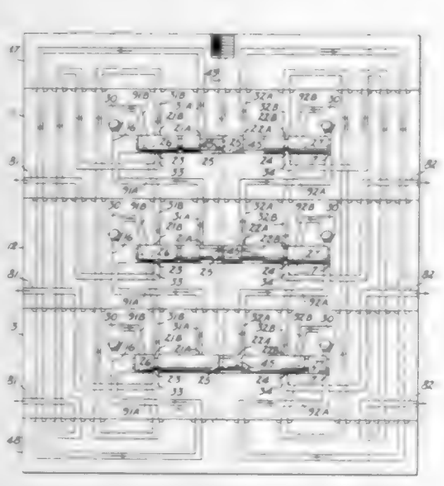


A muffler shell is strengthened and made effective as a silencing device by pinching sections together to form a sereis of inwardly extending embossments.

3,371,745
UNIDIRECTIONAL-FLOW LUBRICATING MEANS

James J. Callahan, Mentor, and Robert A. Shivak, Parma, Ohio, assignors to Trabon Engineering Corporation, Solon, Ohio, a corporation of Ohio

Filed Mar. 11, 1964, Ser. No. 350,981
22 Claims. (Cl. 184—7)

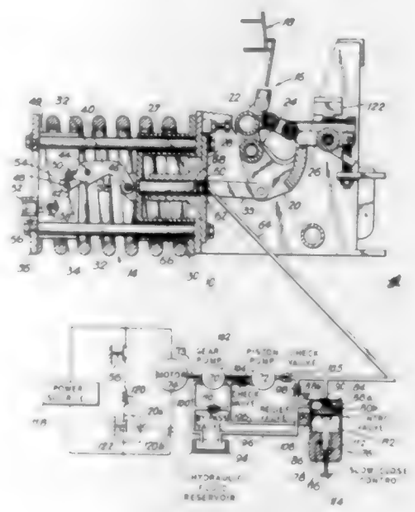


1. In a single-line series or sequential type lubricant distributor for a lubrication system that supplies lubricant from a supply source to several stations and proportions the supplied lubricant between the several stations, the system having lubricant branch lines that communicate between the distributor and the stations to be lubricated, and wherein interconnections between valve means of each valve-and-plunger unit of the distributor and piston chambers of another valve-and-plunger unit of the distributor are accomplished through conduit means leading from unit to unit, said interconnections being for cyclical sequential operation of said units of the distributor and discharge of measures of lubricant to the branch lines, the improvement wherein, at least as to the longest of all of said unit-to-unit interconnecting conduit means of the distributor, in one unit said conduit means are wholly constituted by unidirectional-flow conduits and in another unit are at least partly constituted by unidirectional-flow conduits forming continuations of the first-mentioned unidirectional flow conduits.

3,371,746
ENERGY STORAGE MECHANISM FOR ACTUATING CIRCUIT BREAKERS AND THE LIKE

Edward I. Engel, Matawan, N.J., assignor to Federal Pacific Electric Company, a corporation of Delaware

Filed July 26, 1966, Ser. No. 567,960
6 Claims. (Cl. 185—37)

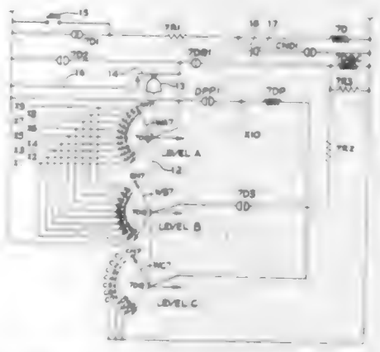


1. A stored energy mechanism for operating a circuit breaker including spring means for storing the operating energy, said spring means defining a given volume in the discharged position thereof, means for transmitting to said spring the energy to be stored in said spring in response to externally generated forces, means for releasably restraining said spring means in the charged position thereof, and means for releasing the restraining means, said energy transmitting means, said releasable restraining means, and said releasing means being mounted within said given volume of said spring means, and means operatively connecting said spring means to the circuit breaker for the operation thereof.

3,371,747
PRIORITY CALL CONTROL FOR AN ELEVATOR SYSTEM

John A. Gingrich and Gordon A. Holland, Toronto, Ontario, Canada, assignors, by mesne assignments, to Dover Corporation, New York, N.Y.

Filed June 12, 1964, Ser. No. 374,608
7 Claims. (Cl. 187—29)

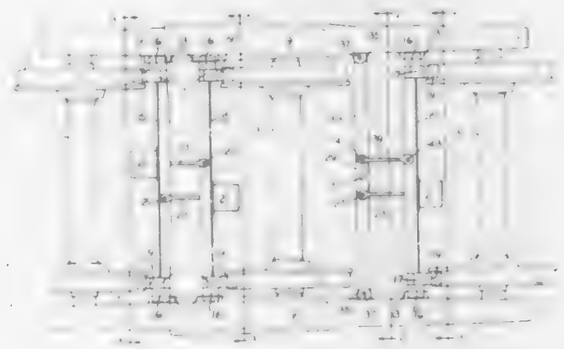


An elevator dispatching and control system in which a predetermined number of calls are selected as priority calls and cars are assigned on a rotational basis to these priority calls. The assigned cars stop and reverse direction at the selected priority calls and the priority of all calls with lower priority than an answered call is advanced when the answered call is cancelled.

3,371,748
BRAKE FOR SIX-WHEEL TRUCKS

James B. Cunningham, Northwoods, and Richard L. Lich, Pasadena Hills, Mo., assignors to General Steel Industries, Inc., Granite City, Ill., a corporation of Delaware

Filed July 5, 1966, Ser. No. 562,833
9 Claims. (Cl. 188—47)

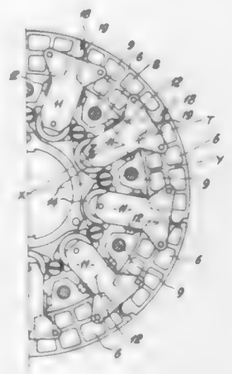


Single-shoe brake apparatus of the beam-mounted cylinder type for six-wheel railway trucks in which the end axle brake shoes are mounted on brake beams inboard of the end axles and a single pair of brake shoes for individual engagement each with one of the middle axle wheels is mounted on structure comprising a pair of beams, one of which is positioned on each side of the middle axle. In one form of the invention both of the middle axle shoes are mounted on one of the middle axle beams and the other middle axle beam is entirely unshod and is fixed at both ends to the truck side frames. In the other disclosed embodiment, each of the middle axle beams has a shoe at one end only, and the other unshod end of each middle axle beam is pivoted to the side frame.

3,371,749
SEGMENTED DISC BRAKE

Rene Lucien, Neuilly-sur-Seine, and Jean Masclet, Paris, France, assignors to Recherches Etudes Production R.E.P., Paris, France

Filed Apr. 20, 1966, Ser. No. 545,216
10 Claims. (Cl. 188—71)

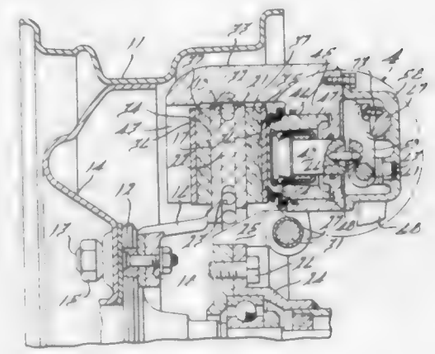


A disc brake having a first rotating unit including at least one braking disc, a second non-rotating unit having a plurality of small individual shoes mechanically independent of each other, each shoe carrying a friction lining which is intimately associated with it without any thermal discontinuity, and a third supporting unit coupling the second unit to the wheel axle thermally distant from the second unit and including actuating means for the shoes.

3,371,750
DISK BRAKE WITH AUTOMATICALLY ADJUSTED MECHANICAL ACTUATOR

Daniel A. Schutte, Carl A. Nafz, and John W. Carlisle, Springfield, Ohio, assignors to Kelsey-Hayes Company, a corporation of Delaware

Filed Aug. 22, 1966, Ser. No. 574,504
5 Claims. (Cl. 188—73)

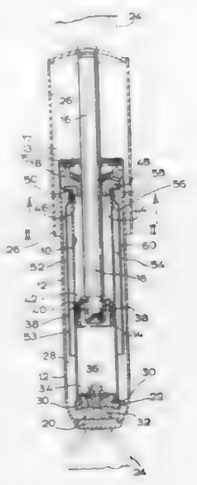


A brake disk is straddled by the legs of a caliper which is pivotally mounted to shift laterally thereof. Brake pads on each side of the disk are moved thereagainst with light pressure when a piston and cylinder in one leg of the caliper engages one of the pads and moves it toward the disk. A plunger in the piston has locking means which limit the retraction of the cylinder and caliper to take up wear on the pads. The plunger is operated manually by a device supported on the pivoted caliper.

3,371,751
TELESCOPIC HYDRAULIC SHOCK ABSORBERS

Ronald Sidney Dickinson, Osbaldwick, York, England, assignor to Armstrong Patents Co. Limited, London, England, a British company.

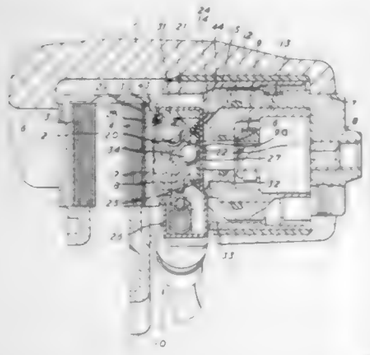
Filed Oct. 19, 1965, Ser. No. 497,923
Claims priority, application Great Britain, Oct. 20, 1964, 42,641/64
3 Claims. (Cl. 188—88)



This invention concerns a tubular hydraulic shock absorber for use in automobiles and employs a valved piston displaceable in an inner hydraulic pressure cylinder closed at each end by means including one-way valve means so arranged that hydraulic fluid is always moved in the same direction through the pressure cylinder irrespective of the direction of piston displacement. The pressure

cylinder is surrounded by a coaxially arranged outer cylinder which co-operates with the pressure cylinder to define an annular space acting as a reservoir for hydraulic fluid and from the end of the pressure cylinder at which hydraulic fluid is discharged into the reservoir there extends into the reservoir space, a cylindrical shroud arranged in close-spaced relation to the outer cylinder to inhibit foaming in the fluid by confining it to a long and narrow flow path. The manufacture of the shock absorber is simplified by making all the valve means in the form of diaphragm valves and the damping characteristics of the shock absorber are determined by pretensioning the diaphragm of at least one of the valve means.

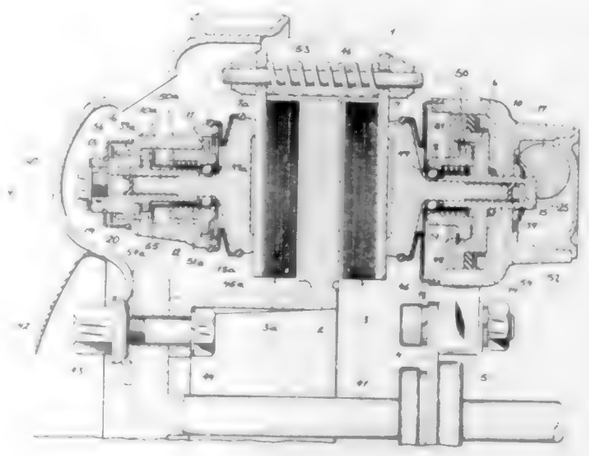
3,371,752
CAPSULED ACTUATOR FOR DISC BRAKES
Juan Belart, Walldorf, Fritz Ostwald, Buchschlag, and Karl Schlör, Biebesheim, Germany, assignors to Dunlop Rubber Company Limited, Erdington, England, a corporation of Great Britain
Filed Mar. 1, 1965, Ser. No. 435,919
8 Claims. (Cl. 188—106)



1. An operating mechanism for a disc brake having a hydraulic actuator, and comprising an expander device disposed between said hydraulic actuator and the disc portion of said disc brake to provide a thrust connection therebetween, means forming a sealed capsule which surrounds said expander device and which can be inserted in and removed from the associated brake structure as a unit, said capsule having opposite end walls which are relatively axially movable to provide expansion of said expander device to effect brake operation independently of said hydraulic actuator.

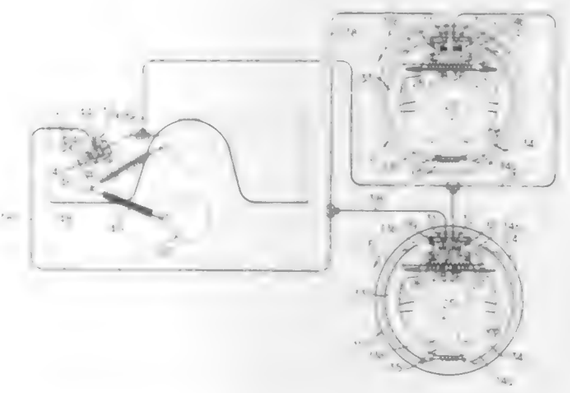
3,371,753
HYDRAULIC QUICK-SLACK-TAKE-UP PULSATOR FOR DISK BRAKES
Ernst Meier, Frankfurt am Main-Sindlingen, Germany, assignor to Alfred Teves, Frankfurt am Main, Germany, a corporation of Germany
Filed Aug. 15, 1966, Ser. No. 601,501
Claims priority, application Germany, Aug. 14, 1965, T 29,212
14 Claims. (Cl. 188—152)

1. In a hydraulic disk brake, in combination, a disk rotatable about its axis and coupled with a mass to be decelerated; support means adjacent said disk; a housing on said support means froming at least one fluid chamber; first and second brake shoes on said support bracketing a peripheral zone of said disk, at least said first brake shoe being movable with reference to said support means; a cylinder carried by said support means; a main piston with a relatively large working face in said cylinder; an auxiliary piston with a relatively small working face in said chamber and with a contact surface adjacent said first brake shoe for driving same into engagement with said disk; unidirectionally effective coupling means between said pistons; and fluid-source means connectable with said chamber and said cylinder for substantially concurrently applying a hydraulic liquid under pressure to both said working faces for operatively displacing said secondary piston toward said disk and said main



piston in a direction transmitting an aiding hydraulic pressure to said secondary piston through said coupling means, said coupling means enabling limited relative reverse motion of said pistons for facilitating separation of said first brake shoe from said disk by a withdrawal of said contact surface upon release of fluid pressure in said cylinder and said chamber.

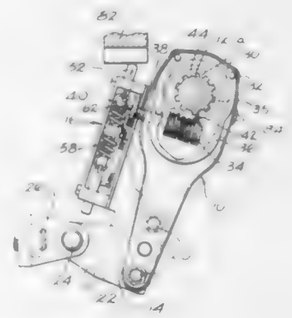
3,371,754
LOAD RESPONSIVE BRAKE SYSTEM
Pierre André Georges Lepelletier, Chatou, France, assignor to Societe Anonyme Francaise du Ferodo, a corporation of France
Filed Dec. 27, 1965, Ser. No. 516,576
Claims priority, application France, Jan. 11, 1965, 1,440
6 Claims. (Cl. 188—195)



A hydraulic brake for an automotive vehicle has a pair of brake shoes swingable in opposite directions under the influence of separate pistons and pressure chambers, so that the upstream end of one shoe (relative to the direction of rotation of the member to be braked) comes into firmer engagement with the rotatable member than its downstream end, while the downstream end of the other shoe comes into firmer engagement with the member to be braked than does its upstream end. A pressure

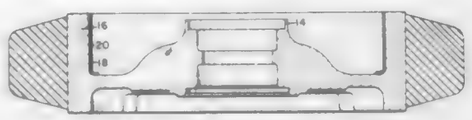
limiter is placed in the hydraulic supply to the first-mentioned shoe, but not in the supply to the second mentioned shoe, because the first-mentioned shoe is the one that tends to cause the brake to lock, particularly under light load. The pressure limiter is made load responsive by a special spring arrangement.

3,371,755
BRAKE ADJUSTER
James W. Leeper, Philadelphia, Pa., assignor to Eaton Yale & Towne Inc., Cleveland, Ohio, a corporation of Ohio
Filed June 21, 1966, Ser. No. 559,244
3 Claims. (Cl. 188—196)



An automatic brake adjuster for cam operated vehicle brakes actuated by a lever arm. A spring biased bar is slideable on a housing attached to the arm, and brake lining wear is sensed by the bar by engagement with an abutment on the vehicle axle. The slide bar carries a spring biased pawl which actuates a ratchet wheel to change the relative position of the cam shaft upon release of the brakes.

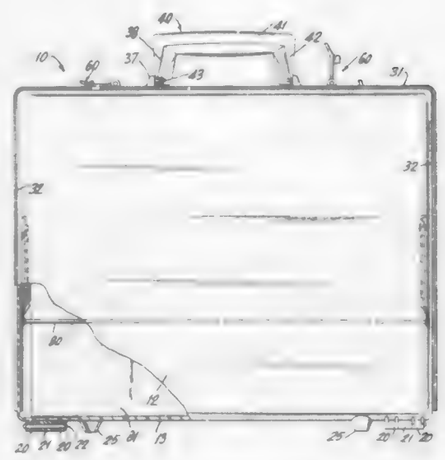
3,371,756
HEAT DISSIPATING BRAKE
Albert W. Spitz, 835 Glenside Ave., Wyncote, Pa. 19095
Filed Jan. 18, 1966, Ser. No. 536,241
2 Claims. (Cl. 188—251)



A heat dissipating brake including an aluminum or aluminum alloy rim, said rim having a brake drum formed therein, and said brake drum being hard anodized to provide a finished brake drum coating of thickness between 0.002 inch and 0.005 inch.

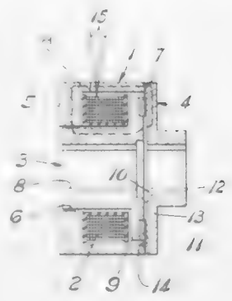
3,371,757
ATTACHE CASES AND THE LIKE CONTAINERS
Harry Jamison, Beechhurst, and Ralph M. Verni, Baldwin, N.Y., assignors to The Jamison Plastic Corporation, North Bellmore, N.Y., a corporation of New York
Filed June 28, 1966, Ser. No. 561,276
11 Claims. (Cl. 190—49)

1. A case comprising a pair of case sections, each having an outer wall, top and bottom walls extending therefrom, and end walls extending from said outer wall and connecting said top and bottom walls, hinge sleeves integrally formed with said bottom walls, the hinge sleeves of one case section registering with and being coaxial with hinge sleeves of the other case section, the axis of said sleeves being disposed below said bottom walls and in a vertical plane passing between said sections when the case is closed, hinge pins passing through said registering sleeves, a bezel having a top portion and downwardly extending side arm portions and formed with grooves on opposite sides, the end edges of the top and end walls of one case section being received in the groove of one side



of the bezel and fixed thereto throughout the length of the bezel, and the end edges of the top and end walls of the other case section being adapted to snugly fit into the groove on the opposite side of said bezel when the case sections are closed, said case sections being capable of being molded from a common mold, and said bezel being symmetrical about a vertical plane passing through its longitudinal midsection.

3,371,758
MAGNETICALLY OPERATED FRICTION CLUTCH
Don E. Stuhlmiller, Kenmore, N.Y., assignor to General-Electro Mechanical Corporation, Buffalo, N.Y.
Filed Mar. 14, 1966, Ser. No. 537,038
2 Claims. (Cl. 192—84)



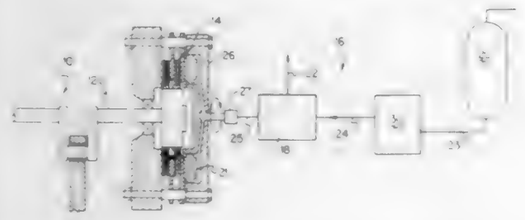
A magnetic clutch having a hollow cylindrical casing with an annular wall at one end thereof defining a recess for a magnetic winding. A rotatably driven member of magnetic material passes through the annular wall and together with the casing forms a U-shaped flux path for the winding. A driven member has a flat radial face in close juxtaposition to the end of the casing opposite to the annular wall and to adjacent end of the driving member, and the adjacent end of the driving member has an outward annular flange carrying friction material for clutching engagement with the face of the driven member when the latter is attracted electromagnetically.

3,371,759
CLUTCH CONTROL FOR MECHANICAL DEVICES

Roger Sapolsky, Saint-Gratien, France, assignor to E. W. Bliss Company, Canton, Ohio, a corporation of Delaware

Continuation-in-part of application Ser. No. 467,288, June 28, 1965. This application Feb. 7, 1967, Ser. No. 629,044

11 Claims. (Cl. 192—85)



This disclosure concerns a torque control mechanism for a fluid operable clutch such as may be found in a crank-driven press, which mechanism includes a valve to selectively connect the clutch to a source of fluid pressure or to a fluid pressure escapement and in series between the valve and pressure source, a pressure modulating valve retarding build-up of pressure in the clutch at the start causing gradual clutch engagement and thereafter responsive to a predetermined back pressure to permit a rapid rise of pressure in the clutch to prevailing line pressure and full engagement torque.

3,371,760
COORDINATED MECHANISM

Jasper Willsea, 430 Lake Road, Webster, N.Y. 14580; Norma Julia Willsea, executrix of said Jasper Willsea, deceased

Original application July 15, 1963, Ser. No. 294,862. Divided and this application Oct. 21, 1966, Ser. No. 591,943

5 Claims. (Cl. 192—142)

A coordinated mechanism that is controlled numerically and is entirely electrical. The extent of a movement or a dwell is controlled by counting precise displacement units. Pulses representing the units are counted. When the counted units are equal to the preset number of the desired extent, the movement or dwell is switched off and another movement or dwell is switched on. Displacement units are transduced during a movement from a driven shaft, and during a dwell from a block shaft.

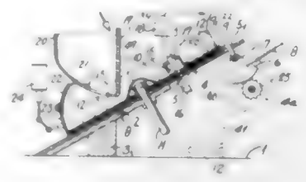
A programming by a sequence of preset count numbers in count-switches can be modified instantly by a resetting of the preset count number in the respective count-switch during an operation and without any mechanical adjustment. A preset count number in a count-switch can be reset from an external remote source.

3,371,761
APPARATUS FOR DISCRIMINATING HARD COINS

Ryo Hirano, 849 Tsu, Kanagawa, Kamakura, Japan

Filed May 4, 1966, Ser. No. 547,540

1 Claim. (Cl. 194—16)



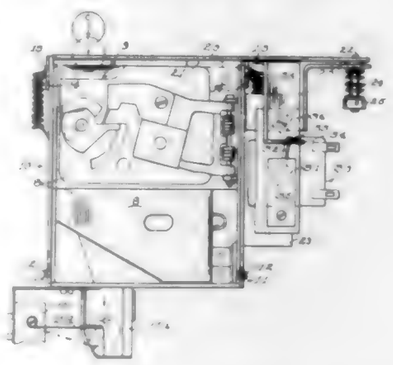
A T-shaped lever for mechanically amplifying a slight difference in the diameters of different sized coins is used to discriminate continuously and at high speed between a large number of coins. Phototransistors are used in the same number as the kinds of coins to be discriminated and corresponding apertures are formed in the lever. Only when one of these apertures conforms with a light transmitting aperture in a fixed plate and light sensing aperture in a rotatable plate is one of these phototransistors energized and which corresponds to the coin being discriminated.

3,371,762
COIN CHUTE WIRE LOCKOUT AND CONTROL

Joseph L. Isaacson, New Orleans, La., assignor, by mesne assignments, to Lion Manufacturing Corporation, Chicago, Ill., a corporation of Illinois

Filed Sept. 17, 1965, Ser. No. 488,084

8 Claims. (Cl. 194—97)



A blocking lever is pivoted on a cradle to move across the entrance to the coin chute seated therein to block the same and bend to one side any wire or like probe or tether on a captive coin responsive to action of an electromagnet responsive to any operation of the coin switch located further along the chute passage. Supplement to the subject: the blocking lever is both pivotable and axially shiftable and is mounted on the cradle by which the coin testing chute is removably supported; and the blocking lever can be shifted axially against spring tension out of the way of the chute for removal thereof from the cradle and for uncoupling with the electromagnetic means.

3,371,763
COIN CHUTE ANTITHEFT DEVICE

Mitchell Adam Hall, 445 Rossford Ave., Fort Thomas, Ky. 41075

Filed Feb. 9, 1967, Ser. No. 614,866

17 Claims. (Cl. 194—97)

The coin chute includes simple means for gradually reducing clearances between a coin slide and its supporting passageway, to bind and immobilize any shim employed in an attempt to obtain fraudulent free play or illegitimate dispensation of goods or services from a dispensing machine controlled by the coin chute. Extreme clearance reduction occurs only momentarily, so that the slide normally moves freely through the major portion

of its stroke, even in the presence of accumulated dirt, gum and other foreign materials. Insertion of a shim and concurrent advancement of the slide immobilizes the shim against maneuverability.

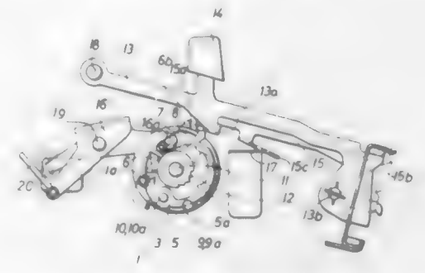
3,371,764
POWER ROLL COUPLING CAM

Manfred Aden, Sande, and Kurt Chvatlinsky, Wilhelmshaven, Germany, assignors to Olympia Werke A.G., Wilhelmshaven, Germany

Filed Oct. 3, 1966, Ser. No. 583,705

Claims priority, application Germany, Oct. 2, 1965, O 8,420

8 Claims. (Cl. 197—17)



A coupling for connecting the toothed power roll of a typewriter with a movable element for actuating the same as an integral body consisting of a synthetic plastic material and having on one side a cam portion for operating a movable element of the typewriter, and on both sides integral journals for pivotally supporting coupling means cooperating with the teeth of the power roll so that noise produced by the impact of the teeth of the power roll on the coupling means is produced by the plastic synthetic material of the integral body.

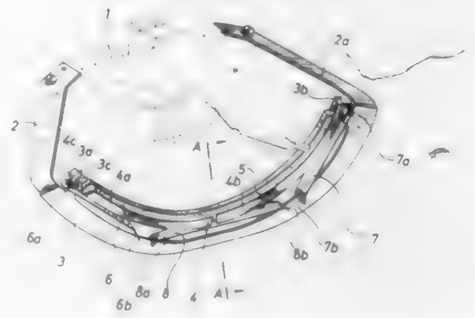
3,371,765
TYPE BAR REST HAVING PLURAL PARTS RESILIENTLY AND INDEPENDENTLY SUPPORTED

Kurt Chvatlinsky and Wolfgang Bonleitner, Wilhelmshaven, Germany, assignors to Olympia Werke A.G., Wilhelmshaven, Germany

Filed Jan. 30, 1967, Ser. No. 612,552

Claims priority, application Germany, Feb. 4, 1966, O 8,595

10 Claims. (Cl. 197—42)



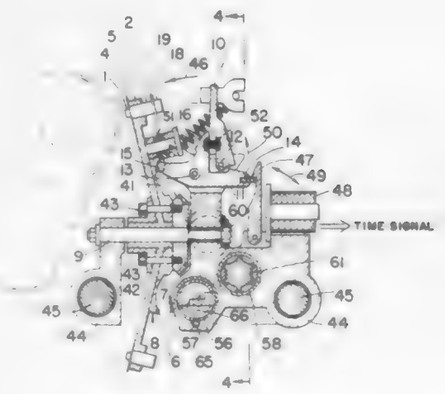
The back rest of the type bars of a typewriter is formed of two arcuate parts flexibly connected by an arcuate damping member and supported by leaf springs sliding on the same and on supporting means which have projections located in cutouts in the outer ends of the arcuate parts and of two outer leaf springs.

3,371,766
PRINTING APPARATUS

Karel J. Staller, Rutherford, N.J., assignor to International Telephone & Telegraph Corporation, Nutley, N.J., a corporation of Maryland

Filed July 18, 1966, Ser. No. 565,933

10 Claims. (Cl. 197—53)



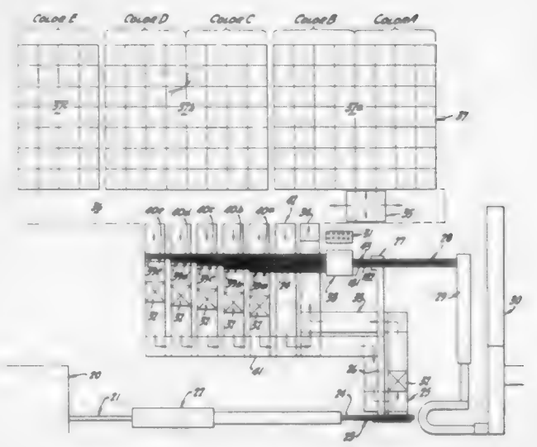
A serial printer having a continuous motion carriage and letter carrier, the letter carrier being in the form of a spinning disc which permits the printing of any character on its circumference. The character is struck by a hammer which is released by an electromagnet.

3,371,767
COLOR SELECTOR MECHANISM AND METHOD

Henry W. Rehr, Concord, Lawrence E. Weinert, Antioch, and James B. Cole, Mercer Island, Calif., assignors to Crown Zellerbach Corporation, San Francisco, Calif., a corporation of Nevada

Filed July 1, 1966, Ser. No. 562,204

32 Claims. (Cl. 198—30)



Mechanism for and method of selecting predetermined numbers of facial tissue cartons respectively containing tissue of one of a plurality of colors from a greater plurality of cartons of each such color so that mixed-lot

cases comprising cartons of each such color can be packaged. The mechanism includes a plurality of parallel tracks, one for each color, along which the cartons of tissue are advanced. Rails defining each such track are periodically opened to permit cartons supported thereon to pass downwardly therebetween. However, retainers located along each track are operative to prevent certain of the cartons advanced therealong from passing downwardly between the open rails. Accordingly, a lesser number of cartons of each such color are selected from the greater plurality thereof for assembly and packaging into a mixed-lot case. The method involves the steps of advancing cartons of each such color into a selection station, displacing such lesser number of cartons of each color from the selection station and assembling the displaced cartons for packaging thereof in such mixed-lot cases.

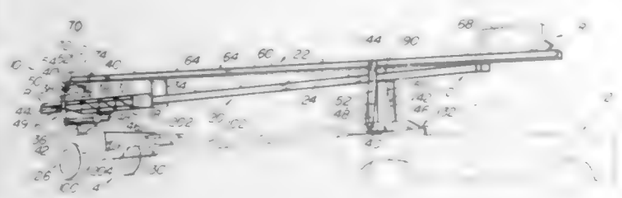
3,371,768

CONVEYOR CONSTRUCTION

Robert F. Oury, Wayne, and John F. Oury, deceased, late of Wheaton, Ill., by Alice M. Oury, executor, Wheaton, Ill., assignors to Oury Engineering Company, Elmhurst, Ill., a corporation of Delaware

Continuation-in-part of application Ser. No. 575,503 Aug. 25, 1966. This application Oct. 17, 1966, Ser. No. 587,344

12 Claims. (Cl. 198—92)



A mobile trailer assembly adapted to support a feeding conveyor and distributing conveyor features a frame mounting yoke mounted at one end of the trailer assembly and adapted for rotational movement about a vertical axis. A support frame assembly is mounted in cantilever fashion adjacent one of its ends on the frame mounting yoke and is adapted for movement about a horizontal axis. The distributing conveyor is mounted on rollers carried by the frame mounting means for controlled longitudinal movement such that concrete mix and the like may be discharged from the distributing conveyor without supporting the discharge end thereof. During the distributing mode of operation, one end of the feeding conveyor is pivotally mounted above the distributing conveyor, and the opposite end is supported by upstanding brackets located on the trailer assembly. During the transport mode of operation, both the feeding and distributing conveyors are supported by the upstanding brackets.

3,371,769

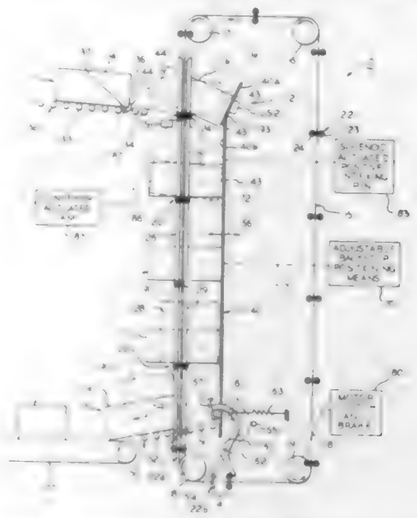
ELEVATOR CONVEYOR

Robert L. Beninger, Sheboygan, Wis., assignor to H. G. Weber and Company, Inc., Kiel, Wis., a corporation of Wisconsin

Filed Oct. 27, 1965, Ser. No. 505,323

15 Claims. (Cl. 198—154)

An elevator conveyor for receiving articles at one level and discharging the articles at another level. The elevator conveyor includes a series of article supports secured to the conveyor and movable therewith, and a backstop positioned relative to the article supports to form together



with the article support means for balancing the article on the support en route from one level to another level.

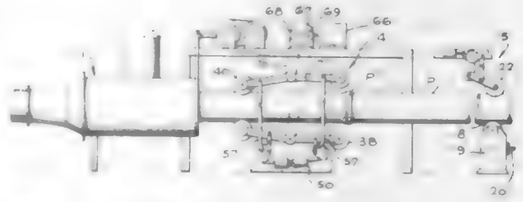
3,371,770

APPARATUS FOR MOVING PIPE THROUGH A COATING MACHINE

Gordon C. Graham, Glendora, and Constantinos E. Zervos, Los Angeles, Calif., assignors to American Pipe and Construction Co., Monterey Park, Calif., a corporation of California

Filed Oct. 25, 1966, Ser. No. 589,453

10 Claims. (Cl. 198—167)



The application discloses sets of retractable power-driven rollers for supporting and advancing a pipe through coating apparatus and means for selectively retracting the rollers of the sets of rollers to pass enlarged sections of the pipe while holding the pipe and continuing to advance it with the remaining sets of rollers.

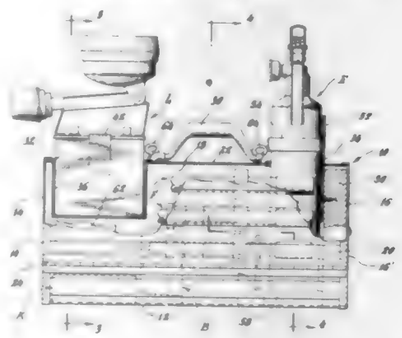
3,371,771

EMERGENCY SAFETY KIT

Edward T. Bugyi, 190 Knollwood Drive, Stratford, Conn. 06497

Filed June 29, 1966, Ser. No. 561,604

7 Claims. (Cl. 206—16)



An emergency kit of generally rectangular cross section having a hinged front with the hinge displaced upwardly from the bottom edge to form a tray when the kit is open. A receptacle is built into the top of the kit to receive an article, such as a lantern. An opening in the case receives a fire extinguisher which is secured by a bracket and strap.

3,371,772

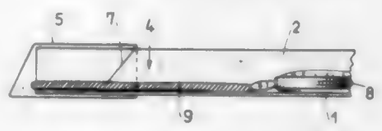
PACKAGE FOR THE TRANSPORT AND DISPLAY OF AT LEAST ONE WRISTWATCH

Marcel Fontannaz, Echandens, Switzerland, assignor to Cartolux S.A., Echandens, Vaud, Switzerland, a corporation of Switzerland

Filed Mar. 14, 1967, Ser. No. 623,120

Claims priority, application Switzerland, Mar. 14, 1966, 3,740/66; Oct. 14, 1966, 15,079/66, 15,080/66; Jan. 13, 1967, 742/67; Feb. 7, 1967, 1,959/67

17 Claims. (Cl. 206—45.14)



A package for a wristwatch in which the watch is supported in a channel of an elongated element and the strap segments of the watch are held in place by depending wall portions of cap elements which are supported by the elongated element at the ends thereof. The assembly of the elongated element and the cap elements is replaceably covered by a cover element.

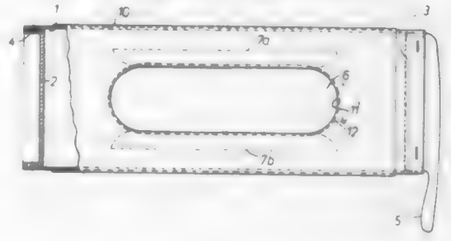
3,371,773

CONTAINERS

Carl Hermann Flisch, Aeuli, Maienfeld, Graubunden, Switzerland

Filed Aug. 17, 1966, Ser. No. 573,069

9 Claims. (Cl. 206—45.31)



A container having an inner shell mounted in a rotatable outer jacket, the shell and jacket having openings in the sides thereof which can be placed in registry for loading and unloading storable material in the inner shell.

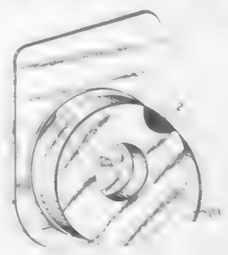
3,371,774

CORELESS ROLL DISPENSER

Martin J. Lilly, Neptune, N.J., assignor to Sun Chemical Corporation, New York, N.Y., a corporation of Delaware

Filed Oct. 19, 1966, Ser. No. 587,749

1 Claim. (Cl. 206—52)



This invention relates to a dispenser for a coreless cylindrical roll of material which has a coreless cylindrical region and preferably comprises decorative ribbon-like material. A planar backing member serves as a support or base for a cylindrical, preferably transparent, encasing blister affixed to the backing member and adapted to contain the coreless roll. The encasing blister comprises a cylindrical hub which extends part-way in the hole, and which hub is closed generally across said region to define a closed space between the hub means and the backing member. An elongated resilient strip is disposed within the coreless region to bear outwardly against the roll, which not only facilitates to serve in dispensing the ribbon therefrom but also maintains a tight roll for neat appearance. A circumferential tab is provided for opening the blister whereat the roll may be dispensed beginning with the outer-most layer.

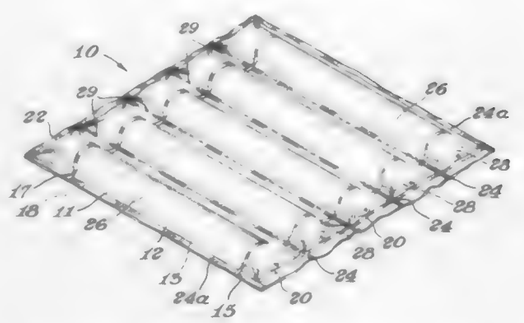
3,371,775

PACKAGE FOR ELONGATE OBJECTS AND METHOD OF PACKAGING ELONGATE OBJECTS

Russell L. Butler, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Filed Aug. 2, 1965, Ser. No. 476,486

13 Claims. (Cl. 206—56)



An improved cigar package is prepared from a three layer film having polyethylene on the outer surfaces and a central layer of Saran. Cigars are hermetically sealed in individual packets.

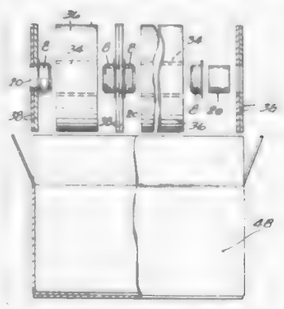
3,371,776

DOUBLE PLUG FOR ROLL-SUPPORTING CORES

Marvin C. Voissem, Appleton, Wis., assignor to Badger Plug Company, Appleton, Wis., a corporation of Wisconsin

Filed Apr. 27, 1967, Ser. No. 634,206

12 Claims. (Cl. 206—65)



A pair of plugs very slightly tapered for wedging insertion into the aligned cores of paper rolls and the like are connected by telescopic engagement back to back upon a sleeve (usually but not necessarily of boxboard stock) which may be detachably engaged frictionally with both plugs or may be cemented in place (but preferably to not more than one of the plugs). The flanges on the two plugs may be in face contact or may be spaced by engagement with opposite faces of an intervening panel apertured to pass the sleeve which connects the two plugs,

such panel constituting a separator in a carton in which rolls mounted on the respective plugs are packed for shipment with their axes either vertical or horizontal.

3,371,777
MULTIPLE ARTICLE DISPLAY PACKAGE
Martin J. Lilly, Neptune, N.J., assignor to Sun Chemical Corporation, New York, N.Y., a corporation of Delaware
Filed Oct. 20, 1966, Ser. No. 588,128
1 Claim. (Cl. 206—78)

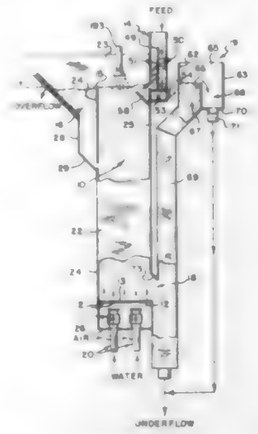
The present invention is a display package for displaying ornamental articles in original shape and comprises a backing member of cardboard or the like with an integral housing member for the articles supported therefrom. The housing has a peripheral flange for attachment to the backing member and then extends outwardly thereof to define a peripheral semi-wall for lending rigidity. A further wall extending in spaced apart relation to the backing member closes the housing with the semi-wall, the further wall comprising a plurality of individual spaced apart tapered oval compartments bulging away from the backing member and having arcuate reinforced ridges rising between the compartments longitudinally of the compartments and the backing member and transversely of the compartments and backing member. Access is had through the back of the backing member through the use of U-shaped lines of perforations connected together by a perforated line and having opposed tear-tabs for insertion of the fingers to open the back along the lines of perforations.

3,371,778
METHOD OF TREATING STARCHES FOR FLOTATION OF MINERALS
Iwao Iwasaki, Minneapolis, Minn., assignor to The Regents of the University of Minnesota, Minneapolis, Minn., a corporation of Minnesota
No Drawing. Filed Feb. 12, 1965, Ser. No. 432,395
11 Claims. (Cl. 209—3)

A method of concentrating finely divided oxidized iron ores in which the gangue material is principally siliceous by froth floation of the gangue away from the iron constituents based upon the discovery that good metallurgical results can be obtained with reduced amounts of starch depressant if the starch is gelationized and subjected to violent shearing action before addition to the ore pulp.

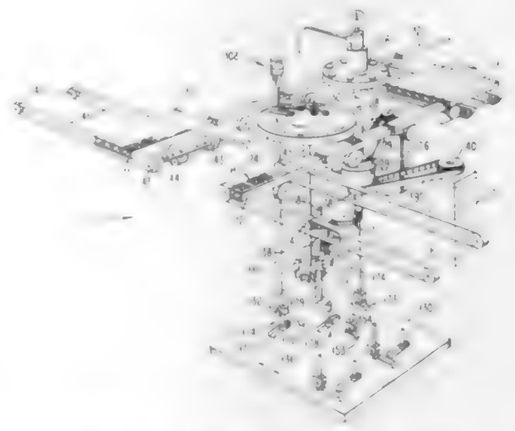
3,371,779
CONCENTRATION OF MINERALS
Clinton A. Hollingsworth, Lakeland, and Bobby L. Sapp, Plant City, Fla., assignors to The Borden Company, New York, N.Y., a corporation of New Jersey
Filed June 24, 1965, Ser. No. 466,546
23 Claims. (Cl. 209—166)

The invention relates to the concentration and beneficiation of minerals and other particulate matter by froth flotation, more particularly to a novel hydraulic-pneumatic flotation apparatus and to a novel method of froth flotation by the dispersion of aerated water in a hydraulic



compartment and its uniform distribution through a constriction plate into a flotation chamber.

3,371,780
APPARATUS FOR MECHANICALLY AND ELECTRICALLY TESTING THE QUALITY OF BONDED JOINTS
Kendall Clark, Poughkeepsie, N.Y., assignor to International Business Machines Corporation, Armonk, N.Y., a corporation of New York
Filed Apr. 25, 1966, Ser. No. 544,993
9 Claims. (Cl. 209—73)

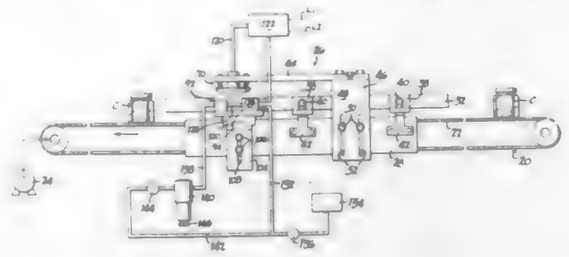


1. Apparatus for testing the joint bonding microminiature chip device to the surface of a substrate of a microminiature module comprising:
means for supporting said module;
means for subjecting the joint of a module in said support means to a blast of fluid medium; and
means for moving said blast means relative to the module to successively subject the joint to tensile, shear and compressional forces.

3,371,781
APPARATUS FOR INSPECTING SEALED CONTAINERS
George D. Armbruster and Walter J. Ringel, Toledo, Ohio, assignors to Owens-Illinois, Inc., a corporation of Ohio
Filed Apr. 12, 1965, Ser. No. 447,248
4 Claims. (Cl. 209—111.8)

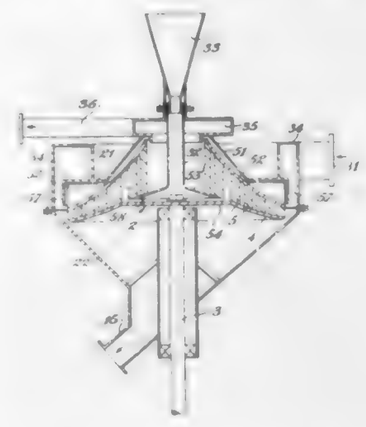
Apparatus for inspecting sealed containers at high production rates to determine whether or not an adequate vacuum exists within the container. A proximity sensor is

mounted to be accurately positioned with respect to a flip panel in the container cap, regardless of variations in con-



tainer height or cocking or tilting of the cap on the container.

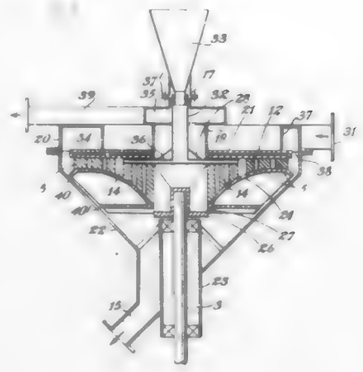
3,371,782
CENTRIFUGAL AIR CLASSIFIERS
Paul Meyer, 19 Paget Road, London, N. 16, England, and Geoffrey Daniel Humphreys, Woodbridge, Ash Road, Hartley, near Dartford, Kent, England
Filed Dec. 8, 1965, Ser. No. 512,308
Claims priority, application Great Britain, Dec. 11, 1964, 50,647/64; Sept. 8, 1965, 38,374/65
8 Claims. (Cl. 209—144)



1. A rotary air classifier including a casing provided with an inlet for material to be classified and a discharge outlet for classified particles, and a rotor mounted to revolve about a vertical axis within the casing, said rotor comprising a top plate and a bottom shroud plate, the classifying zone defined between said plates being subdivided by radial blades, said zone being open at its perimeter for admission of carrier fluid from the casing, means for introducing material to be classified into the rotor in a direction such that it is thrown by centrifugal force across the air stream in the classifying zone, the fluid and fines discharging through a central orifice in the rotor and the shroud plate being sloped downwardly and outwardly to permit gravity to assist in rejection of particles near "cut size" and not rejected by centrifugal force exceeding the drag exerted by the carrier fluid, means for supplying carrier fluid to the casing and means for imparting rotation to the rotor.

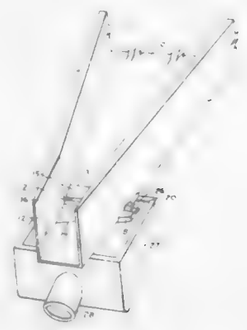
3,371,783
CENTRIFUGAL AIR CLASSIFIERS
Paul Meyer, 19 Paget Road, London, N. 16, England, and Geoffrey Daniel Humphreys, Woodbridge, Ash Road, Hartley, near Dartford, Kent, England
Filed Dec. 8, 1965, Ser. No. 512,309
Claims priority, application Great Britain, Dec. 11, 1964, 50,647/64
18 Claims. (Cl. 209—144)

1. A rotary air classifier including a casing provided with an inlet for material to be classified and a discharge outlet for classified particles, and a rotor mounted to revolve about a vertival axis within the casing, said rotor comprising a top plate and a bottom shroud plate, the classifying zone defined between said plates being subdivided by radial blades, said rotor having a central orifice for discharge of fluid and fines, said zone being open at its perimeter for admission of carrier fluid from the



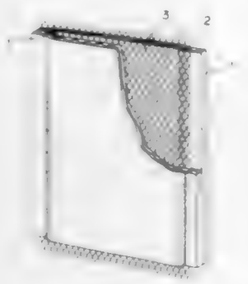
casing, said shroud plate being sloped downwardly and towards the centre to permit gravity to assist in rejection of particles of approximately "cut size" and not ejected by centrifugal force exceeding the drag exerted by the carrier fluid, said shroud plate having at least one central opening for ejection of the rejected particles, means for supplying carrier fluid to the casing and means for imparting rotation to the rotor.

3,371,784
APPARATUS FOR GRAVITY SEPARATION OF MATERIALS
Richard John Conway, Kingscliff, New South Wales, Australia, assignor to John A. Foyster, Olga M. Foyster, Clive J. Foyster, Lloyd Foyster and Mark Foyster, all of Kingscliff, New South Wales, Australia
Filed Oct. 21, 1966, Ser. No. 588,435
Claims priority, application Australia, Oct. 27, 1965, 65,834/65
5 Claims. (Cl. 209—458)



Gravity separation apparatus having a sluice unit with a base sloping downwardly from rear to front and wherein two outlet members are supported in an opening in the base to define a downwardly and rearwardly extending slot through which a lower stratum may pass, one of the outlet members being fixed, the other slidable along an inclined face of the base whereby the size of the slot can be varied.

3,371,785
METHOD OF DEHYDRATING SLUDGE
Yuiti Hanami, Tokyo, Japan, assignor to Kurita Industrial Co., Ltd., Osaka-shi, Japan, a corporation of Japan
Filed June 13, 1966, Ser. No. 556,946
Claims priority, application Japan, June 19, 1965, 40/36,447; Oct. 22, 1965, 40/64,853; Dec. 17, 1965, 40/77,927
4 Claims. (Cl. 210—65)



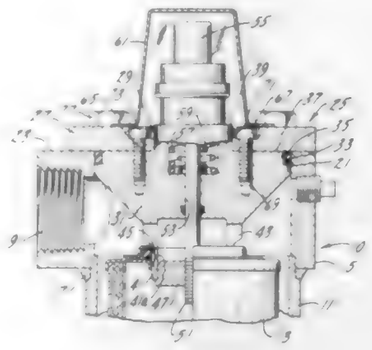
A method for rapidly dehydrating sludge by inserting into a layer of sludge containing fur or highly hygroscopic, colloidal solids formed during water-treatment procedures, a strip made of a liquid-pervious material having numerous fine passageways and spacer means, with one end of said strip protruding below the bottom of said sludge layer, or with both ends thereof protruding above and below the upper and lower surfaces of said sludge layer.

3,371,786
FILTER PRESS
James D. Fann, 3202 Argonne, Houston, Tex. 77006
Filed Feb. 1, 1965, Ser. No. 429,397
6 Claims. (Cl. 210—90)

The disclosure is of filtration apparatus having pressure differential generating systems wherein both the filtration driving pressure and the back pressure are controlled. The back pressure is always maintained lower than the filtration driving pressure, and the back pressure is controlled against becoming excessive, so that the filtrate receiver assembly is protected against being subjected to excessive pressures.

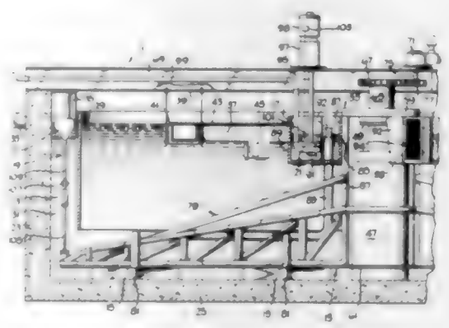
3,371,787
INDICATING BY-PASS ASSEMBLY
Walter J. Kudlaty, Elmhurst, Ill., assignor to Marvel Engineering Company, Chicago, Ill., a corporation of Delaware
Filed Oct. 1, 1965, Ser. No. 492,230
2 Claims. (Cl. 210—90)

A filter comprising a housing having an open end; a filter in the housing; a core in sealing engagement with said open end and a separate closure plate removably secured to the core and the open end. A by-pass valve is operatively



connected with the filter in the housing; an indicator means is associated with the core outside the housing and means operatively connecting the valve and the indicator means.

3,371,788
WASTE TREATING APPARATUS
Eugene J. Smith, Storms Road, Valley Cottage, N.Y. 10989
Filed June 29, 1965, Ser. No. 468,025
2 Claims. (Cl. 210—121)

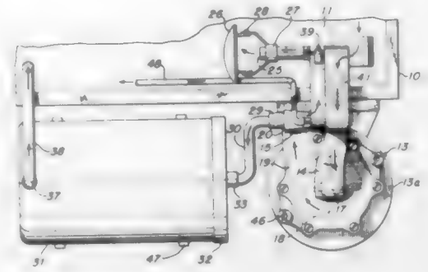


A waste treatment clarifier having a peripheral raceway inlet and a flat bottom. A sludge-sweeping arm is rotatively supported from a central pier with the arm carrying a plurality of V-shaped plows. A conduit extends from the apex of each plow to a basin located below the fluid level of the clarifier to conduct fluid and sludge from each plow to the basin. The flow through each conduit is adjustable. The fluid from the basin is pumped intermittently to a treatment means. A pivotal scum-skimmer is supported adjacent the end of the sludge-sweeping arm which skimmer rides in the raceway and moves scum to an outlet therein.

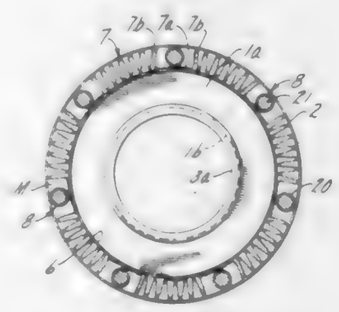
3,371,789
COMBINATION LIQUID FILTERING, HEATING AND AERATING DEVICE
Francis F. Hense, 1429 Wilmington Ave., Apt. 301, Dayton, Ohio 45420
Filed June 28, 1965, Ser. No. 467,671
9 Claims. (Cl. 210—169)

A combination filtering and aerating device for an aquatic life-supporting system featuring a pump, the intake conduit of which withdraws liquid from the reservoir and the discharge conduit simultaneously forces water

through a separate filter unit from which it returns to the reservoir and through an aerating device before discharging directly into the reservoir. Because of the pumping efficiency thus gained, all of the apparatus may be removed from the reservoir and heated, filtered and aerated water may be recirculated therein with the involvement of only three fluid passages in communication therewith.

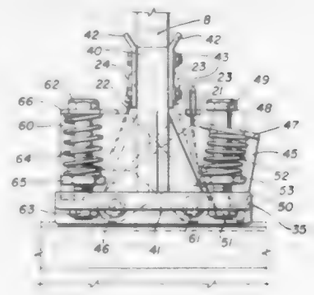


3,371,790
MAGNETIC FILTER
Walter J. Kudlaty, Elmhurst, Robert N. Luchetta, Bensenville, and Robert T. Sochor, Berwyn, Ill., assignors to Marvel Engineering Company, Chicago, Ill., a corporation of Illinois
Filed Jan. 13, 1965, Ser. No. 425,207
4 Claims. (Cl. 210—223)



4. A filter comprising a pair of end caps, a hollow, perforated core formed of magnetically-attractable material and extending axially between said caps, a filter element formed of nonmagnetically-attractable mesh material and arranged in pleated valleys and ridges about said core and between said caps, the filter element material in the bottom portions of said valleys being in contact with said core, and a plurality of thin, pencil-like magnet members circumferentially spaced about and upon said filter element and in magnetically-attracted relationship with said core, said magnet members being positioned each in and on a bottom portion of one of said valleys, the valleys in which one of said magnet members is positioned having a greater width than that of adjacent valleys, said magnet members having a length less than the longitudinal extension of said filter element whereby said magnet members may be moved toward one of said end caps to expose one end of said magnet members from the other of said end caps, each said magnet member comprising an elongated hollow tube, a plurality of individual cylindrical magnets within said tube, the opposite ends of said tube being closed to retain said individual magnets therein, said individual magnets having their polarities in magnetically opposing relationship whereby the area of magnetism produced thereby is expanded, the poles of said individual magnets within each of said tubes being circumferentially aligned with the poles of individual magnets within adjacent tubes and being opposite.

3,371,791
SCRAPER FOR ROTARY, MULTIPLE DISC FILTERS
Floyd D. Schryver, Arvada, Colo., assignor to Denver Equipment Company, Denver, Colo., a corporation of Colorado
Filed July 13, 1964, Ser. No. 382,194
10 Claims. (Cl. 210—327)

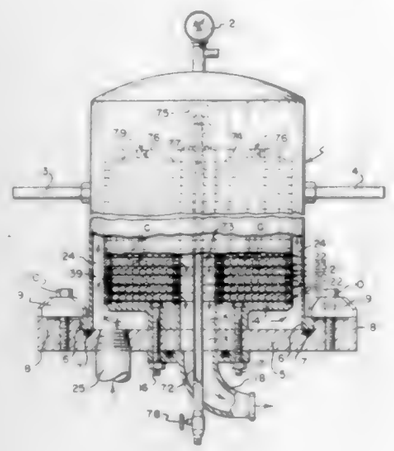


10. A scraper assembly for disc filters wherein a scraper blade is mounted on each side of a disc for removal of cake from said disc, comprising pivotal supports mounted on both sides of a filter disc, each said support being resiliently mounted at its inner end for limited movement, a blade secured to each said support, an outer blade support including a reciprocal support member having a base portion disposed on a support surface of the filter adjacent the outer peripheral edge of said disc and an upright portion disposed between the ends of the base portion, guide means mounted on said upright portion and on both sides of said disc so as to maintain said support centered on said disc, said blade support including a lever arm secured to the outer end of each said blade, said lever arm having a lateral surface portion and a portion extending downwardly and inwardly from its associated blade toward the disc and being pivotally secured to said base portion at its lower end below the removal point of the cake from the disc by the blade and a spring mounted between each said lateral portion of each of said lever arm and said base portion so as to independently bias said blade under spring pressure directed toward said disc, the lever arms being crossed at their lower ends and each lever arm being pivoted at a point below the removal point of the cake from the disc on the opposite side of the disc and spaced substantially therefrom.

3,371,792
MULTIPLE FILTER PLATE UNITS
John E. Weyand and John H. Bush, Needham, and Per L. F. Feyling, Belmont, Mass., assignors to Millipore Filter Corporation, Bedford, Mass., a corporation of Massachusetts
Filed Mar. 21, 1966, Ser. No. 535,945
8 Claims. (Cl. 210—335)

A filter plate unit including an inlet filter plate, an outlet filter plate, two intermediate filter plates arranged in stacked relationship with one of the intermediate plates

positioned between the inlet plate and the outlet plate and the other intermediate at one end of the stack, and



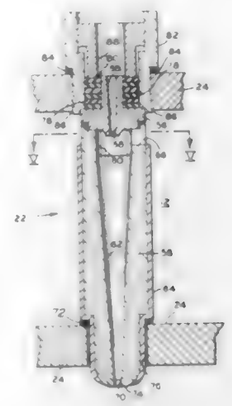
a pluraliy of filters, each of which is positioned between the adjacent filter plates.

3,371,793
CONFORMABLE OIL FILTERING DEVICE
F. Robert J. Fowler, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 12, 1966, Ser. No. 549,674
1 Claim. (Cl. 210—445)

A filter device comprising an envelope of porous filter material sandwiched between impervious sheet material, two ports or ducts being provided with one of those ports or ducts extending through the impervious material and the filter material to the interior of the envelope and the other of those ports or ducts extending through the impervious material. Preferably, the filter material is in one piece and in the form of a folded sheet so that one edge of the envelope formed is a fold and the remainder of the envelope perimeter is clamped or sealed by clamping pressure of the impervious sheet material enclosing the envelope. The concept is such that the device is conformable to a wall defining a restricted zone of use such as a transmission housing or an engine crankcase and despite irregularities and shallow areas which may characterize such zone.

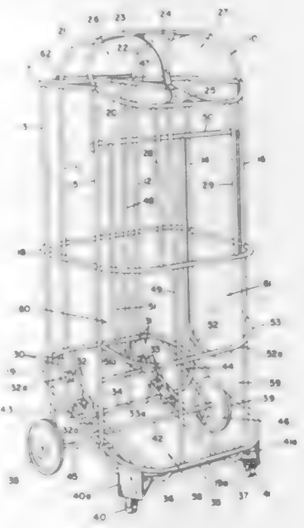
3,371,794
MANIFOLDED HYDROCYCLONE UNIT
Oscar W. Johnson, Greenwich, Conn., assignor to Dorr-Oliver Incorporated, Stamford, Conn., a corporation of Delaware
Continuation of applications Ser. No. 237,471, Nov. 14, 1962, and Ser. No. 483,021, Aug. 23, 1965. This application Nov. 28, 1966, Ser. No. 597,477
4 Claims. (Cl. 210—512)

A manifolded hydrocyclone unit having a plurality of ceramic cyclones reinforced against thermal and mechanical shocks and stresses by an encapsulating metallic shell



fused to the ceramic body of the cyclone and placing the ceramic body under compression.

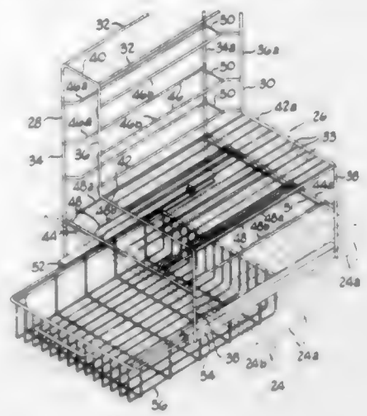
3,371,795
BALL RACK
Paul J. Rosonke, Sacred Heart Military Academy, Watertown, Wis. 53094
Filed Jan. 18, 1966, Ser. No. 523,626
4 Claims. (Cl. 211—14)



A portable, wheeled storage and dispensing rack for basketballs and the like, including an upright frame having four upright chutes and a pair of upper openings for inserting balls into the four chutes. Four lower openings are provided for withdrawing the balls from the chutes. Guide bars and rollers are provided for directing the ball toward the lower openings. The frame has top members extending over the chutes for retaining the balls in the chutes when the rack is tilted backwardly on its wheels when traversing stairs or when it is placed in a substantially horizontal position.

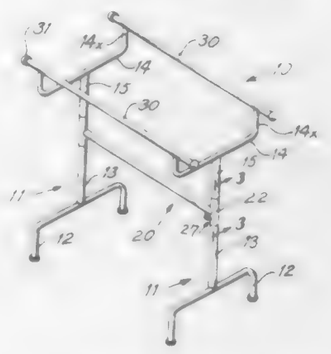
3,371,796
REFRIGERATOR STORAGE RACK
Richard O. Crouch and Russell S. Townsend, Fort Smith, Ark., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Dec. 27, 1965, Ser. No. 516,452
6 Claims. (Cl. 211—74)

A wire rack structure usable as an addition to, and supportable by, a refrigerator shelf for maximizing the use



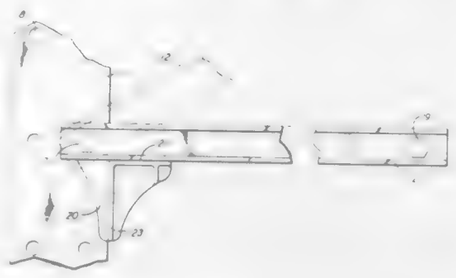
of the space between the usual refrigerator shelves.

3,371,797
FOLDING RACK
Joseph Caligiuri, Yonkers, N.Y., assignor to Hudson Fixtures Incorporated, a corporation of New York
Filed May 9, 1966, Ser. No. 548,490
1 Claim. (Cl. 211—178)



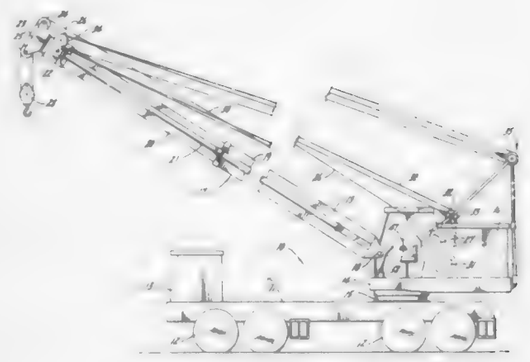
This invention relates to folding racks for dresses and apparel merchandise and more particularly to a rack that can be folded into a planar or flat configuration. The rack is made of tubular elements, having a pair of spaced apart legs and intermediate securing means.

3,371,798
CANTILEVER STORAGE RACK
Thomas N. D'Altrui, Union, N.J., assignor to Midland Machine Company, Elizabeth, N.J., a corporation of New Jersey
Filed July 11, 1966, Ser. No. 564,073
3 Claims. (Cl. 211—182)



1. A storage rack comprising:
a plurality of vertical posts each having first and second abutting walls at right angles;
a plurality of vertically arranged first apertures in the post second wall;
a bracket mounted on each post comprising a base plate part of which is mounted flush against the post second wall and part of which extends from the post second wall beyond the first wall;
the bracket further including a first support wall extending transversely from one side of the base and being flush with the post first wall, and a first load-bearing wall extending transversely from the base plate at substantially a right angle with respect to the first support wall;
a cantilever beam resting on the first load-bearing wall and having a second aperture near one end;
the bracket base plate having a third aperture;
and a bolt extending through one of the first apertures, the second aperture and the third aperture, whereby the cantilever beam is supported in a horizontal position by the bolt and the first load-bearing wall, and the bracket is supported by the bolt and the post first wall which bears against the first support wall of the bracket;
the bolt being located farther from the post first wall than any part of the first load-bearing wall, whereby the cantilever beam is free to pivot about the bolt if an upward force is exerted thereon.

3,371,799
TELESCOPIC BOOM ANGLE CONTROL SYSTEM
Roy D. Brownell, Aurora, and Granville Woolman, Naperville, Ill., assignors to Baldwin-Lima-Hamilton Corporation, Chicago, Ill., a corporation of Delaware
Filed Mar. 1, 1967, Ser. No. 619,628
12 Claims. (Cl. 212—35)

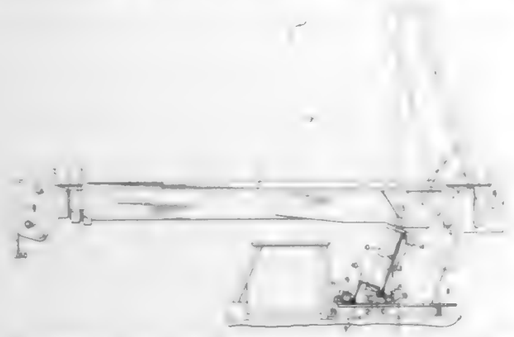


A boom angle control system for a cable supported telescopic boom section employing boom angle sensing mechanism operative to control the effective length of supporting cable to maintain a preselected boom angle as the telescopic boom section is extended or retracted by independent power means.

3,371,800
SAFE LOAD CONTROL DEVICE FOR CRANES
John L. Grove, Greencastle, Pa., assignor to Grove Manufacturing Co., Shady Grove, Pa., a corporation of Pennsylvania
Filed July 21, 1966, Ser. No. 566,856
10 Claims. (Cl. 212—39)

An overload preventive control device for cranes of the stationary and/or mobile types, the booms of which are pivotally raised and lowered in vertical planes, by

means of extensible hydraulic motor or ram means, including a pressure actuated switch responsive to the arcuate movements of the extensible lift ram, and the fluid

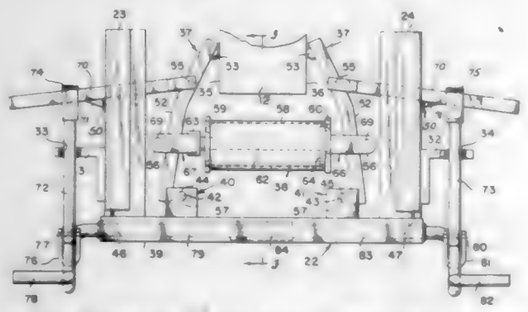


pressure within said ram to calculate the crane tipping moment and render inoperative selected operations of the crane.

3,371,801
EXTENSIBLE JIB, MAST OR THE LIKE
Lars Harald Widegren, Larargatan 14, Kiruna, Sweden
Filed Aug. 8, 1966, Ser. No. 570,881
Claims priority, application Sweden, Oct. 6, 1965, 12,943/65
6 Claims. (Cl. 212—55)

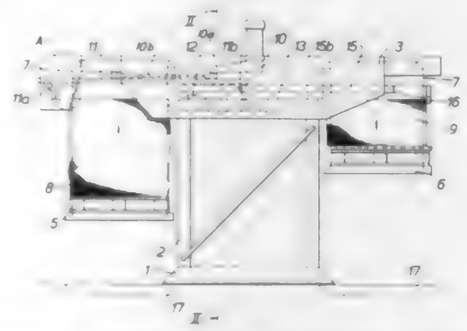
Extensible and retractable boom means comprising a trough-shaped steel strip.

3,371,802
COIL SPRING TYPE COUPLER CENTERING DEVICE
Stephen C. Dungan, Munster, Ind., assignor to Stanray Corporation, Chicago, Ill., a corporation of Delaware
Filed Mar. 11, 1966, Ser. No. 540,447
14 Claims. (Cl. 213—20)



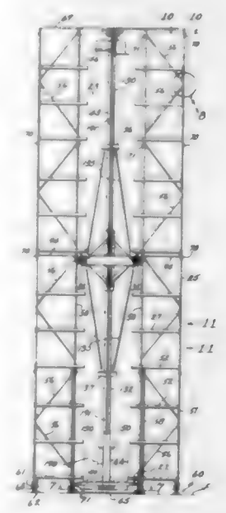
The introduction of the "Hi-Cube" auto service box car, as well as the long flat car for piggyback service, and other new types of railroad rolling stock, has created quite a maintenance problem because of damage caused by passing couplers. Because of the wide swing required of couplers on the new cars and their unusually heavy weight, it is difficult for the average trainman to manually center the couplers according to approved practice for recoupling. This invention provides a coil spring mounted in the coupling mechanism under the coupler to automatically move the coupler to coupling range from any off center position when uncoupled.

3,371,803
PROCESS AND APPARATUS FOR RESTACKING, LOOSENING AND ALIGNING MATERIAL IN SHEET FORM
Karl Hosch, Ostbahnhofstr. 46, Kempten, Allgau, Germany, and Walter Gassner, Jacob Muffelstr. 25, Nurnberg, Germany
Filed July 2, 1965, Ser. No. 469,172
5 Claims. (Cl. 214—6)



Apparatus for loosening stacked sheets operates to separate small piles in succession from a supply stack, transfer the separated piles to a conveyor which supports the piles centrally, with their overhanging lateral edge regions hanging down so that sheet edges fan out and separate, assisted by compressed air jets. The small piles are aligned crosswise by lateral guides and lengthwise by a stop frame and are re-united to form a delivery stack.

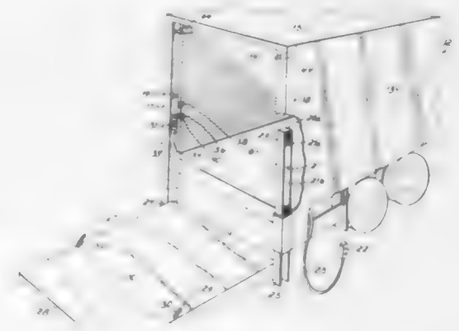
3,371,804
AUTOMATIC WAREHOUSING SYSTEM
Anthony R. Chasar, Columbiana, Ohio, assignor to The Triax Company, Cleveland, Ohio, a corporation of Ohio
Continuation-in-part of application Ser. No. 373,803, June 9, 1964. This application Sept. 3, 1965, Ser. No. 484,845
13 Claims. (Cl. 214—16.4)



8. In an automatic warehousing system, a storage frame and a mechanized carrier therefor; said storage frame comprising parallel storage frame sections having rows

of vertical aisle posts defining an aisle therebetween and having load supports arranged vertically between said aisle posts on either side of said aisle; horizontal tracks carried by asid aisle posts on either side of said aisle intermediate the top and bottom of said storage frame and below the mid-point between the top and bottom thereof; means connecting all of said aisle posts in each row only at the top and bottom of said storage frame; said means and said tracks forming the sole connecting means for said aisle posts; said posts defining uninterrupted vertical storage bays between said tracks and said means; and said carrier engaging said tracks for travel of said carrier therealong.

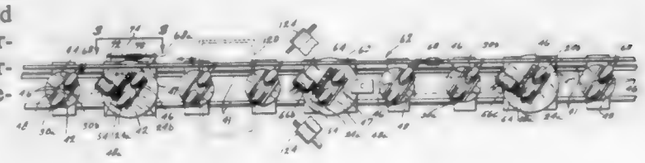
3,371,805
COMBINED ELEVATING AND CLOSING MECHANISM FOR CARGO PLATFORMS
William H. Himes, Dayton, Ohio, assignor to Leyman Manufacturing Corporation, Cincinnati, Ohio, a corporation of Ohio
Continuation-in-part of application Ser. No. 565,610, July 15, 1966. This application Aug. 2, 1967, Ser. No. 660,562
21 Claims. (Cl. 214—75)



A cargo door assembly for use with trailer trucks and the like including, for example, a first and a second mast assembly associated with opposite side walls of the truck's rear opening, each of the assemblies having a mast guide and a mast movable relative thereto, a platform pivotally secured adjacent the lower ends of the mast to permit swinging movement of the platform between an open and and a closed position, a chain having two ends with one of the ends being connected to the door, a compounding wheel rotatably mounted to the first mast guide, and a first anchor mounted to the first mast, the other end of the chain being connected to the first anchor, whereby the compounding wheel is selectively positionable between a first operating position whereat the chain can be engaged by the compounding wheel between the chain's ends when the masts are moved relative to the mast guide for swinging the platform between an open and a closed position like a door, and a second operating position whereat the chain can be engaged by the compounding wheel when the masts are moved relative to the mast guide for raising and lowering the platform like an elevator.

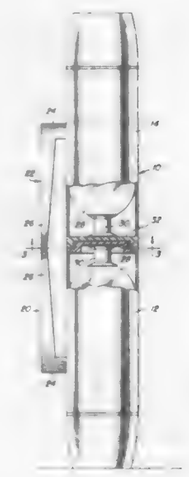
3,371,806
PIPE FEEDING SYSTEM
Everett R. Anderson, Pico Rivera, Calif., assignor to Pacific Pipeline Construction Company, a corporation of California
Filed July 20, 1966, Ser. No. 566,660
9 Claims. (Cl. 214—339)

A conveyor is disclosed for transporting pipes through a treatment station with combined axial and rotary motion to facilitate operations as coating and wrapping. The conveyor incorporates three groups of wheel-pairs, in which each pair of wheels is angularly displaced or canted in relation to the path of travel to accomplish the desired rotary-linear motion. Each of the three groups also includes a motive means to revolve the associated individual wheels, coupled together by the pipe in process. A con-



trol system is then incorporated to control each motive system whereby to synchronize the motion of pipes through the treatment station.

3,371,807
TWO-UNIT INSULATED BOTTLE ASSEMBLY
Ann J. Clouser and Nancy J. Hessert, both of R.R. 1907 Sweeley Ave., Williamsport, Pa. 17701
Filed June 3, 1966, Ser. No. 555,143
5 Claims. (Cl. 215—6)



This unit invention is a two-unit insulated vacuum bottle assembly, each unit being complete in itself, with each unit having complementary means for securing the two units together, and in addition, a handle on each unit for using the unit separately, in the form of a pitcher, the handles being so arranged that they complement each other when the units are secured together and act as a single handle for the assembled units. The handles are L-shaped, the long leg of each L extending substantially parallel to the longitudinal axis of the bottle assembly and terminating adjacent the bottom assembly securing ends and thus providing a substantially unitary handle for the assembled units.

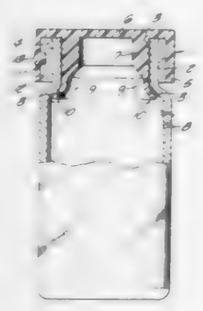
UNITARY SAFETY CAP
Evert D. Velt, 6182 Roy St., Los Angeles, Calif. 90042
Filed Aug. 1, 1966, Ser. No. 569,234
8 Claims. (Cl. 215—9)

8. In combination, a unitary safety bottle cap and a bottle having a neck provided with an opening; said cap comprising a cylindrical side wall and an end wall; said end wall internally of said side wall having a cylindrical stopper; said stopper having an end disposed in said bottle

and provided with resiliently inwardly deformable normally outwardly projecting portions; said bottle having internally thereof a shoulder; said resiliently deformable portions of said stopper being in engagement with said shoulder; said end wall having an undersurface and said bottle neck having an end surface disposed in cooperative sealing engagement; means rendering at least a portion of said side wall radially inwardly and resiliently deformable; and cooperative means internally of said side wall and externally of said neck including a thread and means coengageable with said thread for imposing on said stopper a force tending to withdraw the same from said neck responsive to inward deformation of said portion of said



side wall and relative rotation of said cap and said bottle, whereby to deform inwardly said portions of said stopper so that the same will pass said shoulder and enter said neck opening.

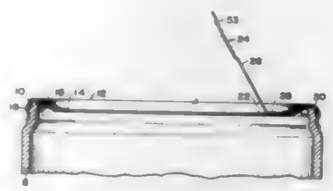
3,371,809
CLOSURE WITH SAFETY LOCK
Joseph B. Pompa, 79 Furlong Road, Rochester, N.Y. 14623
Filed June 30, 1967, Ser. No. 650,359
11 Claims. (Cl. 215—9)

A closure cap for a container of the type including an externally threaded neck, the cap member including an internally threaded generally cylindrical body portion closed at one end and removably threadedly engaged on the neck and including a radially shiftable abutment locking screw which is projectable into the thread path and is positionably behind the point at which at least one inner convolution of the threads on the neck terminates so as to provide an abutment for preventing the threaded closure cap from being unscrewed from the associated container neck as opposed to relying upon frictional engagement of a setscrew with a threaded portion of the neck of the container, the outer end of the abutment screw including a configuration which will render it difficult for a child to unscrew the abutment screw.

3,371,810
TEST TUBE CLOSURE
Friedrich Lüdi, Flawil, Switzerland, assignor to Ludi & Cie, AG., Flawil, Switzerland
Filed Apr. 26, 1967, Ser. No. 633,776
Claims priority, application Austria, Apr. 28, 1966, A 4,005/66
7 Claims. (Cl. 215—38)

A test tube closure for releasably maintaining a closure at the open end of a test tube. The closure includes a hollow cap having a transverse end wall for engaging the test tube at its open end, and the cap has a tubular wall extending axially from the periphery of the end wall and surrounding, with clearance, the exterior of the test tube at the region of the open end thereof. An elongated spring strip is situated within the tubular wall of the cap between the latter and the test tube, and this spring strip has a pair of opposed side edges which are axially spaced in the tubular wall of the cap so that one of these side edges is nearer to the end wall of the cap than the other of the side edges. This spring strip is formed with a series of axially extending slots situated between its opposed side edges and terminating short of these opposed side edges so as to provide the spring strip between the slots with elongated springy wall portions spaced from each other by the slots of the spring strip. These springy wall portions of the spring strip are curved inwardly away from the outer tubular wall of the hollow cap and the springy wall portions have crests provided with inner surfaces directed inwardly away from the tubular wall of the cap and adapted to resiliently engage the exterior surface of the test tube for resiliently holding the cap thereon.

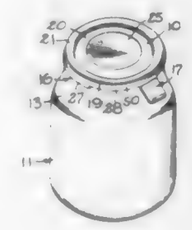
3,371,811
CONTAINER CLOSURE
William H. McKnight, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Nov. 20, 1964, Ser. No. 412,607
3 Claims. (Cl. 215—39)



1. An improved closure for open mouth containers which are vacuum packed and hermetically sealed and which may be readily reclosed and reopened once the vacuum is broken which comprises, a circular top panel projectable within a mouth-defining neck portion of a container, an annular gasket-receiving channel inclined outwardly and upwardly from the outer margin of the said top panel for receiving said mouth-defining neck portion of such container, means for gripping an outer finish of said neck portion, an annular sealing gasket positioned within said annular gasket-receiving channel, a vent penetrating the top panel of said closure, a partially removable tab permanently secured to the upper surface of said closure adjacent the perimeter thereof and extending inwardly to cover said vent and prevent loss of vacuum until such time as said tab is partially removed, and said tab being permanently fixed at its outer extremity adjacent the perimeter with a high peel strength adhesive and semi-permanently affixed inwardly thereof by a low peel strength adhesive.

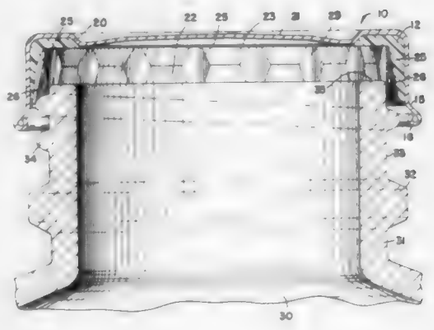
2. An improved closure as defined in claim 1 wherein the said means for gripping the outer finish is an annular downwardly-depending curvilinear beam section bounding said gasket-receiving channel which conforms to and grips said gasket-receiving channel which conforms to and grips said finish.

3,371,812
BEADED CONTAINER WITH LIFT TAB COVER
John A. Foster, Rockford, Ill., assignor to J. L. Clark Manufacturing Co., Rockford, Ill., a corporation of Illinois
Filed Dec. 14, 1966, Ser. No. 601,784
5 Claims. (Cl. 215—39)



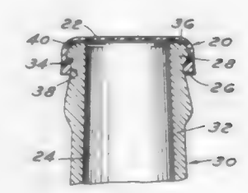
5. A container having, in combination, a cylindrical tubular body having a downwardly rounded lip bead extending around its open end, a cover of relatively thin and resilient sheet metal having a generally flat top and having an integral skirt depending from the periphery of the top and telescoped down over said bead; said skirt including a first arcuate section extending circumferentially around a relatively long arc of said bead, a second arcuate section disposed at the periphery of said top opposite said first section and extending around a shorter arc of said bead, and two intermediate arcuate section of lesser arcuate length than said first section but of greater arcuate length than said second section each extending angularly between adjacent ends of said first and second sections; said first skirt section having a lower free edge portion hooked fully around said bead to hold said cover firmly on said body, said intermediate skirt sections each being hooked only partially around said bead and having free edge portions offset upwardly from and spaced above the plane of the free edge portion of said first skirt section, and said section skirt section having a lower portion hooked around said bead below the free edge portions of said intermediate sections; a pull tab integral at its upper end with and constituting an extension of said second skirt section, said tab extending downwardly and outwardly from said bead to present a free end portion adapted for manual grasping; and a pair of upright score lines angularly spaced in opposite directions from said tab and each formed between the ends of one of said intermediate sections with the angular distance between each score line and the adjacent side of the tab being at least as great as the arcuate length of said second skirt section.

3,371,813
PRESS-ON TURN-OFF CLOSURE CAP
Ronald C. Owen, Harwood Heights, and Donald H. Zipper, Western Springs, Ill., assignors to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed May 13, 1966, Ser. No. 549,997
14 Claims. (Cl. 215—40)



A press-on turn-off cap including a shell lined with a gasket compound, the gasket being shaped to include a plurality of radially projecting ribs having the outer surface tapering inwardly toward the top panel of the shell. This provides for more even application of the cap to a container and greater package security through better thread forming to hold the cap in place and permit easier removal. Hot or cold application to the container is also permitted by the novel cap design. Such ribs occupy from 30% to 70% of the total circumferential side surface area.

3,371,814
SINGLE PIECE PLASTIC BOTTLE CAP
Wallace C. Ruprecht, Mount Clemens, Mich., assignor to Ex-Cel Industries, Inc., Warren, Mich., a corporation of Michigan
Filed Nov. 29, 1966, Ser. No. 597,672
9 Claims. (Cl. 215—40)

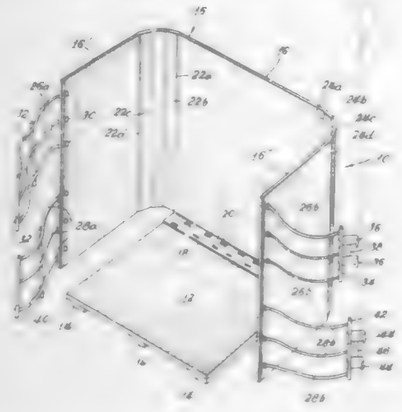


8. In combination, a bottle having a neck portion including a central opening and an adjacent external annular rib, and a single piece plastic closure having a skirt portion overlying said annular rib and a top portion overlying said bottle opening, said skirt portion having an internal annular groove closely overlying and substantially conforming to said annular bottle rib and a thin annular lip joined to said skirt portion within said annular groove, said annular lip stretched over the upper portion of said annular bottle rib and conforming to said annular rib and said annular groove without formation of an air gap between said closure top portion and the bottle top opening.

3,371,815
FREIGHT BINDING DEVICE

Franklin S. Macomber, Park Ridge, Ill., assignor to A. T. Kearney Personnel Services, Chicago, Ill., a copartnership

Continuation-in-part of application Ser. No. 384,491, July 22, 1964. This application June 8, 1965, Ser. No. 465,830
23 Claims. (Cl. 220—1.5)

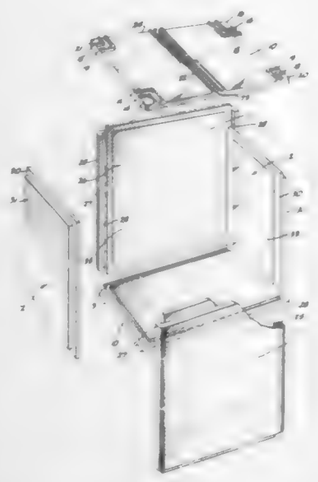


A freight binding member comprising a generally upright wrapper which is connected at its lower end to at least one edge of a generally rectangular rigid base or pallet and which is of a length equal to at least approximately one-half the perimeter of the base so that the wrapper is capable of being held in tension around freight disposed on the base by tension straps or the like connected to the wrapper and yet the wrapper will permit the freight to extend beyond the edges of the base on sides thereof not connected to the wrapper.

3,371,816
COLLAPSIBLE RECEPTACLE

Fausto M. Ricci, 1090 Carolyn Way, Beverly Hills, Calif. 90210

Filed Oct. 22, 1965, Ser. No. 501,428
3 Claims. (Cl. 220—4)



A collapsible receptacle having a base, a pair of side walls removably affixed to the base, a pair of end walls removably affixed to the base and to the side walls and a cover covering said side walls and end walls and removably positioned thereon and means provided on the outside of said base and said cover permitting the interlocking for vertical storage with similarly constructed receptacles.

3,371,817
PLASTIC CONTAINER

Anthony J. Gasbarra, Flossmoor, and Alva J. Godshalk, Homewood, Ill., assignors, by mesne assignments, to Bennett Industries, Inc., Peotone, Ill., a corporation of Delaware

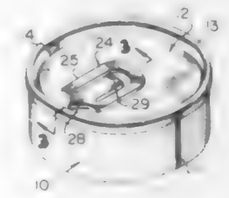
Filed Feb. 3, 1966, Ser. No. 524,780
13 Claims. (Cl. 220—40)

This invention is a plastic shipping container with a lug locking top to engage with lugs on the container for sealing engagement.

3,371,818
PLASTIC TAB AND INNER TAPE FOR EASY OPENING CAN END

John S. Bozek, Chicago, Ill., assignor to Continental Can Company, New York, N.Y., a corporation of New York

Filed May 27, 1966, Ser. No. 553,535
10 Claims. (Cl. 220—54)

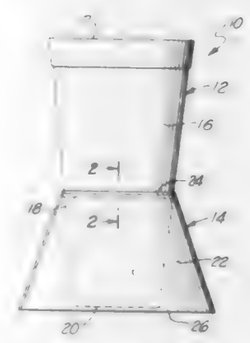


1. An easy opening panel construction for a container comprising a dispensing opening in said panel, a rupturable sealing member secured to said panel surrounding said dispensing opening and sealing said panel, and means for facilitating the rupturing of said sealing member including a cutter formed from the material of said panel and a pull tab connected to said cutter for moving said cutter through said sealing member.

3,371,819
POT CONSTRUCTIONS

David G. Zeman, Redondo Beach, Calif., assignor to Floroware Corporation, Redondo Beach, Calif., a corporation of California

Filed Oct. 23, 1965, Ser. No. 503,253
2 Claims. (Cl. 220—69)

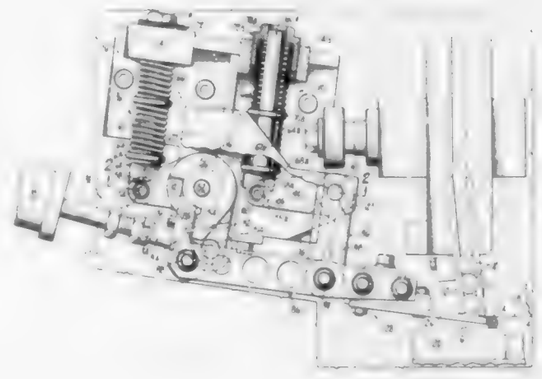


A pot structure is disclosed having a central pot member of a frustrial conical shape and a base having a frustrial conical shape. The pot member is located so that the upper end of the base engages the exterior of the pot member between its ends. Means are formed on the exterior of the pot member for holding the base with respect to the pot member.

3,371,820
STARTER MECHANISM FOR THREAD ROLLING MACHINE

Edward G. Grohoski, Litchfield, and Robert D. Morton, West Hartford, Conn., assignors to The Hartford Special Machinery Company, Simsbury, Conn., a corporation of Connecticut

Filed Dec. 7, 1966, Ser. No. 599,786
12 Claims. (Cl. 221—21)



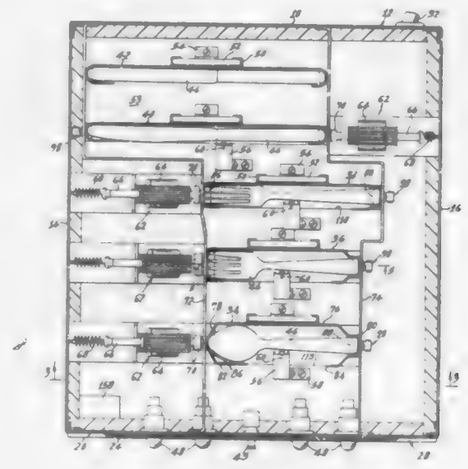
1. In a thread rolling machine of the type having a starter mechanism including a movable starter blade for high speed feeding of a series of work blanks from a feed chute to a work station, a linkage supporting the starter blade for movement toward and away from the work station, and drive means including a drive return device for pacing the operation of the starter blade linkage, the improvement comprising a pivotable crank responsive to operation of the drive means and its drive return device, and biasing means continuously urging the starter blade linkage into direct engagement with said pivotable crank for effecting a resilient lost motion connection between the drive means and the linkage upon occurrence of an abnormal feeding condition.

3,371,821
DISPENSING APPARATUS

Frederick J. Abood, Jr., 6455 San Juan Blvd., Apt. 24 32210, and Wolfgang Wieland, 2549 Forest Blvd. 32216, both of Jacksonville, Fla.

Filed May 25, 1966, Ser. No. 552,959
13 Claims. (Cl. 221—93)

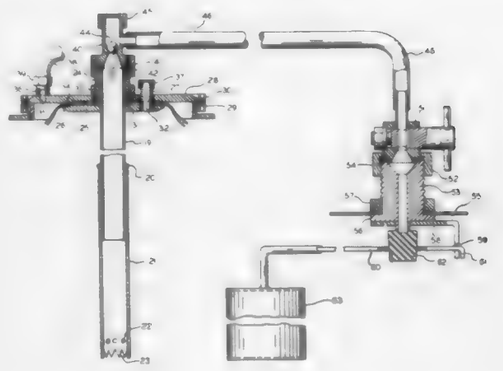
A dispensing apparatus having a plurality of flatware magazines holding vertical stacks of individual pieces of flatware therein, each magazine being provided with a pair of spaced shoulder means adjacent the lower end of the vertically extending magazine for engaging the lowermost piece of flatware and retaining the entire stack of flatware within the magazine. Selective means are positioned adjacent one end of the magazine and is engagable with and operable to move the lowermost piece of flatware out of engagement with one of the shoulder means and toward the other shoulder means to release the lowermost piece of flatware from the magazine and to permit the next adjacent piece of flatware to descend into supported engagement upon the pair of spaced shoulder means. Each magazine is removably supported on the apparatus with the pair of spaced shoulder means being attached to the magazine and the selective means being supported on the apparatus. The selective means includes an electrically operated dispensing member and electric means to selectively actuate such member to contact the lowermost piece of the flatware in the stack within the magazine to dispense same. A slot is provided in one end wall of the magazine through which the dispensing member extends and retracts and opposite to the slot adjacent the other end wall of the magazine is another slot with a releasing device associated therewith which is tensioned by the movement of the lowermost piece of flatware by the dispensing member through the slot in the one end wall with the releasing device urging the lowermost piece of flatware toward the one end wall of the magazine after such flatware has been moved by the dispensing member from engagement with the adjacent shoulder means on the one end wall. The dispensing member is spring biased to its inoperative position and an electrical solenoid is associated with each dispensing member which is selectively actuated by a switch to dispense the selected piece of flatware in the respective magazine. The selective means also includes a master switch and electrical means for energizing all of the solenoids simultaneously to dispense the lowermost piece of flatware from a plurality of magazines when an entire place setting is desired.



3,371,822
BULK DELIVERY, STORAGE AND DISPENSING APPARATUS FOR LIQUID ICE CREAM MIXES AND THE LIKE

Edwin J. Galloway, Menasha, Wis., assignor to Galloway Company, Neenah, Wis., a corporation of Wisconsin

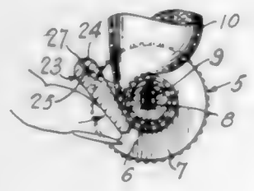
Filed July 1, 1966, Ser. No. 562,329
8 Claims. (Cl. 222—95)



1. Apparatus of the class described comprising: a rigid tank with an opening near its top; a dip tube passing through the opening and having a lower end in the tank,

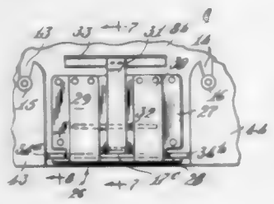
an upper end portion extending above the tank, and an outwardly extending plate near the top of the tank; a cover that closes off the tank opening, said cover lying atop said plate and having an opening through which said upper dip tube portion passes; holding means on said upper dip tube portion and engageable with the cover to support the dip tube on the cover and hold the plate against the cover; a liner in the form of a bag disposed in the tank, said liner being provided with a fill opening surrounding the dip tube above the plate; resilient seal means extending about the fill opening and clamped between the cover and plate to support the bag and seal off the fill opening; an air fitting leading downwardly through the cover at a point within the area of the tank opening but spaced outwardly from the area circumscribed by the seal means; closable vent means opening through the plate and cover within the area circumscribed by the seal means; and a releasable coupling connecting the cover to the tank.

3,371,823
TUBE SQUEEZER
Vagn A. Petersen, 168 Hillside Ave., Montreal, Quebec, Canada
Filed Nov. 29, 1966, Ser. No. 597,762
4 Claims. (Cl. 222—97)



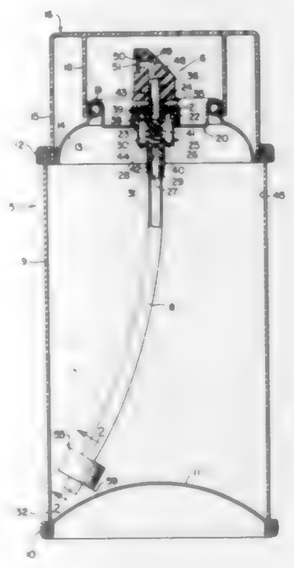
The device encompasses a tube squeezer having a central body with two removable end caps with a press lever pivotally mounted on the caps to permit pressing the tube as it is wound about the central body.

3,371,824
BEVERAGE DISPENSER CABINET
Donald D. Goss, Marblehead, Mass., assignor to H. P. Hood & Sons, Inc., Boston, Mass., a corporation of Massachusetts
Filed Aug. 1, 1966, Ser. No. 569,359
11 Claims. (Cl. 222—105)



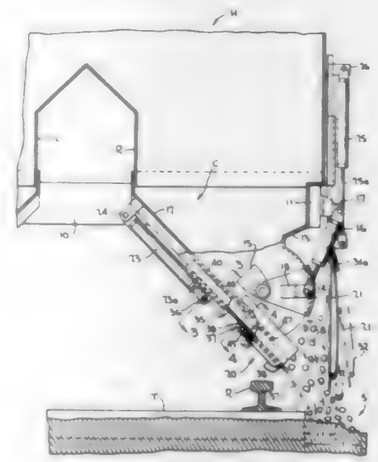
A beverage dispenser cabinet for storing and dispensing beverages of the type which are bulk packaged in flexible plastic bags includes a body member with a removable front wall having an opening receptive of the bag spout, interfitting means removably lock the front wall and body member in assembled relation against the liquid pressure of the beverage. The front wall may form separate upper and lower portions, with the upper portion being separately removable to provide front access to the cabinet when the beverage bag is partially emptied. For beverage bags having flexible spout means, the front wall opening is a gap beneath said front wall, and the cabinet has yielding pinch means for opening and closing the spout.

3,371,825
SORPTIVE GETTER FOR PRESSURE DISCHARGE DISPENSERS
John S. Cullen, Buffalo, N.Y., assignor to Multiform Desiccant Products, Inc., Buffalo, N.Y., a corporation of New York
Filed May 12, 1966, Ser. No. 549,697
1 Claim. (Cl. 222—190)



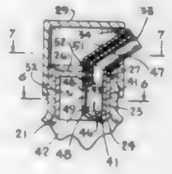
Trace water, and acids resulting therefrom, have plagued products in pressurized cans having a discharge dip tube leading from the bottom of the can to a manual discharge valve on the top head. To meet this problem a sorptive getter is attached to the bottom inlet end of the dip tube where not only it is immersed in the liquid and fully active to the end of use, but it is also immediately active against trace moisture diffusing back down through the dip tube as a consequence of operation and use.

3,371,826
BALLAST DELIVERING MECHANISM
Martin J. Speno, Syracuse, N.Y., assignor to Frank Speno Railroad Ballast Cleaning Co., Inc., Ithaca, N.Y., a corporation of New York
Filed Jan. 10, 1967, Ser. No. 608,430
12 Claims. (Cl. 222—504)



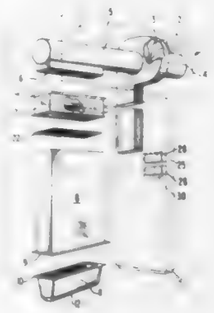
The invention is to a railway ballast discharge mechanism. A railway stone box car has an inclined side discharge chute with a hydraulically operated swinging gate, a power operated sliding chute continuing said discharge chute, and a power controlled baffle plate at the end of the sliding chute.

3,371,827
CAPTIVE CLOSURE FOR CONTAINERS WITH TURNABLE RETRACTABLE SPOUT
Lewis A. Micallef, New York, N.Y., assignor to Leeds & Micallef, New York, N.Y., a partnership of New York
Filed June 16, 1966, Ser. No. 558,047
25 Claims. (Cl. 222—507)



A dispensing cap, for a container, includes a rotatable valved spout and a cap and, when the cap is turned in opposite directions, the spout is cam moved to project through and, respectively, to be retracted from, an opening in the cap.

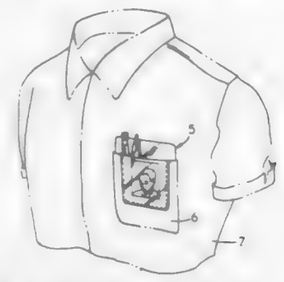
3,371,828
TURNING APPARATUS
Norman E. Elsas, Atlanta, Ga., assignor to Nemo Industries, Inc., Atlanta, Ga., a corporation of Georgia
Continuation-in-part of application Ser. No. 487,717, Sept. 16, 1965. This application Apr. 15, 1966, Ser. No. 549,110
15 Claims. (Cl. 223—43)



1. A textile article turning apparatus comprising an elongated hollow turning duct having an open end, vacuum means connected to said duct for causing a flow of air therethrough from said open end, valve means mounted within said duct between said vacuum means and said open end for controlling the flow of air therethrough, an expansible nozzle mounted on said open end and forming an axial extension of said duct, said nozzle being movable transversely of said duct between a partially collapsed position to permit the open end of a textile article to be positioned thereover and an expanded position to releasably retain a textile article positioned on said nozzle, and means for actuating said valve means alternately between an open and a closed position to cause an intermittent flow of air through said duct to turn an article positioned on said nozzle.

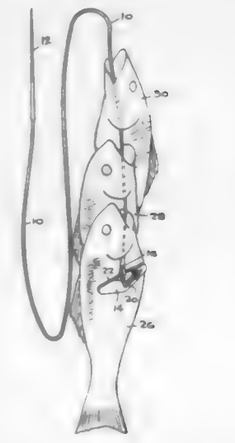
3,371,829
INSERT FOR A POCKET
Wilfred J. Phillips, 4745 Sherwood Drive, Pittsburgh, Pa. 15236
Filed Aug. 9, 1966, Ser. No. 571,346
6 Claims. (Cl. 224—5)

This invention constitutes an insert within a pocket, the insert including two portions, one of which extends within the pocket, and the other of which depends from



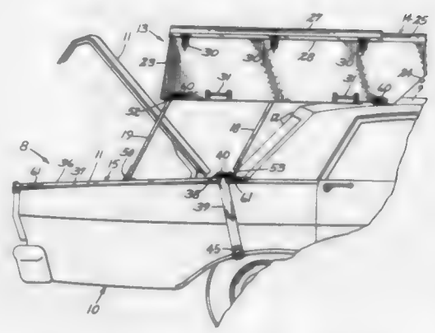
the pocket at the outer surface of the pocket, for displaying and protecting a card through a window therein.

3,371,830
FISH STRINGING DEVICE
William C. Parkman, 123 W. Hunter St. Lakeland, Fla. 33803
Filed May 24, 1967, Ser. No. 641,003
10 Claims. (Cl. 224—7)



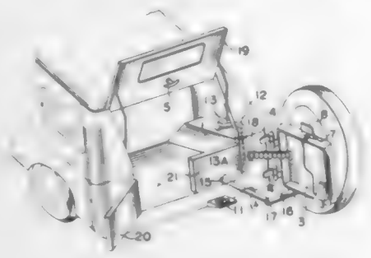
A fish stringer having a fish retainer plate attached to the end of a stringer cord slidable in a slot in the plate to an end portion of the plate to enable removal of the plate through the gills of a fish on the cord.

3,371,831
LUGGAGE CARRIER
Stanley C. Schaeffer, Box 144, Avoca, Minn. 56114
Filed Nov. 25, 1966, Ser. No. 597,051
6 Claims. (Cl. 224—42.1)



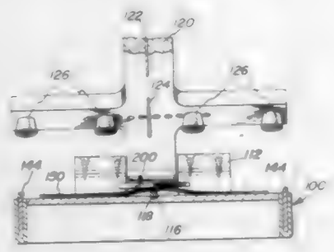
The specification discloses a box-like luggage carrier adapted to be attached in overlying relationship on the rear deck of an automobile or the like and capable of being swung upwardly on a plurality of arms to allow access to the trunk.

3,371,832
MOVABLE SPARE TIRE HOLDER
Kenro Sekino and Yasuo Murase, Toyota-shi, Japan, assignors to Toyota Motor Company Limited, Toyota-shi, Japan, a corporation of Japan
Filed Oct. 11, 1966, Ser. No. 585,881
Claims priority, application Japan, Oct. 18, 1965, 40/64,020; Apr. 21, 1966, 41/25,680
12 Claims. (Cl. 224—42.21)



Spare tire holders on rear-door automobiles have been operable only from the outside of the vehicle. The present invention relates to a spare tire holder that can be operated from inside the automobile and which is effective to swing the spare tire away from the rear door, allowing unimpeded use of the rear door.

3,371,833
GLASS KNIFE
Jerry S. Sutton, 2200 Pinewood Ave., B–3, Baltimore, Md. 21214
Filed Mar. 11, 1966, Ser. No. 533,681
6 Claims. (Cl. 225—2)



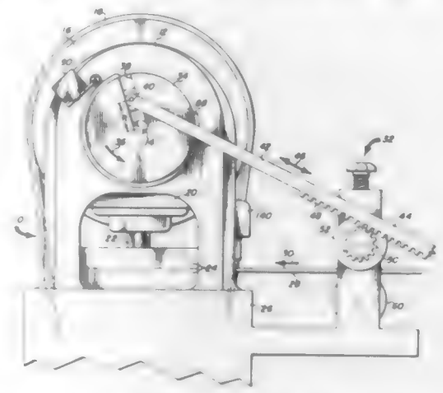
This is a method and especial apparatus for making glass knives, useful in microscopic biology. Essential elements include a base, a round linear fulcrum set in the base, cushion-like cover for the fulcrum to hold the glass precisely in position and a pressure element which swings onto the glass by means of a micrometric pressure applying screw. The fracture of the glass is accurate and the glass free of defects.

ERRATUM

For Class 226—17 see:
Patent No. 3,371,916

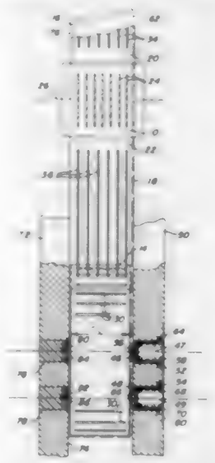
3,371,834
WEB FEED SYSTEM PROVIDING AN AUXILIARY CORRECTING FEED MOVEMENT
Samuel P. Willits and William L. Mohan, Barrington, Ill., assignors to Spartanics, Ltd., Palatine, Ill., a corporation of Illinois
Filed Dec. 16, 1965, Ser. No. 514,228
8 Claims. (Cl. 226—27)

A feed length correcting apparatus for cyclically operating press machinery intermittent strip feed devices operable during a portion of the machine cycle. With a main drive system coupled through an over-running clutch to the feeding elements, an auxiliary feed drive mechanism is also coupled to the feeding elements to impart supplemental motion to effect repositioning of the strip material during intervals when main feed and press are not



acting on the strip, if and when and in an amount desired or, automatically under the control of a sensor scanning a characteristic of the strip material.

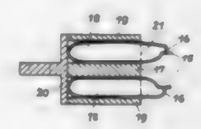
3,371,835
WEB TRANSPORT WITH SKEW CONTROL
Robert A. Pendleton, Dedham, Mass., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Oct. 14, 1965, Ser. No. 495,900
11 Claims. (Cl. 226—50)



A mechanism for controlling web skew in a web transport wherein at least one capstan defines a curved path portion that is followed by the web. A pressure button bears resiliently against one web edge, making contact with an edge segment that is small relative to the curved path portion defined by the capstan. The action of the pressure button urges the opposite web edge into contact with a fixed guide surface, thus providing web skew control.

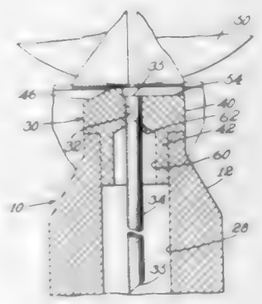
3,371,836
DEVICE FOR MAKING SEMICONDUCTOR ARRANGEMENTS
Hermann Forster, Schwarzenbruck, near Nuremberg, Horst Irmler, Nuremberg, Samuel Pfandler, Behringersdorf, near Nuremberg, and Winfried Schierz, Roth, near Nuremberg, Germany, assignors to Semikron Gesellschaft für Gleichrichterbau und Elektronik m.b.H., Nuremberg, Germany
Filed Aug. 3, 1964, Ser. No. 387,047
Claims priority, application Germany, Aug. 5, 1963, S 86,552
4 Claims. (Cl. 228—40)

1. An apparatus for use in applying terminals to semiconductors in which a resilient U-shaped yoke has the free ends of legs thereof attached to opposite faces of the semiconductor and the closed end of the yoke is cut apart to form the terminals, said apparatus comprising; a bar-like holder, a plurality of recesses extending into one side of the holder, each recess having a depth less than the length of a yoke so that a yoke introduced into a recess closed end foremost will have its free ends exposed, the lateral dimension of each recess being less than the distance across the legs of a yoke when the free



ends of the yoke are in engagement in a yoke when disposed in a recess will have its ends urged resiliently against each other so as to be able to grip a semiconductor therebetween, a member having a cavity therein for treatment material for treating the exposed ends of said yokes when the yokes are in said holder, and cooperating elements of guide means on said holder and member to guide the holder into assembled position with said member so yokes in said holder will have their projecting ends disposed in said cavity of said member.

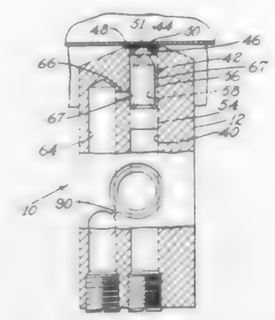
3,371,837
SOLDER APPLICATORS
Frederick S. Sillars, Beverly, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey
Filed Dec. 13, 1965, Ser. No. 513,258
7 Claims. (Cl. 228—43)



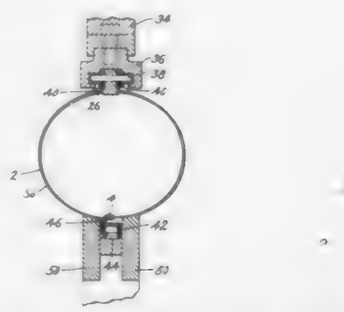
1. In a machine for applying solder to the side seams of moving can bodies, an applicator comprising a base member having a first solder passageway and an orifice member removably mounted on said base member having a discharge passageway of smaller diameter than said first passageway and terminating at an interior portion of the first passageway below the uppermost confine of said first passageway whereby solder discharged from the applicator is drawn from a level which is below the uppermost level of the said first solder passageway.

3,371,838
SOLDER APPLICATORS
Frederick S. Sillars, Beverly, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey
Filed Dec. 13, 1965, Ser. No. 513,259
9 Claims. (Cl. 228—43)

1. An applicator for applying solder to the side seams of moving can bodies having means for discharging a stream of solder and means for surrounding said discharge means and said stream with an envelope of pressurized gas thereby to prevent clogging of said discharge means.



3,371,839
SIDE SEAM SOLDERING MACHINES
Frederick S. Sillars, Beverly, Mass., assignor to United Shoe Machinery Corporation, Boston, Mass., a corporation of New Jersey
Continuation-in-part of application Ser. No. 348,932, Mar. 3, 1964. This application July 21, 1964, Ser. No. 385,552
9 Claims. (Cl. 228—44)

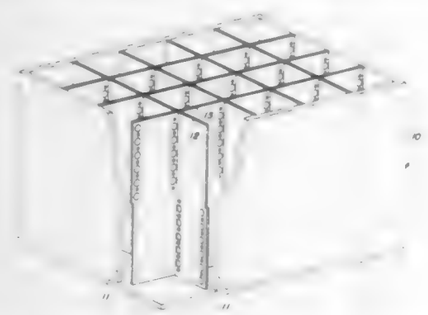


A conveyor chain for use in side seam soldering machines having a plurality of spaced presser lugs which cooperate with feed means for feeding, alining and produring pressure at the overlapping layers of a conventional interlocked container body. The pressure lugs engage the outermost surface of the overlapping portion of the side seam of container bodies at a point spaced from the circumferential terminus of the outer overlapping layer to ensure a close relationship between the overlapping layers of the side seam.

3,371,840
RECEPTACLE SPACER
Wilfred C. Schlager, Chicago, Ill., and James R. Zimmerman, Pontiac, Mich., assignors to Uniroyal, Inc., New York, N.Y., a corporation of New Jersey
Filed May 9, 1966, Ser. No. 548,519
9 Claims. (Cl. 229—15)

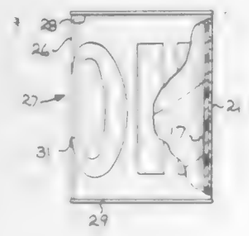
An interlocking cell-forming receptacle spacer of the type having partition members each provided with a plurality of parallel slots extending about half-way in from one edge to permit inverted transverse interfitting. The partition members are made of plastic material and each is provided on both surfaces, by means of suitable forming techniques, with a plurality of pairs of parallel columns of dome-shaped surface projections, each such pair of columns being located between the opposite edge of the partition member and the innermost end of an associated slot and being substantially tangentially aligned with the respective opposite side boundaries of the associated slot.

Upon interfitting of the partition members, each slot boundary-defining portion of each such member is received



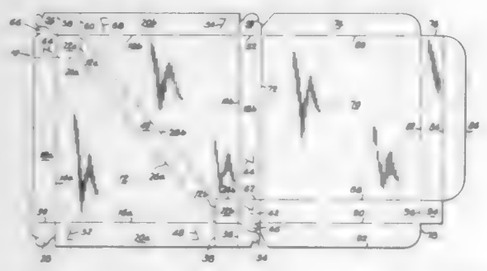
and laterally confined between respective backed-up pairs of columns of such surface projections of a transverse partition member.

3,371,841
CYLINDRICAL ARTICLE
James C. O'Neal, Jr., Toledo, Ohio, assignor to Owens-Illinois, Inc., a corporation of Ohio
Filed Jan. 3, 1967, Ser. No. 606,929
3 Claims. (Cl. 229—4.5)



This application discloses the construction of a cylindrical article having utility in the manufacture of can-type containers and comprising inner and outer plies of thermoplastic material bonded to one another by a suitable adhesive. The inner and outer plies of the article are formed from spirally-wound strands of thermoplastic material. The application also discloses a spiral-winding method for forming such a cylindrical article in which a cooling medium is circulated through the winding mandrel to reduce frictional forces between the article being formed and the winding mandrel.

3,371,842
FOLDABLE CONTAINERS
Martin M. Hechtmann and Ethel Herbst, New York, N.Y., assignors of one-fourth to Joseph Mandell, New York, N.Y.
Filed Aug. 10, 1966, Ser. No. 571,542
10 Claims. (Cl. 229—33)

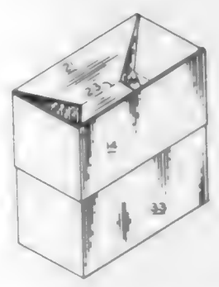


1. A container consisting of a foldable sheet structure which initially has the form of a flat blank and which can be folded from said blank into a container having a flat bottom wall and side walls extending upwardly therefrom, said bottom wall having a periphery defined by two pairs of opposed parallel side edges and said bottom wall also including two pairs of diagonally opposed corners, and said sheet structure including foldable means extending diagonally across said bottom wall between one of said pairs of opposed corners for displacing said bottom wall between an expanded condition where said bottom wall has no folds and the other of said pairs of opposed corners are relatively distant from each other and a contracted condition where said bottom wall is in a partly folded condition and said other pair of opposed corners are closer to each other than in said expanded condition, so that said foldable means of said bottom wall enables the container to assume two different sizes.

3,371,843
TRAY-LIKE CONTAINER
Joseph J. Hainey, Pawtucket, R.I., assignor to Winthrop-Atkins Co., Inc., Middleboro, Mass., a corporation of Massachusetts
Filed Feb. 1, 1966, Ser. No. 524,305
8 Claims. (Cl. 229—34)

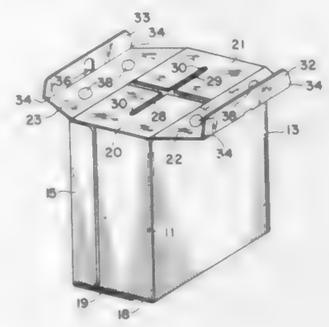
A tray-like container having a flat bottom and hollow rim members peripherally thereof. The rim members are dimensioned so that they can be collapsed to lie flat against the bottom and when erected are automatically connected to each other by interengaging locking elements provided for the purpose.

3,371,844
CONTAINER
Theodore Perrella, 1203 Penn St., Leesburg, Fla. 32748
Filed Dec. 21, 1965, Ser. No. 516,213
6 Claims. (Cl. 229—37)



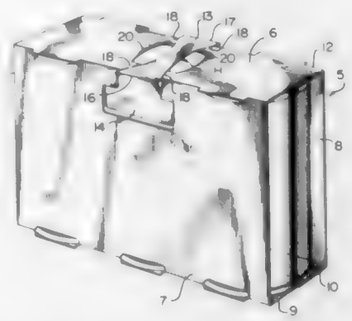
A collapsible container formed from a single blank which may be folded to lie flat for shipping; be erected by pushing the ends of the folded blank toward each other and closed by telescoping the upper portion of the container over the lower portion. The blank comprises lower side and end rectangular panels with bottom forming flaps hingedly connected thereto, upper side and end panels corresponding to the lower side and end panels, and cover forming panels interposed between the upper and lower side and end panels and hingedly connected to both. The cover forming panels are provided with median longitudinal score lines whereby to bend and project inwardly to form the cover when the outer portion of the container is telescoped over the lower. The side cover forming panels are provided with cut out portions to accommodate the infolding end cover forming panels.

3,371,845
RECLOSABLE CARTON
David J. Freiman, Corning, N.Y., assignor to Corning Glass Works, Corning N.Y., a corporation of New York
Filed June 22, 1967, Ser. No. 648,113
4 Claims. (Cl. 229—39)



A carton structure designed for automatic machine sealing after filling, with the overlapping glue-sealed flaps on one end thereof having interlocking tongue and slot portions to lockably reclose such carton once the glue-seal is broken.

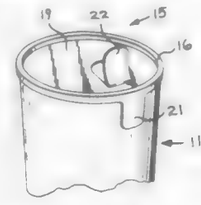
3,371,846
CARRYING HANDLE FOR PACKAGES
Josef Detzel, 37 Brodkorbweg, 896 Kempten, Germany
Filed Feb. 9, 1967, Ser. No. 614,962
10 Claims. (Cl. 229—40)



This disclosure has to do with providing a package with a handle wherein the handle is formed from the material of a carton of the package and is initially integrally connected thereto but is separated therefrom when a lifting force is applied thereto. The handle remains interlocked with the carton at all times.

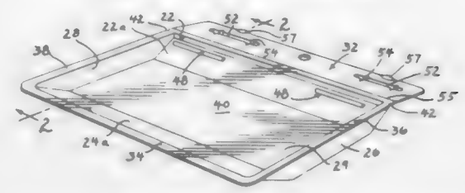
3,371,847
CONTAINER AND CLOSURE MEANS THEREFOR
Edward James Stengle, Jr., Toledo, Ohio, assignor to Owens-Illinois, Inc., a corporation of Ohio
Filed Dec. 3, 1965, Ser. No. 511,532
4 Claims. (Cl. 229—43)

This invention covers a two-piece closure for a composite container or a beaded tumbler having a first member of soft resilient rubber-like material with a depressed central panel located slightly internally of the container and an integrally formed U-shaped flange which snugly engages the container rim and, as a second member, a thin disc of a rigid material which overlies the central panel of the first member and urges the leg of the flange



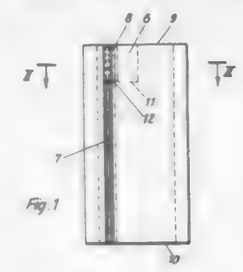
of the first member into sealing engagement with the inside surface of the container wall; also covers the combination of such a closure with a container.

3,371,848
RECLOSABLE PACKAGE
Frank A. Ward and William P. Jacobson, Rockford, Ill., assignors to Anderson Bros. Mfg. Co., Rockford, Ill., a corporation of Illinois
Filed Oct. 24, 1966, Ser. No. 588,825
15 Claims. (Cl. 229—45)



1. A reclosable package comprising: a container having means defining an open end and an outwardly extending peripheral flange at the open end, a flexible cover member sealed to the flange and providing a sealed closure for the open end, said flange arranged for breaking off one portion thereof from the remainder of the container along a preselected line while the cover member remains sealed thereto, the cover member being peelable from a part of the remainder of the flange as said one flange portion is lifted, first and second interfitting means for holding the cover member in a reclosed position overlying the open end, the first interfitting means being on the one flange portion outwardly of said preselected line and the second interfitting means being on the remainder of the container inwardly of the preselected line, and the one flange portion movable downwardly after peeling of the cover member to a position adjacent the second interfitting means for engagement of the first interfitting means therewith to hold the cover in a reclosed position.

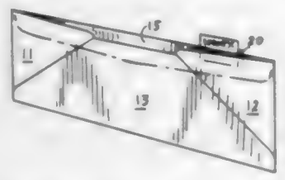
3,371,849
VALVED BAG OF PLASTIC MATERIAL SHEETING
Kurt Rochla, Lengerich, Germany, assignor to Windmöller & Hölscher, Lengerich, Germany
Filed Aug. 19, 1965, Ser. No. 480,898
Claims priority, application Germany, Mar. 11, 1965, W 38,735; May 15, 1965, W 39,164
1 Claim. (Cl. 229—62.5)



1. A valved bag comprising a tube of plastic material, said bag tube having at least one longitudinal tube forming heat seal seam, a tube closing heat seal seam at each

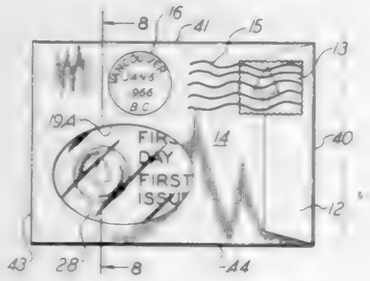
of the two ends thereof, and further comprising an internal valve sleeve of plastics material being secured to said bag tube by means of said tube forming seam, said valve sleeve having two walls which are welded together by a heat-sealed flat seam at least in the region of said tube forming seam, said two walls of said valve are connected by a fold and said flat seam extends along the fold connecting said two walls.

3,371,850
CONVERTIBLE ENVELOPE
Joseph Gorman, 2514 W. Berwyn Ave., Chicago, Ill. 60625
Filed Mar. 7, 1967, Ser. No. 621,268
1 Claim. (Cl. 229—68)



A letter or business paper envelope including a perforated tab integral with the sealable flap of the envelope. When separated from the flap, the tab may be used as a file indicator with the flap tucked in the envelope pocket. When the tab is inserted in the envelope pocket, the flap may be secured to the back of the envelope for mailing.

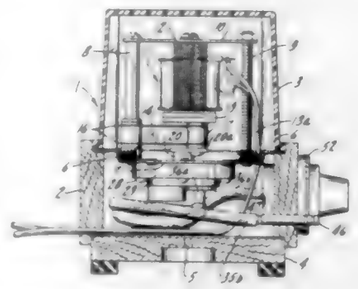
3,371,851
TAMPER-PROOF COIN PACKAGE AND METHOD OF MAKING SAME
Harold B. Silene, Dana Point, and Roger E. Haas, Temple City, Calif., assignors to 99 Coin Company, San Clemente, Calif., a limited partnership of California
Filed May 16, 1966, Ser. No. 550,220
7 Claims. (Cl. 229—92.9)



A coin package and the method of making the package involving an outer envelope comprising a flat tube folded double so as to have a single exterior flap sealable across a single access opening and enclosing a coin holder with an aperture for a coin. The coin holder and coin in the aperture are shielded by a transparent membrane on obverse and reverse sides of the coin such that the coin is visible when the holder and coin are placed in the tubular doubled envelope subsequent to the incising of a window through the envelope after the envelope has been stamped and postmarked.

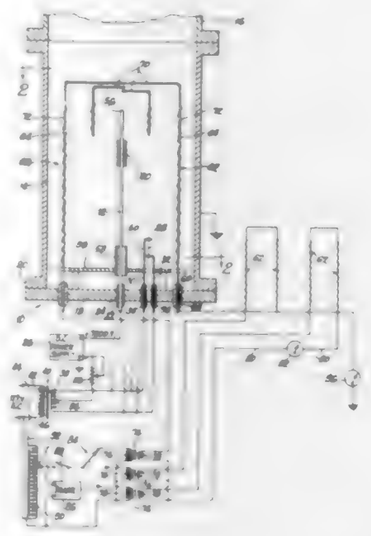
3,371,852
AIR PUMP ASSEMBLY
Harley R. Holt, River Forest, Ill., assignor to Ray-Wayland Corporation, Chicago, Ill., a corporation of Illinois
Filed June 16, 1966, Ser. No. 558,102
8 Claims. (Cl. 230—55)

1. In an air pump assembly, an air pump having a reciprocating shaft and means for supporting said shaft including a pair of spaced, parallel leaf spring elements, each of said elements being fixedly secured adjacent one of their ends to a support and being fixedly secured adja-



cent their opposite ends to said shaft, said elements normally extending in a plane perpendicular to the longitudinal axis of said shaft.

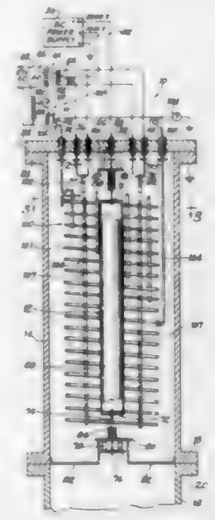
3,371,853
ORBITRON VACUUM PUMP WITH GETTER VAPORIZATION BY RESISTANCE HEATING
Joseph C. Maliakal, Waltham, Mass., assignor to Wisconsin Alumni Research Foundation, Madison, Wis., a corporation of Wisconsin
Filed June 17, 1966, Ser. No. 558,383
19 Claims. (Cl. 230—69)



1. An ion getter vacuum pump,
comprising the combination of a generally cylindrical casing constituting an outer electrode,
means for connecting the interior of said casing to a vacuum system to be evacuated,
a central electrode extending along the axis of said outer electrode,
said central electrode being generally cylindrical and of a small diameter relative to the diameter of said outer electrode,
means for compressing a positive voltage between said inner and outer electrodes to produce a generally cylindrical electric field therebetween,
a thermionic cathode disposed between said inner and outer electrodes and toward one end of said inner electrode for introducing electrons into said electric field with initial angular momentum about said inner electrode,
said electrons traveling in spiral orbits around said inner electrode,
at least one pair of heating rods extending longitudinally in the space between said inner and outer electrodes,

said rods being spaced outwardly of said cathode and inwardly from said outer electrode,
getter material in the form of titanium wire wound around said rods,
said rods of each pair being connected together at one end,
and means for supplying electrical current to the opposite ends of said rods to cause the current to pass along said rods so as to heat said rods and thereby cause vaporization of titanium from said wire,
the evaporated titanium being condensed on the inside of said outer electrode.

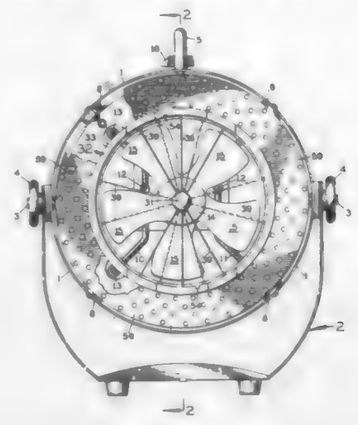
3,371,854
HIGH CAPACITY ORBITING ELECTRON VACUUM PUMP
Raymond G. Herb, Madison, Wis., assignor to Wisconsin Alumni Research Foundation, Madison, Wis., a corporation of Wisconsin
Filed July 27, 1966, Ser. No. 568,170
22 Claims. (Cl. 230—69)



1. In an ion vacuum pump,
the combination comprising a hollow generally cylindrical boundary electrode,
means forming an enclosure for connecting the interior of said boundary electrode to a vacuum system to be evacuated,
an inner electrode disposed centrally in said boundary electrode,
means for impressing a positive voltage between said inner and boundary electrodes to produce a generally cylindrical field therebetween,
and means for introducing electrons into said field between said inner and boundary electrodes with initial angular momentum so that the electrons will travel in spiral orbits around said inner electrode,
said inner electrode comprising a substantially cylindrical member of relatively large diameter,
at least one end of said cylindrical member having a generally axial supporting member of relatively small diameter connected thereto whereby the electric field at said end of said cylindrical member is favorable for efficient orbiting of electrons.

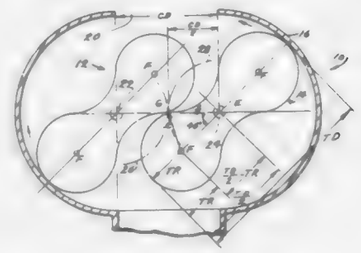
3,371,855
AIR DIRECTING DEVICE
Herbert F. Bruns, 3520 Segovia St., Coral Gables, Fla. 33134
Filed Feb. 25, 1966, Ser. No. 530,139
9 Claims. (Cl. 230—120)

An air directing device consisting of a cylindrical orifice with a power driven fan positioned at one end thereof including a plurality of veins positioned in predetermined relation around the inner periphery of said orifice for cre-



ating a plurality of jet streams of air resulting in a relatively long range discrete coherent column of moving air moving from the device when said fan is energized.

3,371,856
MODIFIED CYCLOIDAL IMPELLER
Francis H. Thelen, Tujunga, and Thomas M. Thomas, Downey, Calif., assignors to Fuller Company, Catasauqua, Pa., a corporation of Delaware
Filed Mar. 24, 1966, Ser. No. 537,209
2 Claims. (Cl. 230—141)

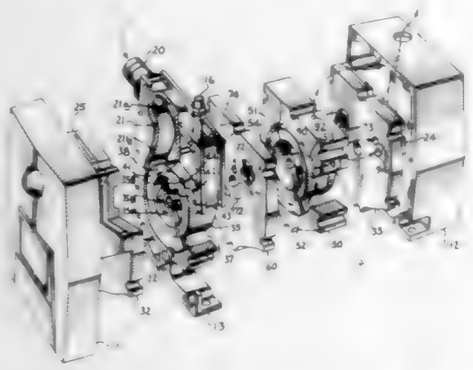


1. Fluid handling apparatus of the rotary positive displacement type comprising a pair of lobed impellers mounted on parallel shafts and rotatable at a constant velocity ratio, each of said impellers having a central waist portion adapted to be mounted on one of said shafts and a plurality of identically shaped lobe portions extending radially outwardly from said waist portion, the profile of each of said impellers consisting of a like plurality of identical convex circular arcs of uniform radius defining said lobe portions and a like plurality of identical concave non-circular curves defining said waist portion, each of said arcs subtending an angle at the axis of the impeller shaft equal to $360°/2n$, where n is the number of said lobe portions, and each of said non-circular curves being generated from a circular arc identical with those defining said lobe portions so that, when said impellers are rotated in opposite directions at the same velocity, there is substantially point contact between said impellers at all positions of relative rotation.

3,371,857
MULTISTAGE VACUUM PUMP
Joseph A. LeBlanc, Jr., Chicago, Ill., assignor to Precision Scientific Company, Chicago, Ill., a corporation of Delaware
Filed Oct. 24, 1965, Ser. No. 504,942
8 Claims. (Cl. 230—152)

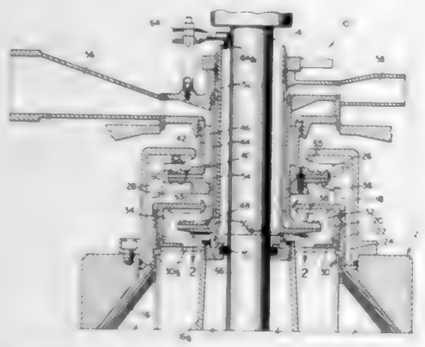
An improved multistage vacuum pump of the internal vane type of substantially any desired capacity may be built from standardized parts by varying the axial dimensions of the rotor, vanes and stator of the intake stage

(i.e., the same radial dimensions are employed throughout for all pump capacities). The desired objectives are achieved by employing a pair of pumping units arranged side-by-side with a separator plate imposed between the two units and a pair of end plates disposed at opposite ends of the two units. In place of separate gas passageways through the pump separator plate ordinarily found in multi-stage vacuum pumps, axial passageways extending completely through the rotors and the separator plate



are provided to achieve stage-to-stage gas passage. Cavities are provided in the end plates and the separator plate in order to permit transfer of gas from the outlet cavity of the intake stage into the rotor hollows and from the hollows of the rotors to the intake cavity of the exhaust stage. Supplementary outlet cavities are provided in order to permit the exhaust of large volumes of gas during the relatively high pressure start up phases of pump operation.

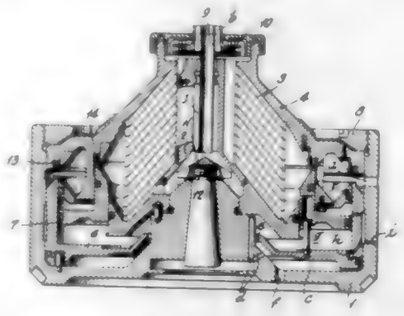
3,371,858
CENTRIFUGE DISCHARGE MEANS
Leonard Shapiro, Upper Darby, Pa., assignor to Pennsalt Chemicals Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed Mar. 17, 1966, Ser. No. 535,184
3 Claims. (Cl. 233—14)



In a centrifuge equipped with an annular groove which opens inwardly toward the rotational axis for receiving a skimmer disc, scattering of pasty fluid from the bowl is eliminated by providing the skimmer disc with an axially extending baffle extending into the groove and also by providing the bowl with radial vanes immediately outward of the groove.

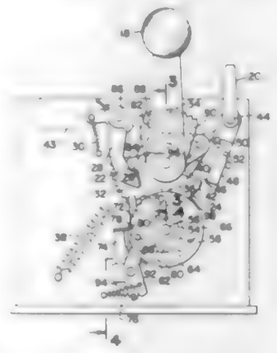
3,371,859
DRUM OF DISC BOWL CENTRIFUGE FOR SEPARATING LIQUID MIXTURE
Ivan Vasilievich Lyskovtsov, Varshavskoe Chaussee, 180, Korpus 2, kv. 30, Moscow, U.S.S.R.
Filed July 14, 1965, Ser. No. 471,935
1 Claim. (Cl. 233—20)

A drum for a disc bowl centrifuge for separating liquid mixtures containing non-fluid fractions, including a body, a holder provided with discs mounted in the body, a working chamber constituted by the spaces between the discs, a reservoir for accumulating the non-fluid fraction arranged behind and concentrically with respect to the working chamber, discharge slots in the body serving to discharge the non-fluid fraction from the reservoir due to centrifugal forces, a first piston within the body for



closing and opening the discharge slots, a second piston operably related to the first piston and body for cutting-off a portion of the reservoir and said second and first pistons alternately moving along the axis of the drum for bringing the cut-off portion of the reservoir into communication with the working chamber and with a receiver for the non-fluid fraction located exteriorly of the drum via the discharge slots.

3,371,860
CONTROL MECHANISM FOR METERING DEVICES
Leif J. Sundblom, Castro Valley, Calif., assignor to Rockwell Manufacturing Company, Statesboro, Ga., a corporation of Pennsylvania
Filed Feb. 1, 1967, Ser. No. 613,333
4 Claims. (Cl. 235—94)

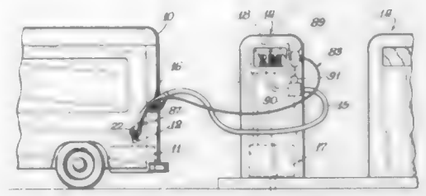


Manual controls and interlock means are provided for sequentially maintaining a display of a registered amount on the face of a computing meter such as a gasoline pump, when the pump is "off," releasing at will a resetting mechanism independent of any movement of the control lever, setting the control lever to a registering position, and winding the reset mechanism for the next reset operation by the return of the control lever to the off position.

3,371,861
DEMAND CONTROL APPARATUS
Elma D. Cudmore and John G. Cudmore, both of 1255 Valley, Bannockburn, Ill.
Filed Oct. 19, 1965, Ser. No. 498,037
11 Claims. (Cl. 235—132)

11. A mechanism for use with a fuel tank having a filling tube with an opening therein, which tank is filled from a source of fluid by a filling apparatus having a rotating measuring means, said mechanism including: a body apart from said apparatus and adapted to be affixed to said tube and having an opening registering with said

fill tube opening when so affixed; demand means attached to said body and adjustable to be preset to indicate the desired quantity of fluid to be added to said container; and drive apparatus detachably connected to said filling



apparatus and connected to said means, said drive apparatus including means, when said filling apparatus is supplying fluid, effective to subtract from the indication on the demand means the amount of fluid measured by said measuring means.

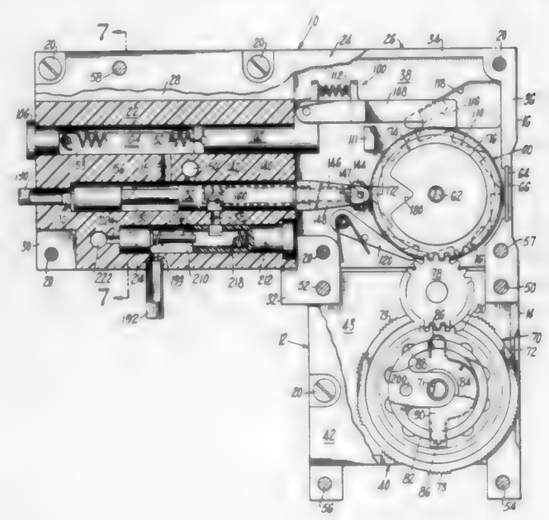
3,371,862
FORCE BALANCE APPARATUS
Hoel L. Bowditch, Foxboro, and Philip H. Sanford, Walpole, Mass., assignors to The Foxboro Company, Foxboro, Mass.
Original application July 2, 1965, Ser. No. 469,259, now Patent No. 3,325,098, dated June 13, 1967. Divided and this application May 22, 1967, Ser. No. 640,075
12 Claims. (Cl. 235—200)

A pneumatic computer for multiplying, dividing, squaring or square-rooting wherein the mathematical result is achieved through balancing two transversely-directed forces, each proportional to a corresponding signal pressure, by an angularly-adjustable reaction element, there being provided a selector plate orientable into different positions to control the pattern of pneumatic connections to the force-producing devices thereby to determine the particular mathematical computation performed.

3,371,863
FLUID-OPERATED COUNTING DEVICE
John H. Bickford, Middletown, Ira B. Crilly, Simsbury, and Igor Blinow, Hebron, Conn., assignors to Veeder Industries Inc., Hartford, Conn., a corporation of Connecticut
Filed June 17, 1966, Ser. No. 558,479
34 Claims. (Cl. 235—201)

A pneumatically operated single wheel predetermining counter adapted to be mounted in a bank thereof to provide a plurality of coaxial counter wheels and a plurality of coaxial predetermining wheels. A reciprocable pneumatic relay valve is adapted to be cycled by an air pulse to connect a transverse passage in the counter providing an air supply plenum to actuate a piston in one reciprocable direction against the bias of a return spring. The return spring, upon the cessation of the air pulse, returns the piston to index the counter wheel. A cam is provided on the counter wheel to control the reciprocable motion of the relay valve and to provide a transfer pulse to the adjacent higher order single wheel counter in the bank when the counter wheel is in its "9" position.

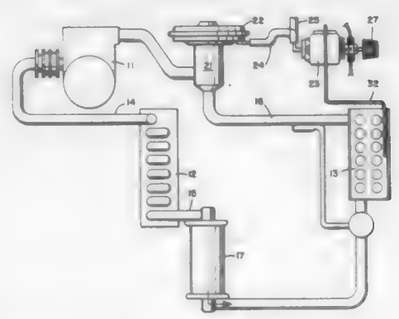
A reset valve is interposed in the transfer passage and is adapted to be pneumatically actuated against the bias of a return spring to close off this passage. For this purpose there is provided a second transverse passage in the counter providing a reset plenum, and the counter wheels are adapted to be reset by (1) connecting the reset plenum to a source of air pressure, (2) pneumatically actuating the relay valve of the lowest order single wheel counter of the bank and (3) supplying air pulses to the air supply



plenum. The transfer cam on the counter wheel provides for retaining the counter wheel in its "9" position such that all of the counter wheels will then be indexed to "0" by the operating piston return springs when the reset operation is discontinued.

The predetermining section of the counter comprises a predetermining rotor with an axially extending passage which is adapted to be aligned with passage sections in the housing to provide an air pulse when the preselected count is reached.

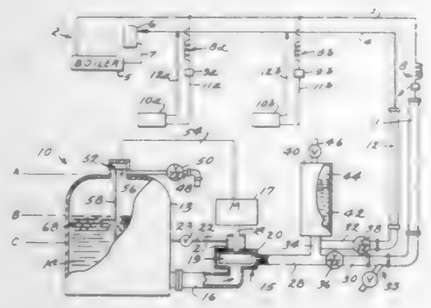
3,371,864
VALVE REGULATOR MECHANISM
James U. Daly and George P. Saliaris, Worthington, Ohio, assignors to Ranco Incorporated, Franklin County, Ohio, a corporation of Ohio
Filed Dec. 15, 1966, Ser. No. 602,102
3 Claims. (Cl. 236—86)



A vacuum regulator **35** and an expansible type thermostatic element **36** are supported on a frame comprised of two side plates **96**, **97** interconnected by a face plate **115**. The vacuum regulator is adapted to be connected to a source of vacuum which may vary, such as the intake manifold of an intake manifold of an internal combustion engine, not shown, through a tube **25** and is adapted to draw a vacuum in a tube **24** which has a subatmospheric pressure which is regulated so that it varies only in accordance with temperatures sensed by the element **36**. The regulation of the vacuum in tube **24**

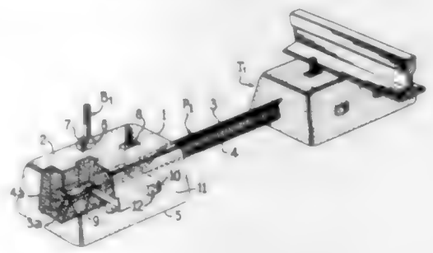
is effected by providing a chamber **43** in communication with the tube **24** and having a valve port **51** to control the connection of the chamber with the tube **25** and the source of vacuum. The port **51** is adapted to be closed by a valve **70** on a flexible diaphragm **56** which forms one wall of the chamber **43**. The valve **70** is adapted to close on a port **78** which is formed on a disc **71** attached to the diaphragm and which surrounds the port **51**. When the port **78** is open, atmosphere is admitted into the chamber. The disc **71** and the central portion of the diaphragm **56** are shifted to open and close one or the other of the ports **51** or **78** by a bail structure attached to the disc **71** in the form of legs **76**, **77**, which extend through apertures in the diaphragm, and a pin **80** attached to the legs. The pin **80** is positioned by the action of a liner **37** pivoted between the side plates **96**, **97** and which engages the element **36**. A spring **101** biases the lever **37** to the element **36** and the pressure imposed by the lever on the element is selectively variable by a lever **138**, to which one end of the spring is attached, which lever is movable about its pivot by a cam disc **153**. The lever **37** is connected with the pin **80** by a deflectable arm **81**, the angular position of which can be finely adjusted by a screw **113** arranged to deflect the arm according to rotary adjustment of the screw. The vacuum regulator is calibrated in one respect by this adjustment.

3,371,865
DEAERATING APPARATUS
Gene W. Ross and David S. Ross, Lorain, Ohio, assignors, by mesne assignments, to Ritter Pfaudler Corp., Rochester, N.Y., a corporation of New York
Filed May 20, 1966, Ser. No. 551,677
8 Claims. (Cl. 237—68)



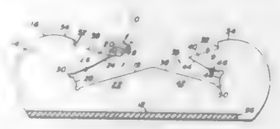
1. Liquid degasifying apparatus comprising:
a degasification tank for containing a batch of liquid which is to be degasified;
vent valve means in communication with the top of said tank for sealing said tank against ingress of fluid when closed and for passing gases out of said tank when open;
a liquid receiving conduit for receiving liquid from said tank; and
means for producing a vacuum in said tank thereby to degasify liquid in said tank and for conducting substantially completely degasified liquid from said tank to said liquid receiving conduit, said means including a pump for withdrawing liquid from said tank whereby when said vent valve means is closed a degasifying vacuum may be produced in said tank, said pump having an inlet disposed below the liquid level in said tank and an outlet, said outlet being connected to said liquid receiving conduit, a holdup tank of lesser volume than said degasification tank and having an upper and a lower portion, said lower portion containing a liquid and being in communication with said liquid receiving conduit, said upper portion containing a gas cushion compressible by liquid in said lower portion and sealed from the atmosphere; and a liquid control valve in said liquid receiving conduit and located more remotely from said pump than the point of communication between said conduit and said holdup tank;
whereby when said vent valve and control valve are closed and said pump is operated, the first-pumped portion of liquid which is withdrawn liquid from said degasification tank is forced into said lower portion of said holdup tank against said gas cushion and whereby when said liquid control valve is subsequently opened, substantially completely degasified liquid is passed from said degasification tank through said liquid control valve.

3,371,866
REINFORCED CONCRETE RAILWAY TIE
Roger Paul Sonneville, 5 Rue Maurice Ravel, Saint-Cloud, Seine-et-Oise, France
Filed July 6, 1965, Ser. No. 469,739
Claims priority, application France, Jan. 13, 1965, 1,723
4 Claims. (Cl. 238—58)



Railway tie comprising two spaced blocks of reinforced concrete, a steel stay having two ends embedded in the two blocks, the stay being in the form of an L-section member which consists of two flanges and is so disposed in the space between the two blocks that the plane bisecting the dihedron formed by the two flanges is substantially horizontal.

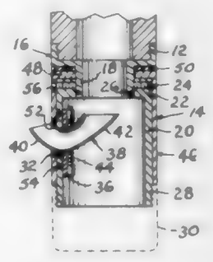
3,371,867
RAILWAY TIE ANCHOR
Adam Gehnert, 500 E. Benham St., Glendive, Mont. 59330
Filed Nov. 14, 1966, Ser. No. 593,864
10 Claims. (Cl. 238—315)



A railway tie anchor having wall portions upstanding from a base, each of said wall portions having at least one slot identical to a slot in the other, each slot intersecting the upper edge of the wall and extending toward the base at an angle therewith, the slot conforming generally to the contour of the rail flange portion to be gripped, with the vertical height of the anchor being such that when installed on a rail a portion thereof extends into abutting relationship with a rail supporting cross tie to anchor the tie longitudinal of the rail.

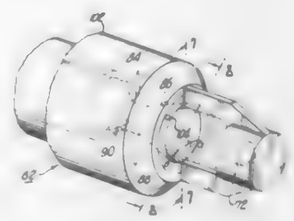
3,371,868
FAUCET FOUNTAIN
Bobby R. Abbott, 3808 SW. 40th Place, Oklahoma City, Okla. 73119
Filed July 18, 1966, Ser. No. 566,111
5 Claims. (Cl. 239—27)

1. A drinking fountain attachment for water faucets, comprising: a tubular body having coupling means at one end for connection with a faucet, said body having an opening in its wall; a door hingedly connected to the inner wall of said body and swingable toward and away from the opening; a conduit projecting through said door, said conduit having one upturned end portion intersecting the



stream of water flowing from said faucet when the latter is in use, said conduit having an opposite upturned end portion directing a portion of the stream of water outwardly and upwardly of said body as a drinking fountain stream when the door is in closed position; and means for opening and closing said door.

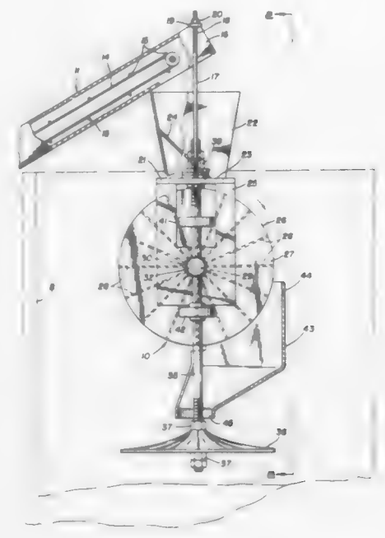
3,371,869
COMPRESSIBLE FLUID SONIC PRESSURE WAVE ATOMIZING APPARATUS
Nathaniel Hughes, Bronx, N.Y., assignor to Sonic Development Corporation of America, Yonkers, N.Y.
Original application Dec. 23, 1963, Ser. No. 332,502, now Patent No. 3,240,254, dated Mar. 15, 1966. Divided and this application Oct. 19, 1965, Ser. No. 511,010
3 Claims. (Cl. 239—102)



The atomizing apparatus comprises a nozzle having a diverging outlet section for accelerating a compressed gas to supersonic velocities. A cavity resonator member is positioned downstream from the diverging outlet section to amplify the shock waves created by the supersonic gas flow from the nozzle. Liquid to be atomized is injected into the boundary layers of the gas stream flowing in the nozzle so as to form the nozzle walls either with or without the assistance of solid metal. Liquid to be atomized also is injected into the gas stream outside of the nozzle. The liquid is atomized by the sonic pressure waves and other forces. The resulting spray has a high degree of uniformity of droplet particles size. The pertinent portions of the description in this divisional application are those describing FIGURES 6 through 8 and 11.

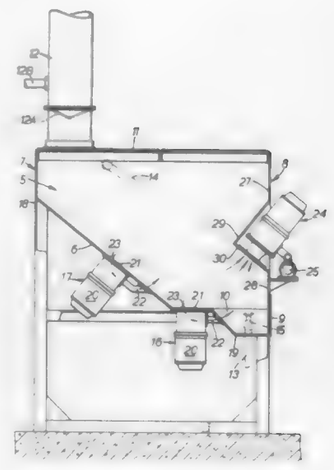
3,371,870
MATERIAL DISTRIBUTOR ATTACHMENT
Herbert W. Harrer, Rte. 1, New Washington, Ohio 44854
Filed June 28, 1965, Ser. No. 467,550
6 Claims. (Cl. 239—684)

A distributor for particulate materials having a paddle wheel driven by the gravitational flow of materials from a hopper and a rotary, material spreader arranged to be



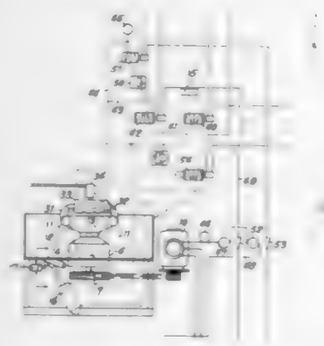
driven by a friction drive operating off of the paddle wheel.

3,371,871
WASTE DISPOSAL INSTALLATIONS
Thomas Cropper Ryley Shepherd, Arbour Hill, Herefordshire, Ross-on-Wye, England
Filed May 20, 1965, Ser. No. 457,402
5 Claims. (Cl. 241—43)



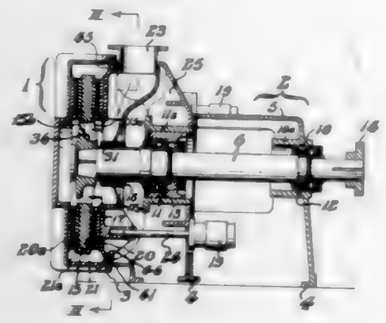
A waste disposal installation for the disposal of solid waste material particularly from office buildings or blocks of flats. The waste, together with water, is fed down a duct to be delivered on a sloping wall of a disposal chamber which leads down to a sump. Reducing apparatus in the wall of the chamber above the sump breaks up the large articles of waste and agitates the water in the chamber so that the reduced waste is dispersed in the water. The water containing dispersed waste passes out of an outlet above the reducing apparatus and is fed via a comminutor to drain. A grid may be positioned across the chamber above the comminuting apparatus with an overflow pipe leading from the chamber above the grid.

3,371,872
MIXER-GRINDER
Robert André Marcel Ronceray, 122 Ave. des Champs Elysees, Paris 8eme, France; Lena Sarah Yeomans, Andree Jacqueline Laure Ronceray, Francoise Monique Mary Ronceray, and Pierre Robert Ronceray, heirs of said Robert A. M. Ronceray, deceased
Continuation-in-part of application Ser. No. 365,993, May 8, 1964. This application Feb. 18, 1966, Ser. No. 528,513
Claims priority, application France, July 30, 1963, 26,753, Patent 89,802
3 Claims. (Cl. 241—132)



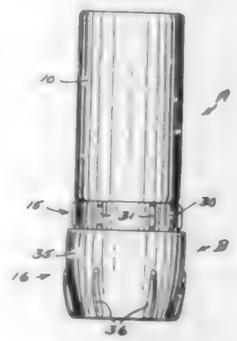
1. A mixer-grinder of the type described, comprising a stationary tank;
a driving unit consisting of a motor located outside of the tank and a reduction gear unit placed within said tank and having an output shaft;
an arm connected to the output shaft of the reduction gear unit;
at least two working members carried by said arm, one of said two working members being movable into and out of working position at any given time, said one working member being moved by said motor;
a power cylinder connected to said working members for controlling said movement into and out of said working position;
a source of air under pressure and a system controlling the flow of said air from said source to said power cylinder so that the power developed by the motor will be substantially constant during the operation of said one working member.

3,371,873
REFINING APPARATUS
Keith V. Thomas, 613 W. State St., Trenton, N.J. 08618
Continuation of application Ser. No. 297,737, July 23, 1963. This application Mar. 24, 1966, Ser. No. 537,244
14 Claims. (Cl. 241—163)



1. A refining apparatus comprising:
(A) a main frame including a stress receiving member,
(B) a rotatable drive shaft mounted in said main frame for rotational movement about its main axis,
(C) said stress receiving member of said main frame having a forwardly facing first flange, said stress receiving member being designed such that said flange will exhibit radial deflection symmetry relative to said main axis when subjected to radially symmetrical forces parallel to said main axis,
(D) a casing having a rearwardly facing second flange, said second flange being attached to said first flange at a sufficient number of spaced points to ensure that said casing cannot deflect independently of said stress receiving member, said casing being designed so as to exhibit radial deflection symmetry relative to said main axis of said drive shaft when subjected to radially symmetrical forces parallel to said main axis,
(E) a non-rotatable first refining plate attached to and supported by said casing, said plate having a first refining surface perpendicular to said main axis of said drive shaft, said plate being supported by said casing so that said plate cannot deflect independently of said casing,
(F) a rotatable plate support disc supported on the front end of said drive shaft for rotation with said drive shaft, said rotatable support disc being designed to exhibit radial deflection symmetry relative to said main axis of said drive shaft when subjected to radially symmetrical forces parallel to said main axis,
(G) a second refining plate having a second refining surface disposed parallel to and facing said first refining surface, said second refining plate being attached to and supported by said rotatable support disc so that said second refining plate cannot deflect independently of said rotatable support disc, and
(H) loading means to apply in a radially symmetrical fashion a force to said rotatable plate, said force being parallel to said main axis and in a direction tending to cause said refining surfaces to bear against one another,
whereby said refining surfaces will remain parallel to one another and perpendicular to said main axis of said drive shaft whenever axial deflections are sustained by said member, casing, disc, and/or plates.

3,371,874
PEPPER MILL
Stuart L. Reeves, 1440 SW. 67th 73159, and Clyde A. Reeves, 8601 NW. 18th 73127, both of Oklahoma City, Okla.
Filed June 3, 1965, Ser. No. 461,035
10 Claims. (Cl. 241—168)

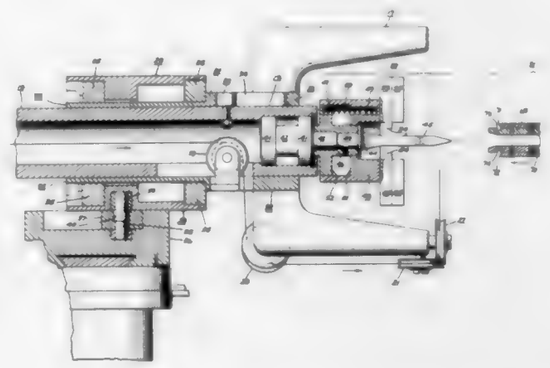


1. In a pepper mill, the combination of a first body portion, a second body portion, grinding means, and mounting means for operable attachment of said grinding means to said second body portion; said first body portion including a housing having means for attachment of said first body portion to a container, passageway means for enabling passage of material from an attached container to said second body portion, and a cylindrical peripheral portion, an endless groove extending about said cylindrical peripheral portion of said housing, and means operably connected with said grinding means; said second body portion including a guideway for receiving material passing through said first body portion from an attached container and guiding the same to said grinding means, a sleeve portion having a cylindrical inner face provided with a plurality of tabs projecting inwardly therefrom toward the axis of said cylindrical inner face, said tabs of said second body portion being received within said endless groove of said first body portion in juxtaposition to provide means for freely rotatable attachment of said second body portion to said first body portion; and said grinding means including a pair of cooperating members operably disposed for grinding action on rotation of one of said body portions with respect to the other through cooperative interaction of one of said cooperating members with said mounting means and cooperative interaction of the other of said cooperating members with said means of said first body portion operably connected with said grinding means.

3,371,875
LINER FOR CRUSHERS
Rudolph J. Gasparac, Milwaukee, and Arnold P. Szaj, Hales Corners, Wis., assignors to Nordberg Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Oct. 21, 1965, Ser. No. 499,427
5 Claims. (Cl. 241—299)

The invention relates to an improvement in bowl liners for crushers in which helical wedge receiving surfaces are employed, adjacent surfaces being helically disposed in opposite directions, whereby to provide a self-locking effect in response to the rotation of the bowl liner in either direction.

3,371,876
COIL WINDING MACHINE
Albert F. Wilcox, Yoder, Ind., assignor to General Electric Company, a corporation of New York
Filed Jan. 24, 1966, Ser. No. 522,753
8 Claims. (Cl. 242—9)



A flyer type winding machine for winding coils on a stationary coil form. A rotatable spindle carries the flyer that not only rotates with the spindle but also moves longitudinally along the spindle. A spindle arbor is positioned at one end of the spindle and is capable of being fixed in position in nonrotatable relationship with respect to the spindle. A turret arbor is nonrotatably supported on the machine for longitudinal movement relative to the spindle arbor. The turret arbor and the spindle arbor have cooperating and mating pieces which are securely locked when the turret arbor is advanced into engagement with the spindle arbor to provide the stationary coil form. The cooperating and mating pieces consist of a wedge and flange on the spindle arbor and consist of expandable jaws and flange on the turret arbor which permit a coil form to be adjusted to the desired shape and dimensions.

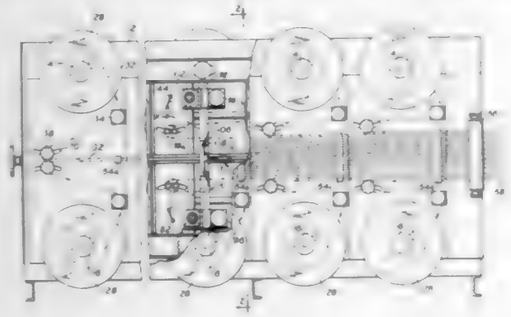
3,371,877
METHOD FOR PACKAGING MULTI-STRAND ROVING
Jerome P. Klink, James C. Belue and James H. Sears, Anderson, S.C., assignors to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Filed May 14, 1965, Ser. No. 455,866
9 Claims. (Cl. 242—18)

This invention relates to a multistrand roving and to a method of and apparatus for forming and attenuating streams of mineral material into fibers, segregating the fibers into groups or strands and winding a roving comprising the groups or strands in a package to provide a package with ends in parallel planes normal to the axis of the package, the method including compacting the strands or groups at the package ends whereby the package is of cylindrical shape throughout its length.

3,371,878
PAYOFF STAND
Oscar G. Garner, Westfield, N.J., assignor to General Cable Corporation, New York, N.Y., a corporation of New Jersey
Filed Nov. 16, 1964, Ser. No. 411,431
8 Claims. (Cl. 242—45)

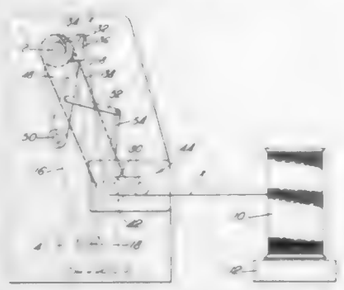
1. Wire strand supply apparatus including, in combination, a frame having a strand feed zone along which all strands from the apparatus are advanced substantially horizontally and substantially parallel to one another to a discharge end of the apparatus, the upper and lower limits of said feed zone being at a height from a floor for convenient handling of the strands during string up and change over by an operator standing on the floor, a plurality of rows of spindles supported by and extending

substantially horizontally from the frame including one row at a level above said feed zone and another row at a level below said feed zone, the spindles extending outwardly toward the operator, spools on the respective spindles for holding the strands of wire, guide means over which strands from the respective spools on the spindles pass to the strand feed zone, the guide means including a strand payoff guide for each spool and over which a strand passes as it comes from the spool, other guide means for the strand from each payoff guide including a



tensioning roll around which the wire strand passes beyond the payoff guide to said strand feed zone, the tensioning roll being in such position that the wire strand moves substantially horizontally and generally parallel to the strands in said feed zone and to the strands at all of the other tensioning rolls as the strand approaches and leaves said tensioning roll, and means for mounting each tensioning roll for movement substantially parallel to the wire strands in said feed zone and in accordance with the tension of the strand for obtaining uniform tension in the strands in said strand supply apparatus.

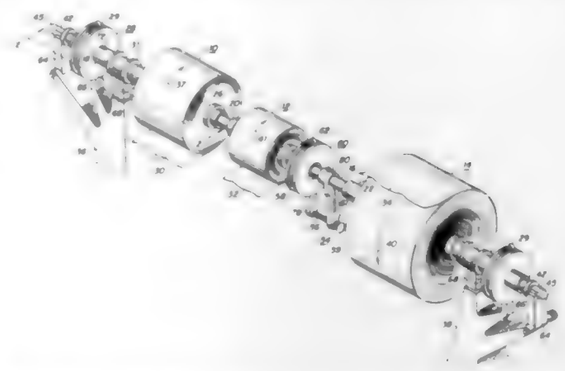
3,371,879
YARN WINDING APPARATUS
Moore Hill, Belfast, Northern Ireland, assignor to James Mackie & Sons Limited, Belfast, Northern Ireland
Filed July 16, 1965, Ser. No. 472,553
Claims priority, application Great Britain, July 20, 1964, 29,490/64
3 Claims. (Cl. 242—45)



A yarn winding or spooling machine having haul pulleys positioned to act upon the yarn between the let-off and take-up package spindles to positively drag yarn from the rotating let-off package, the haul pulleys being driven by a variable speed mechanism, means being provided to increase the speed of the haul pulleys and hence the rate of delivery of the yarn to the take-up package, as the diameter of the package being wound increases.

3,371,880
PAPER ROLL HOLDER
William J. Clisham, 18 Boyd St., Bangor, Maine 04401
Filed Jan. 10, 1966, Ser. No. 519,726
5 Claims. (Cl. 242—55.3)

This invention relates to a paper roll holder that permits each of a plurality of paper rolls mounted on a common shaft to pay off paper at a rotation rate that is independent of the rotation rate of the other rolls. Means

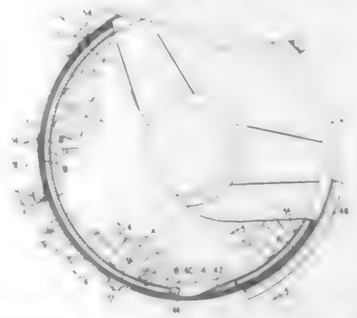


are provided to position each roll axially along the shaft and independently retard the rotation of each roll.

3,371,881
MAGNETIC RECORDING AND PLAYBACK APPARATUS
Charles F. Rose, Indianapolis, Ind., assignor to Radio Corporation of America, a corporation of Delaware
Filed Sept. 15, 1965, Ser. No. 487,534
12 Claims. (Cl. 242—55.12)

A fast forward mechanism for magnetic recording and playback apparatus includes a linkage provided to vary the bias between a clutch plate and drive pulley for the tape reel to control the rate of rotation of the reel.

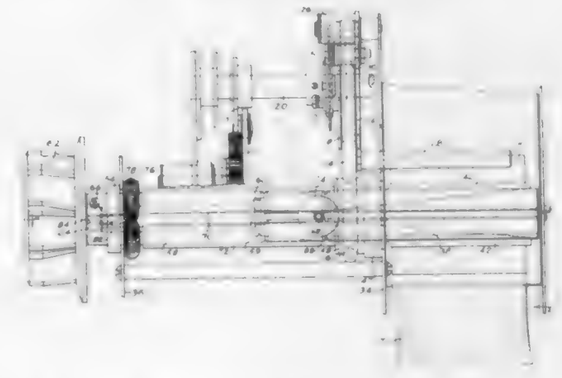
3,371,882
TOGGLE LATCHING REEL COVER WITH A SLIDING DOOR
Anthony W. Orlando, Highland, N.Y., Ronald R. Jacobsen, Golden, Colo., and Stanwood W. Nutter, Poughkeepsie, and George Popp, Pleasant Valley, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y., a corporation of New York
Filed Sept. 8, 1966, Ser. No. 577,883
7 Claims. (Cl. 242—55.13)



1. A protective cover for a tape reel having flanges comprising an expandable split-ring member adapted to surround the outer circumference of the flanges, toggle means secured to the ends of said split-ring member adapted to draw the ends of said ring member together to clamp the ring member on the circumference of said flanges, tape passage means formed in said ring adjacent one end thereof, movable door means secured to said ring and adapted to be moved into open and closed positions with respect to said passage means, and pneumatic means

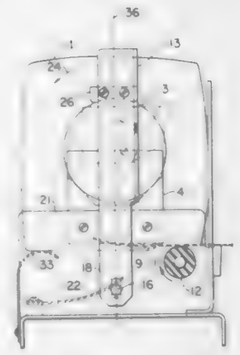
for transporting the end of the tape through said door means in said open position.

3,371,883
TAPE REWIND
Robert C. Hoffman, Park Ridge, and Raymond M. Faber, Chicago, Ill., assignors to Victor Comptometer Corporation, Chicago, Ill., a corporation of Illinois
Filed Jan. 10, 1966, Ser. No. 519,779
11 Claims. (Cl. 242—67.3)



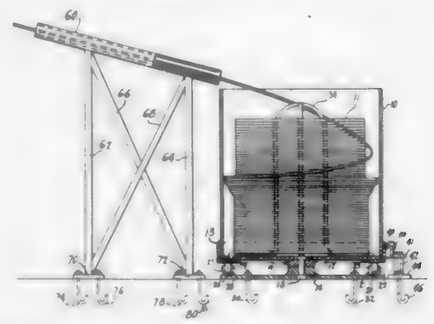
1. A driven tape rewind mechanism for a business machine comprising in combination, a rotatable mandrel on which the tape is wound, means rotatably supporting said mandrel, said mandrel having a first porition on which the tape is wound, said first portion being radially slotted, finger plates movably mounted in said slots to project therefrom so as to be engaged and gripped by the tape being wound on said first mandrel portion, a hollow shaft arranged coaxially with said mandrel and having a camming means in the end thereof adjacent said mandrel, said finger plates having camming surfaces adapted to be engaged with said shaft camming means to project said finger plates outwardly to tape engaging position, said mandrel having a lost motion connection with said hollow shaft to permit axial lost motion therebetween sufficient to engage and disengage said shaft camming means and said camming surfaces, and a means slidably enclosing the adjacent ends of said hollow shaft, said mandrel, and said finger plates.

3,371,884
CASSETTE
Henry N. Fairbanks and Daniel H. Robbins, Rochester, N.Y., assignors to Itek Corporation, Lexington, Mass., a corporation of Delaware
Filed Aug. 4, 1966, Ser. No. 570,209
16 Claims. (Cl. 242—71.1)



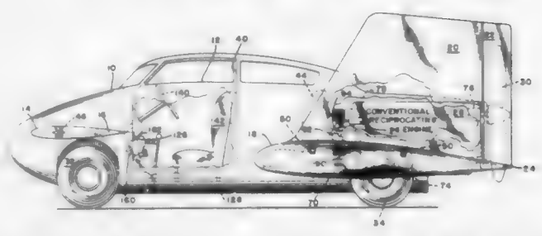
A specially designed "throwaway" cassette is disclosed which is particularly well adapted for storing large amounts of photosensitive web material to be fed into a photocopy machine. The cassette configuration is such that a cassette-mounted roller is not needed and the web driving force remains constant as the material is consumed. A rubber roller external to the cartridge coacts with a bearing surface on the cartridge for driving the strip material from the cartridge.

3,371,885
REINFORCING WIRE DISPENSER
Howard N. Douglas, 20 Circle Drive, Chico, Calif. 95926
Filed May 3, 1966, Ser. No. 547,339
2 Claims. (Cl. 242—129)



A dispenser for heavy stiff reinforcing wire which includes a reel support frame secured for rotation said frame including a substantially cylindrical container, the walls of the cylinder extending substantially above the height of the roll of reinforcing wire therein, and an elongate guide angularly disposed with respect to the axis of the cylinder for directing wire from the interior of the cylinder wall through the director and to the point of use that the stiffness of the wire acts automatically to brake the rotation of the wire support frame is disclosed.

3,371,886
AIRCRAFT ADAPTED FOR HIGHWAY USAGE
Robert O. Schertz, 12 E. 2nd St., El Paso, Ill. 61738
Filed Jan. 14, 1966, Ser. No. 520,732
17 Claims. (Cl. 244—2)

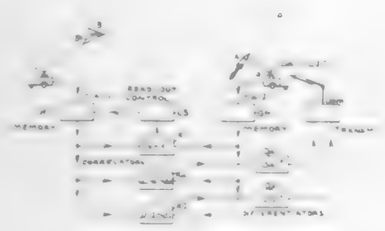


An aircraft adapted for highway travel has a canard configuration; a removable forward horizontal stabilizer; rear foldable main load-carrying wings; a side opening cabin door between horizontal stabilizer and main wings; wheel means used for highway travel, takeoff and landing, and retractible during flight; a power plant used for highway travel and flight, and controls having dual highway and flight usage.

3,371,887
APPARATUS AND METHOD FOR GUIDING A FIRST TRAVELLING BODY RELATIVE TO A SECOND TRAVELLING BODY
Arno Welti, Zurich, Switzerland, assignor to Albiswerk Zurich A.G., Zurich, Switzerland, a corporation of Switzerland
Filed Mar. 23, 1966, Ser. No. 536,833
Claims priority, application Switzerland, Mar. 26, 1965, 4,244/65
11 Claims. (Cl. 244—3.11)

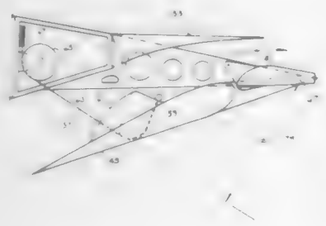
A first tracker tracks a first travelling body to continuously obtain the coordinates of the travel path points of the first body and to provide the coordinates as first path

data. A first memory records the first path data pointwise in accordance with the coordinates thereof. A second tracker separate from the first tracker tracks a second travelling body to continuously obtain the coordinates of the travel path points thereof and to provide such coordinates as second path data. A second memory separate from the first memory records the second path data pointwise in accordance with the coordinates thereof. A



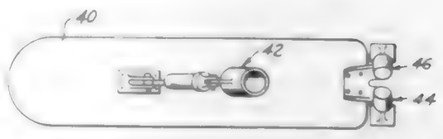
data processor connected to the first and second memories seeks in the path of travel of the second body a point having a predetermined coordinate in a given relation to the same coordinate of a point in the path of travel of the first body and provides guidance commands from other coordinates of the same points in the paths of travel of the first and second bodies. The guidance commands are then transmitted to the first body.

3,371,888
INVERTING FLAP SYSTEM
Alberto Alvarez-Calderon, Av. Salaverry 3465, Orrantia del Mar, Lima, Peru
Filed July 12, 1965, Ser. No. 471,274
25 Claims. (Cl. 244—42)



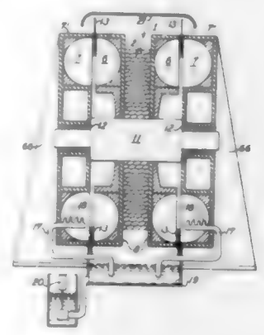
1. A primary airfoil having an upper surface, a trailing edge portion, a trailing edge and a lower surface; an inverting airfoil mounted on said primary airfoil adjacent to said trailing edge, said inverting airfoil being adapted to be inverted by angular motion from a high-speed retracted position faired in said trailing edge portion of said airfoil to an extended position in which said inverting airfoil increases the effective area and chord of said primary airfoil; said primary and inverting airfoils being further characterized in that means are provided to move said inverting airfoil with respect to said primary airfoil comprising bracket means attached to said inverting airfoil with said bracket means having a root portion and a protruding portion, cable means attached to one of said bracket means and inverting flap at a location adjacent to said root portion and extending to said primary airfoil, with said cable means resting against said protruding portion when said flap is in said extended position, and with said cable means extending directly from said location adjacent to said root portion to said primary airfoil in a direction away from the protruding portion of said bracket when said inverting flap is retracted.

3,371,889
STEERABLE LANDING SKID
Donald J. Fecher and Robert A. Price, South Bend, Ind., assignors to The Bendix Corporation, a corporation of Delaware
Filed June 6, 1966, Ser. No. 555,636
4 Claims. (Cl. 244—50)



A steering device for a non-rotatable ground-engaging vehicle skid, such as a landing skid for an aircraft, which includes a movable ground-engaging mechanism for transmitting a positive lateral thrust against the ground to change the direction of movement of the skid with respect to the ground. The desired lateral thrust can be provided by a ground-engaging rotatable wheel, or by a pair of angularly disposed reciprocal ground-engaging pistons or "kickers."

3,371,890
BRAKING DEVICE FOR MOVING BODIES
Jean Merle, La Tronche, France, assignor to Societe Grenobloise d'Etudes et d'Applications Hydrauliques, Grenoble, France, a corporation of France
Filed Oct. 5, 1965, Ser. No. 493,165
Claims priority, application France, Oct. 5, 1964, 4,726; Oct. 23, 1964, 4,735; Mar. 31, 1965, 4,788
27 Claims. (Cl. 244—110)

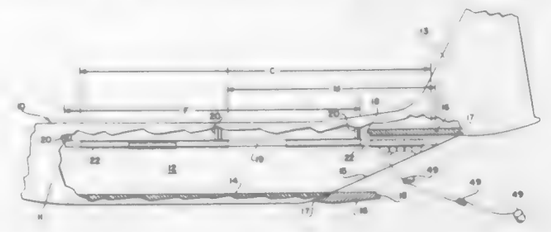


A braking device for decelerating landing aircraft composed of a drum with a landing cable wound thereon and a rotary air brake comprising an associated stator and rotor, each having on a side thereof a plurality of cells with their openings disposed in opposed, spaced relation to the cell openings of the other, and said stator and rotor being in direct communication with the surrounding atmosphere. Means are provided to regulate the flow of the atmospheric air between the stator and rotor. The air brake is preferably cooled by atomization.

3,371,891
LOADING, CONVEYING AND EJECTING MECHANISM FOR AIRCRAFT
Stanley F. Brader, Sr., and Charles L. Kuhn, Marietta, and Oliver F. Snow, Atlanta, Ga., assignors to Lockheed Aircraft Corporation, Los Angeles, Calif.
Filed Sept. 16, 1965, Ser. No. 487,676
10 Claims. (Cl. 244—137)

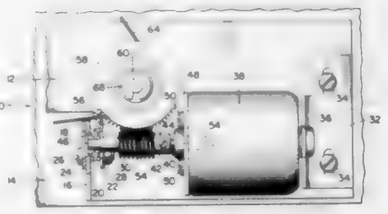
This system provides a structurally sound and stable extensible and retractable aerial delivery conveyor within an aircraft cargo compartment. The entire assembly is mounted in the aircraft overhead structure thereby providing a clear, unobstructed cargo compartment. Means is provided for hoisting and conveying desired bundles

from strategically located storage bins in the cargo compartment of the delivery position beyond the cargo ramp



and automatically release them in sequence at a predetermined time interval without the use of conventional floor rollers or extraction chutes.

3,371,892
MECHANICAL MOUNTING APPARATUS
Ronald C. Miller, Norristown, Pa., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Sept. 12, 1966, Ser. No. 578,573
7 Claims. (Cl. 248—2)



1. A mounting arrangement for a driving member having an output means passing through the longitudinal axis thereof for engaging a load comprising,

mounting means having a mounting portion perpendicular to said longitudinal axis of said driving member,

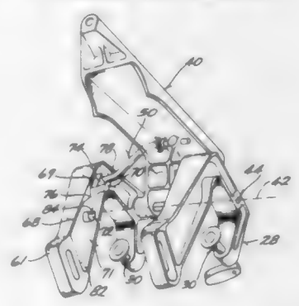
low friction rotational means mounted upon said mounting portion in line with said longitudinal axis of said driving member,

first restraining means for restraining the lateral motion of said driving member while allowing relative motion along said longitudinal axis,

second restraining means for restraining the radial motion of said driving member while allowing relative motion along said longitudinal axis, and

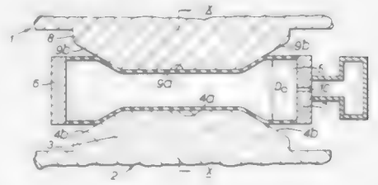
said output means attached to said low frictional rotational means arranged for engaging said load and transferring the forces associated therewith to said low friction rotational means rather than said driving member.

3,371,893
RELEASABLE ARRANGEMENT FOR RETAINING OUTBOARD MOTOR IN ELEVATED POSITION
Clarence E. Blanchard, Jr., Kenosha, Wis., assignor to Outboard Marine Corporation, Waukegan, Ill., a corporation of Delaware
Filed Apr. 8, 1966, Ser. No. 541,158
9 Claims. (Cl. 248—4)



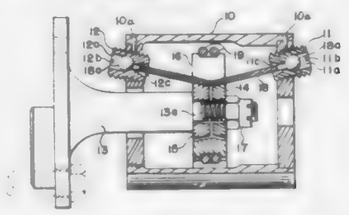
Disclosed herein is means including a support arm mounted on a swivel bracket for pivotal movement relative thereto and engaged in a guideway in a transom bracket for automatically and releasably retaining the swivel bracket in an elevated position in response to swivel bracket pivotal movement.

3,371,894
RESILIENT MOUNTING DEVICES
Michael Carl Hartnell-Beavis, Drymen, Scotland, assignor to Yarrow and Company, Glasgow, Scotland, a British company
Filed Feb. 2, 1966, Ser. No. 524,419
Claims priority, application Great Britain, Feb. 9, 1965, 5,650/65
4 Claims. (Cl. 248—9)



Rotary coupling in which relative rotation between two co-axial members compresses one set of gas filled flexible tubes interposed between concave bearing surfaces on ribs projecting from the two members and allows a second such set to expand. The increase in contact area and pressure of the set of tubes compressed causes the coupling to become stiffer as the displacement from equilibrium increases. The coupling accommodates misalignment of the axes of the two members by rolling of the tubes.

3,371,895
VIBRATION-DAMPING AND LOAD-SUPPORTING APPARATUS
Stephen L. Speranza, Jr., Elmont, N.Y., assignor to Aeroflex Laboratories Incorporated, a corporation of Delaware
Filed Dec. 27, 1965, Ser. No. 516,434
7 Claims. (Cl. 248—20)

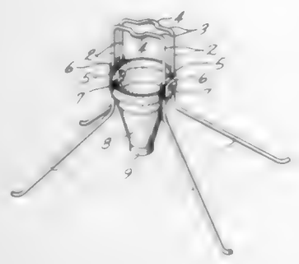


A vibration-damping and load-supporting apparatus for interconnecting a supporting member and a supported member comprises a box-like frame connected to one of the members and having in each of two parallel opposed faces a group of substantially equi-angularly spaced adjustable ferrules for anchoring opposed ends of a group of stranded wire cables extending between the opposed faces. An elongated strut is coaxially located in the frame and includes clamping means for securing an intermediate portion of each of the cables to the strut. The cable lengths, extending in opposite directions from the strut, are oppositely inclined at an acute angle to the axis of the apparatus and are prestressed approximately to the normal static load to be supported.

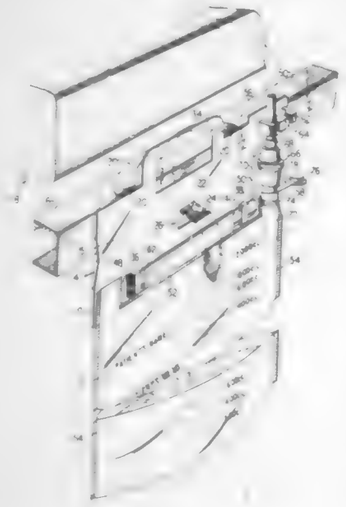
3,371,896
CLAMPING CHRISTMAS TREE STAND
James P. Cox, 17660 SE. Alder, Portland, Oreg. 97223
Filed Nov. 19, 1965, Ser. No. 508,816
1 Claim. (Cl. 248—46)

Crossbars forming the tops of two pivotally connected U-shaped members are pressed toward each other to

clamp a pole, such as a Christmas tree trunk, between them. Each U-shaped member includes an arched portion and legs diverging downwardly away from the arched portion. Pivots connect opposite sides of the arched portions and support a cup between the arched portions to receive the lower end of a pole or trunk. The arched portions are arranged in substantially parallel planes with the legs diverging downwardly away from such planes.



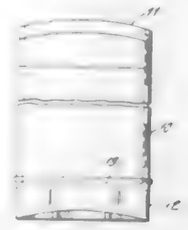
3,371,897
DRAIN BAG SUPPORT ASSEMBLY
Frank J. Serany, Jr., Pompton Plains, and John C. Vasta, Clifton, N.J., assignors to C. R. Bard, Inc., Murray Hill, N.J., a corporation of New York
Filed July 22, 1965, Ser. No. 474,107
8 Claims. (Cl. 248—95)



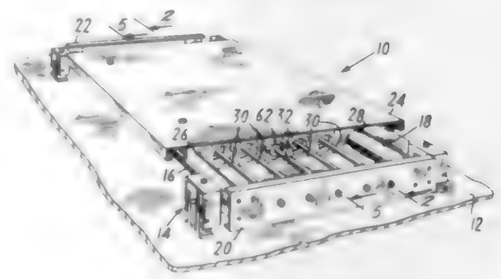
A support for a drainage bag intended to receive body fluids, the support comprising a flexible strap for use in hanging the support from a bed rail or the like and the support having clamping means guiding a drainage tube leading to the bag and means for removably attaching a bag to the support.

3,371,898
GOLF BAG BOTTOM HAVING VENTING OPENINGS
John P. Murray, Jr., Princeton, N.J., assignor to Atlantic Products Corporation, Trenton, N.J., a corporation of New Jersey
Filed June 10, 1966, Ser. No. 556,662
5 Claims. (Cl. 248—96)

A golf bag bottom has a curved bottom with reinforcing ribs extending across the curved bottom. Venting openings are placed in the lowermost point of the curved bottom to drain water from the bag and permit air into the bag. The bottom has a generally rectangular configuration and rectangular walls extending upwardly from the periphery of the bottom.

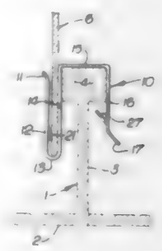


3,371,899
SHOCK ABSORBING APPARATUS
John Algot Johnson, 9 Sheridan Drive, Short Hills, N.J. 07078
Filed Aug. 13, 1965, Ser. No. 479,433
10 Claims. (Cl. 248—119)



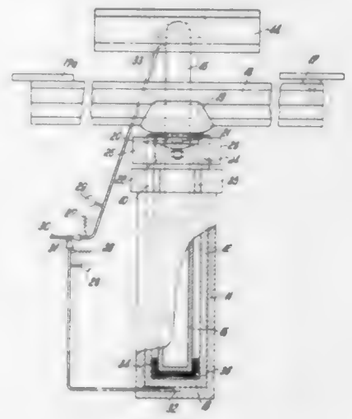
A shock absorbing apparatus including a load-supporting platform slidably mounted on guides carried by vertically extending shock dampening elements for dissipating vertical and laterally directed high frequency shocks, the load-supporting platform being biased by means of pre-stressed springs to an equilibrium position on the guides, the springs being arranged to oppose low frequency shocks tending to displace the platform lengthwise of the guides and including braking means interposed between said platform and said guides which have a low static coefficient of friction which increases as the speed of displacement of the platform relative to the guides increases to thereby dissipate shock and ease restoration of the platform to the equilibrium position on the guides.

3,371,900
UNITARY DOUBLE-DETENT CONNECTOR FOR LIGHTING FIXTURES
Arthur F. Jacobs, Los Angeles, Calif., assignor to Prudential Lighting Corporation, Los Angeles, Calif., a corporation of California
Filed Feb. 14, 1966, Ser. No. 527,264
6 Claims. (Cl. 248—343)



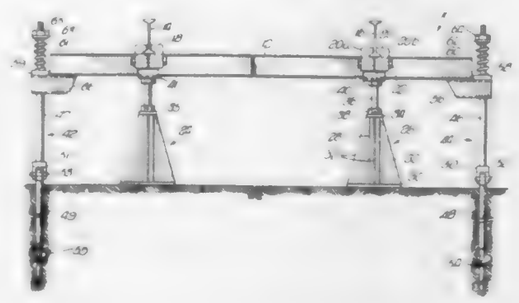
A unitary, double detent connector including an upright U whose outer leg includes a detent angularly inclined toward the base of the U to frictionally grasp an imperforate marginal edge of a lighting fixture at any desired portion of its length, and an inverted U having an inwardly extending detent for receiving and retaining the head of a T-bar of a grid-type ceiling, for removably positioning a lighting fixture on such ceiling.

3,371,901
SUPPORT
Karl M. Groetschel, Stolzestrasse 44, Bochum, Germany
Continuation-in-part of application Ser. No. 322,606, Nov. 12, 1963. This application Aug. 25, 1964, Ser. No. 392,002
Claims priority, application Germany, Aug. 29, 1963, G 38,575; June 29, 1964, G 40,953; Austria, May 14, 1964, A 4,234/64
31 Claims. (Cl. 248—354)



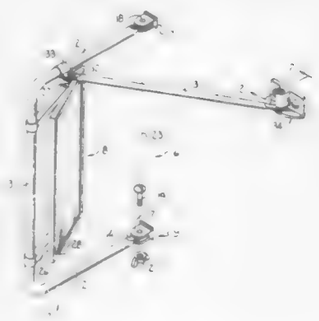
1. A support device for supporting the roof of a mine in underground mining operation and of the type which can be used by itself or as a component of a support assembly, said device comprising, in combination:
an external prop including a cylinder and a hollow piston disposed therein which is open at the top;
an inner prop carried within said hollow piston and being telescopically movable independently of the hollow piston thereby to define a coaxial support, said props being of approximately the same length;
independent cap means provided on each of said props and arranged to be effective upon different regions of the roof of a mine; and
means for placing the props under the same pressure by a pressure medium and in a sequence which is selectable.

3,371,902
MOBILE HOUSE STABILIZER
George J. Hartwick, Box 758, Rte. 1, Waukegan, Ill. 60085
Filed July 26, 1966, Ser. No. 567,885
6 Claims. (Cl. 248—354)



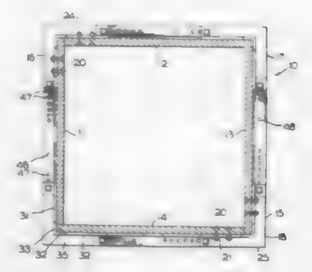
1. A stabilizer system for a mobile house or similar vehicle, comprising a main beam member for supporting the chassis of said mobile house, means for clamping the chassis members of said mobile house to said main beam member, said means for clamping being slideably mounted upon said main beam member and moveable along the length thereof for registry with said chassis members, supporting means for maintaining said main beam member above ground level in a substantially horizontal attitude, and a pair of tension members, one of said tension members being positioned at each end of said main beam member outboard of said supporting means, and each of said tension members being secured at one end to the ground and having at its other end resilient means for exerting a groundward force upon the end of said main beam member.

3,371,903
BRACE ROD FOR REARVIEW MIRRORS
Maurice J. Thompson, 1632 E. 14th St., Oakland, Calif. 94606
Filed Aug. 17, 1966, Ser. No. 572,973
7 Claims. (Cl. 248—486)



1. A bracing device of the character described for use with a mirror supporting bracket pivotally attached to a vehicle, comprising an axially extending rod, a housing adapted to be secured to a vehicle, means in said housing for receiving one end portion of said rod and pivotally supporting the same, means on the other end portion of said rod for pivotal connection to said bracket, means resiliently retaining said rod in said housing and permitting withdrawal of the same upon a predetermined force applied to the rod by pivotal movement of said bracket.

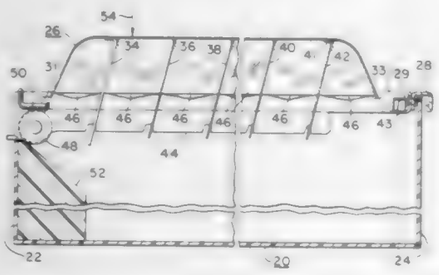
3,371,904
FORM FOR CONCRETE COLUMNS
John L. Low III, P.O. Box 1348, Laurel, Miss. 39440
Filed Oct. 23, 1965, Ser. No. 503,858
8 Claims. (Cl. 249—48)



1. A form for pouring a concrete column comprising four upwardly extending substantially flat panels, the panels being arranged whereby they enclose an upwardly extending four sided cavity for receiving unset concrete

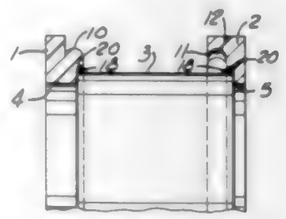
mix with adjacent panels being at approximately right angles to each other to thereby provide four substantially 90° corners at the edges thereof, first and second column clamps, one of the clamps being retained on the outer surface of a first of said corners and the other being retained on the outer surface of a second of said corners, the first and second corners being oppositely disposed, each of the clamps including a pair of elongated, substantially flat transversely extending portions, the transversely extending portions being substantially shorter than the width of the panels and lying in upright intersecting planes which form an approximately 90° internal angle at the intersection, the internal surfaces of the transversely extending portions conforming with and being positioned on the outer surfaces of the said oppositely disposed corners whereby one horizontally extending portion is on an edge portion of each of the four panels, means for securely attaching hte horizontally extending portions to the panels whereby the panels forming the first and second corners are retained at right angles to each other and the first and second corners are maintained substantially square, a pair of spaced substantially flat reinforcing portions extending outwardly from the external surfaces of the pair of horizontally extending portions of each clamp, the pair of spaced reinforcing portions extending longitudinally along and embracing the pair of horizontally extending portions and forming an approximately 90° angle therewith, the spaced reinforcing portions having aligned openings therein alongside each of the horizontally extending portions, means for retaining the edges of the panels forming the third and fourth corners at right angles to each other and thereby maintaining the third and fourth corners substantially square, and means for connecting the retaining means for the edges of the panels forming the third and fourth corners to each of the column clamps, the connecting means including elongated members which are inserted between the spaced reinforcing members, the said elongated members having openings therein aligned with the openings in the spaced reinforcing members, and fastening means inserted through the aligned openings in the spaced reinforcing members and the openings in the said elongated members.

3,371,905
ICE EJECTOR TRAY AND BUCKET
Roland J. Bunnell, Durham, N.C., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 6, 1965, Ser. No. 511,904
7 Claims. (Cl. 249—69)



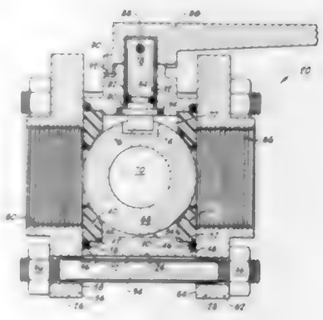
1. A frozen liquid ejecting assembly including a long mold for frozen liquid and a long collecting receptacle for receiving in inverted position said mold, said collecting receptacle and inverted mold having interengaging means adjacent one end for supporting said end of said mold upon said receptacle, the opposite end of said collecting receptacle being constructed to extend outside the path of any downward movement of said mold, said mold being provided with a movable grid, and interengaging cam and cam follower means between said mold and said receptacle for moving said movable grid to release frozen liquid from said mold for delivery into said receptacle.

3,371,906
IRIS VALVE
Richard P. Lubold, Indiana, Pa., assignor to Link-Belt Company, a corporation of Illinois
Filed Jan. 14, 1965, Ser. No. 425,391
10 Claims. (Cl. 251—4)



An iris valve having a flexible sleeve connected at spaced annular positions therealong to the bores of a plurality of rings at least one of which may be mounted on a tubular member and the other having relative rotary movement to twist the sleeve and close the bores of the rings. Adjacent faces of the rings having concave and convex bearing sockets disposed axially of the rings which when flexed are snapped into and out of mating interengagement. The aligned annular surfaces on the bores of the rings are spaced axially of said bearing surfaces to which said sleeve positions are secured. Thus the bearing surfaces are wholly contained within the rings themselves and one or the assembly of the rings may be detachably secured to a tubular member through which material is to pass and which is valved by the iris sleeve. The flexing of a ring will disengage the bearing surfaces of the rings for quick repair or replacement and the sleeve may be made integral with the rings and of the same material thus protecting the bearing surfaces.

3,371,907
FLEXIBLE BALL VALVE SEALS
Domer Scaramucci, 3245 S. Hattie, Oklahoma City, Okla. 73129
Filed Sept. 27, 1965, Ser. No. 490,354
16 Claims. (Cl. 251—175)

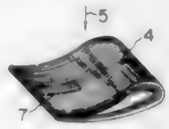


A ball valve having an annular seal in the downstream end of the valve chamber formed of an elastomer. The inner diameter of the seal is less than the diameter of the valve outlet, and the seal is anchored at its outer periphery in the valve chamber, whereby the seal is deflected into the outlet as the valve ball moves downstream to minimize the degree of contact between the valve ball and seal and minimize the force required to open and close the valve.

3,371,908
TURBINE BLADING COMPONENTS AND PROCESS OF PRODUCING THE SAME

Satoru Mito and Hiroshi Yoshida, Yokohama-shi, Satoshi Ote, Tokyo-to, and Kazumi Shimotori, Kawasaki-shi, Japan, assignors to Tokyo Shibaura Denki Kabushiki Kaisha, Kanagawa-ken, Japan, a joint-stock company of Japan

Filed Nov. 1, 1966, Ser. No. 591,330
Claims priority, application Japan, Nov. 2, 1965, 40/66,922
3 Claims. (Cl. 253—77)

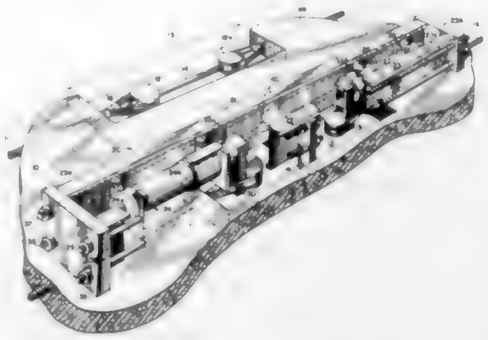


A turbine blade for use in a turbine having a fibrous crystalline structure on all of the working surfaces of its body sections no less than a fiberization of 10 and existing along an entire longitudinal axis of the blade. The fiberization is oriented in a direction, on the body of the blade, substantially parallel to a direction of flow of the operating or working fluid relative to the blade.

3,371,909
HYDRAULIC APPARATUS FOR APPLYING TENSION TO CABLES

Frederick M. Stinton, Glen Ellyn, Ill., assignor, by mesne assignments, to F. M. Stinton, Inc., Hinsdale, Ill., a corporation of Illinois

Filed Nov. 23, 1966, Ser. No. 596,579
10 Claims. (Cl. 254—29)



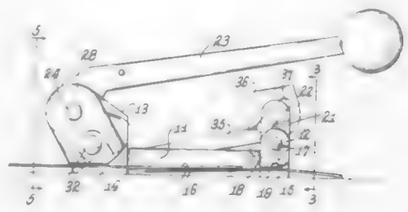
First and second hydraulic jacks are mounted within a rigid, unitary frame for applying a prestressing force to collinear cables embedded in concrete and extending into a common, central pocket in the concrete. Each of the jacks has a fixed component attached to the frame and a movable component adapted for opposing motion longitudinally of the cables that are to be tensioned. Each of the movable components is provided with means for engaging and holding its associated cable; and when the jacks are expanded, the movable components are forced in opposing motion thereby pulling the cables together and applying tension to each cable.

3,371,910
STRAP STRETCHING TOOL

Nicholas L. Johnen, 10664 Wakefield, Westchester, Ill. 60153

Filed Mar. 23, 1967, Ser. No. 625,551
10 Claims. (Cl. 254—79)

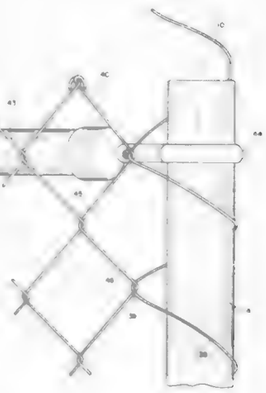
A strap stretching tool having a spaced pair of strap gripping elements operably connected to each other so as to be movable jointly or independently for releasing and gripping related ends of a strap and a hand operated lever to actuate one of the strap gripping elements to draw the strap taut about an object preliminary to final securement.



3,371,911
CHAIN LINK FABRIC FASTENER

Rudolph Edgar Parisien, Box 807, Montreal Road, R.R. 1, Ottawa, Ontario, Canada

Filed Apr. 4, 1966, Ser. No. 539,905
Claims priority, application Canada, Mar. 15, 1966, 954,746
2 Claims. (Cl. 256—47)

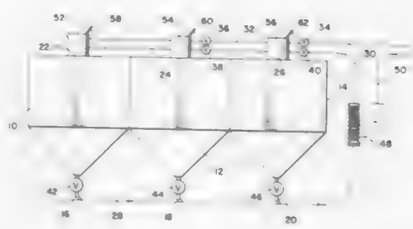


A fastener for securing chain link fence to a supporting post, the fastener being in the form of a helix, each coil of which has an extended portion to engage the mesh of the chain link fence. The fastener is inserted over the upper end of the post in the manner of a cork-screw while a free lower end is guided through successive adjacent meshes of the chain link fence.

3,371,912
RECIRCULATING PARTICULATE SOLIDS BLENDER

Lee F. Samler, Baltimore, and Evan V. Briggs, Millersville, Md., assignors to National Plastic Products Company, Inc., Odenton, Md., a corporation of Maryland

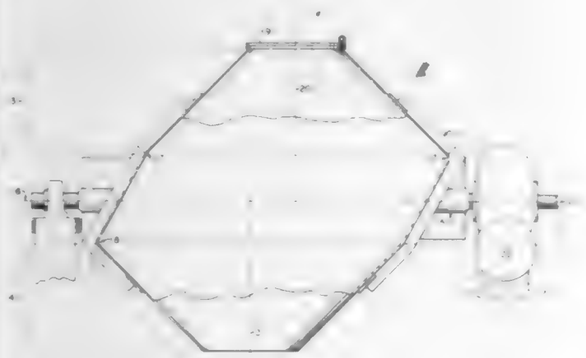
Filed Jan. 5, 1967, Ser. No. 607,542
7 Claims. (Cl. 259—4)



The present disclosure relates to a recirculating blender for particulate solids and, more particularly, to a system for the blending of particulate solids which has large capacity and versatility and is particularly useful in the

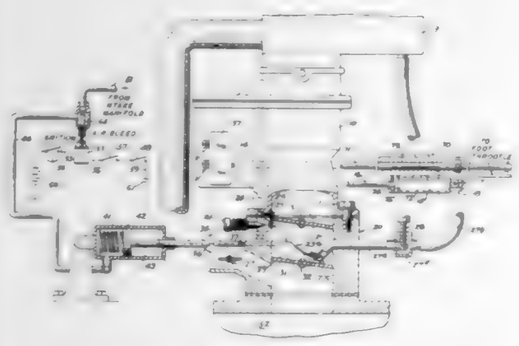
blending of plastic materials and additives, such as pigments, pigmented pellets, stabilizer and/or plasticizer concentrates. A blender having compartments in parallel is provided having recirculating conveying means so that solid particles can be recirculated from the bottom of all the compartments simultaneously to the top of one of the compartments along with fresh feed for a given period of time, and then shifted to the top of another compartment to provide sequential feeding to each compartment while there is provided simultaneous discharge from all compartments.

3,371,913
MIXER
John L. Muench, Sr., 8 Chestnut Place, Short Hills, N.J. 07078
Filed Feb. 14, 1967, Ser. No. 615,981
6 Claims. (Cl. 259—81)



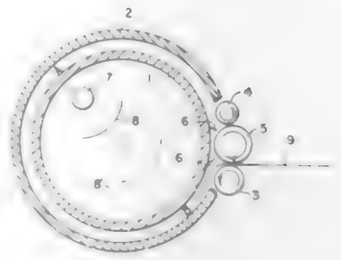
A mixer having a generally tubular middle section of its mixing chamber in non-perpendicular intersection with the horizontal axis of rotation of the mixing chamber.

3,371,914
FUEL FEED SYSTEM
Brooks Walker, 1280 Columbus Ave., San Francisco, Calif. 94133
Filed Mar. 20, 1967, Ser. No. 624,636
12 Claims. (Cl. 261—41)



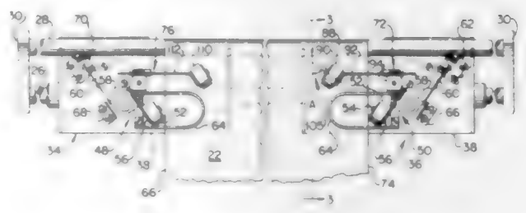
A carburetor having means for introducing a stream of rich fuel and air mixture and a stream of air into the induction conduit on the downstream side of the throttle valve, and means for mixing said streams below said valve and away from the wall of said conduit. A second valve is also provided downstream of said throttle valve and mixing means along with means to close said second valve and open an auxiliary air inlet valve during high speed decelerations.

3,371,915
TREATMENT MACHINE FOR HEAT TREATMENT OF SENSITIVE MATERIAL
Michio Kawamura and Katsuhisa Ueda, Tokyo, and Yoshizo Ikegami and Kuniomi Abe, Hyogo, Japan, assignors to Fuji Shashin Film Kabushiki Kaisha, Kanagawa, Japan, a corporation of Japan
Filed Aug. 12, 1966, Ser. No. 572,088
Claims priority, application Japan, Aug. 13, 1965, 40/49,111
1 Claim. (Cl. 263—6)



A heater for light sensitive material to be heat treated, having a nonrotatable drum. The surface of the drum is provided with an uneven temperature distribution by means of a heat source and a mirror within the drum.

3,371,916
AUTOMATIC TRACKING CONTROL APPARATUS FOR MAINTAINING ALIGNMENT OF A MOVING WEB
Walter J. Jaeger and Chester G. Jones, Kettering, Ohio, assignors to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
Filed Sept. 3, 1965, Ser. No. 484,815
4 Claims. (Cl. 226—17)

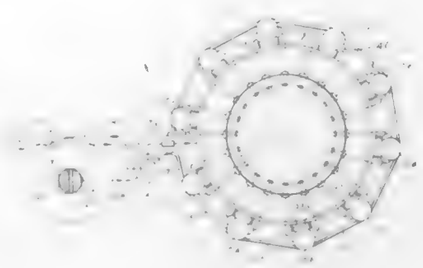


An automatic tracking control apparatus for maintaining alignment of a moving web which utilizes correction rollers having axes of rotation positioned at an acute angle relative to the intended direction of travel of the web, so as to shift the web laterally to restore it to the intended direction of travel. The apparatus also includes sensing rollers having axes of rotation positioned at an acute angle relative to the intended line of direction so as to detect lateral shifts in the web and to actuate the appropriate correction roller.

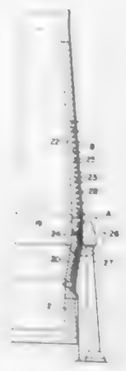
3,371,917
APPARATUS FOR FEEDING FUEL INTO A BLAST FURNACE
Lauritz E. Mylting, Ardmore, Pa., assignor to Buell Engineering Company, Inc., Lebanon, Pa., a corporation of Delaware
Continuation-in-part of application Ser. No. 471,765, June 4, 1965. This application Oct. 21, 1965, Ser. No. 499,744
28 Claims. (Cl. 266—29)

1. Apparatus for feeding solid fuel into a blast furnace comprising means including feed pipes entering each of the tuyeres for continuously discharging gas streams under

pressure into the furnace through the tuyeres, means for varying the pressure of the gas stream in the feed pipe to each tuyere in accordance with the pressure in the furnace adjacent to that tuyere to maintain a substantially constant rate of gas flow through the feed pipes into the several tuyeres, and means for introducing solid fuel into the gas stream through each feed pipe at an individually controlled rate of introduction for each tuyere.



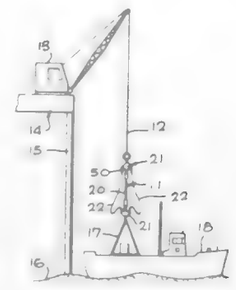
3,371,918
BLAST FURNACE CONSTRUCTION
Kumao Ueshima, Takayuki Imaida, and Hiroshi Nakasono, Kitakyushu, Japan assignors to Yawata Iron & Steel Co., Ltd., Tokyo, Japan
Filed May 14, 1965, Ser. No. 455,526
Claims priority, application Japan, May 20, 1964, 39/28,073
4 Claims. (Cl. 266—43)



A blast furnace having a single continuous shell, a brick wall of uniform thickness above the tuyere and positioned within the shell, the brick wall being divided at the belly of the furnace into an upper and lower brick wall, a ring of plates on the inside of the shell at the line of division and supporting the load of the brick wall above the ring of plates, a plurality of supporting members fixed to the external surface of the shell at the belly along the periphery of the shell, and supporting means supporting said members.

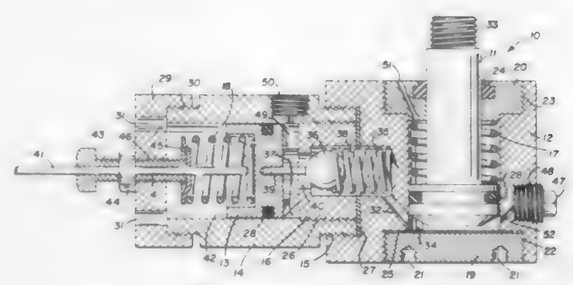
3,371,919
LOAD ABSORBING SNUBBING DEVICE
Burt S. Minor, La Habra, Calif., and James Newton, Lafayette, La., assignors to Bettis Rubber Company, Whittier, Calif., a corporation of California
Filed Nov. 24, 1965, Ser. No. 509,500
6 Claims. (Cl. 267—73)

The application discloses a load absorber device having a pair of hanger assemblies adapted to be connected in a line or cable, a plurality of elongated elastic tension members connected between the hanger assemblies and



flexible snubber members connected between the hanger assemblies.

3,371,920
WORKPIECE ENGAGING AND SUPPORTING DEVICE
Richard J. Shea, Spring Valley, Calif., assignor to Rohr Corporation, Chula Vista, Calif., a corporation of California
Filed June 10, 1965, Ser. No. 462,830
1 Claim. (Cl. 269—23)

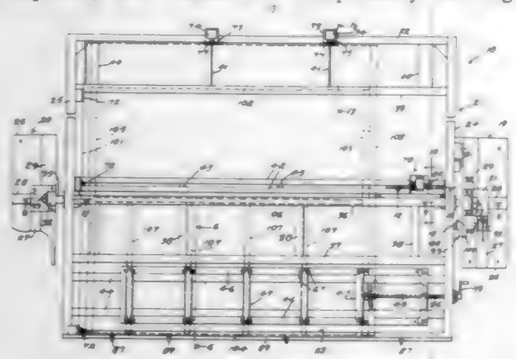


A workpiece support responds to hydraulic pressure sufficient to cause the same to move and engage the workpiece but insufficient to lift it. Once engaged, the hydraulic pressure is permitted to build up in accordance with a predetermined loading of the workpiece on the support. This pressure buildup closes a valve for preventing release of the hydraulic fluid which then becomes the means of support for the workpiece. If the workpiece is displaced away from a previous position, the hydraulic fluid displaces the workpiece support correspondingly to provide continuous engagement with the workpiece. When the workpiece is removed, the valve is released draining the entrapped fluid and permitting removal of the support device from the workpiece.

3,371,921
MACHINE FOR ASSEMBLING WINDOW AND DOOR FRAMES
Frank A. Hollomon, Silver Spring, Md., and Kenneth H. Pizer, Morton, Pa., assignors, by mesne assignments, to Hydro-Air Engineering, Inc., St. Louis, Mo., a corporation of Missouri
Filed Oct. 22, 1965, Ser. No. 501,266
8 Claims. (Cl. 269—25)

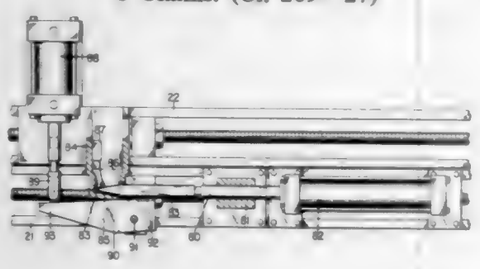
1. A frame assemblying machine comprising a table top of open work construction adapted to support elements constituting the parts of a window or door frame including cripples, adjustable cripple locator means mounted in and forming a part of said table top for supporting the cripples and including a plurality of aligned pairs

of upright locator elements between which the cripples are disposed, and means for reciprocally moving said



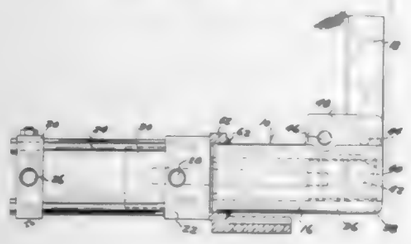
cripple locator means relative to the table top for varying the positions of said locator elements and the cripples engaged thereby relative to the table top.

3,371,922
ADJUSTABLE CLAMP MECHANISM FOR MOLDING FRAMEWORK
Jose R. Puente, Rochester, N.Y., assignor to Leaming Plastics, Inc., Canandaigua, N.Y.
Original application Feb. 5, 1965, Ser. No. 430,638, now Patent No. 3,287,765, dated Nov. 29, 1966. Divided and this application June 30, 1966, Ser. No. 561,913
6 Claims. (Cl. 269—27)



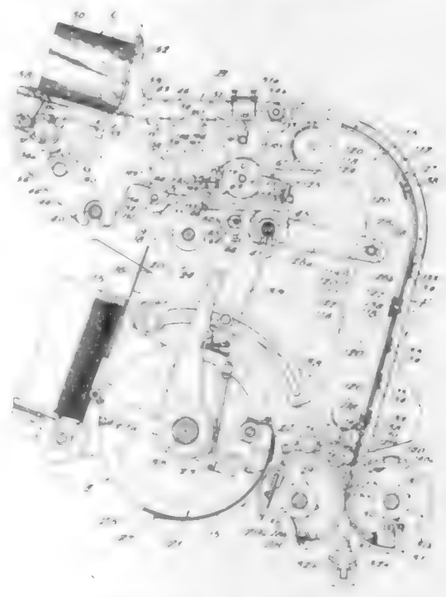
A latching mechanism for closing two elements from an ajar position uses a movable latch bar on one element, a latch receiver on the other element, a lever mounted on the latch receiving element, and a powered lever arranged on one of the elements for levering against the latch to force the elements closed. The latch and its receiver are surfaced to cam the elements together as the latch is slid home, and the latch and lever are powered pneumatically. The arrangement is useful in closing normally ajar frames for holding sheets of material for molding operations.

3,371,923
MOUNT FOR CYLINDER OPERATED POWER CLAMP
Leland F. Blatt, Grosse Pointe Woods, Mich. (24121 Mound Road, Warren, Mich. 48091)
Filed Aug. 17, 1965, Ser. No. 480,372
4 Claims. (Cl. 269—32)



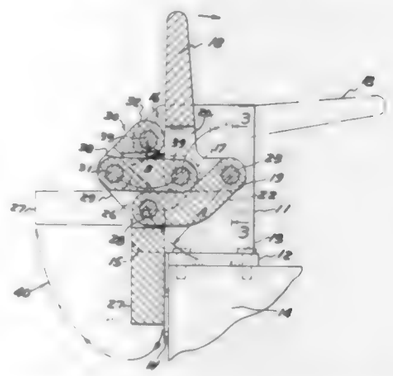
A cylinder operated power clamp system and a mounting means therefor, the system including aligned first and second cylinders with their respective pistons interconnected, and a clamp actuated by said pistons; a mounting means including a base leg and an upright mounting leg, the latter having a bore receiving and supporting one cylinder, and a plurality of threaded holes to receive tie rods to secure the other cylinder thereto; said cylinders adapted for independent angular adjustment relative to said mounting leg.

3,371,924
APPARATUS FOR TIPPING INSERTS INTO A SADDLE STITCHED BOOK
Earle A. Nelson, Park Forest, and Louis Kostal, Lombard, Ill., assignors to R. R. Donnelley & Sons Company, a corporation of Delaware
Filed Mar. 7, 1966, Ser. No. 532,334
10 Claims. (Cl. 270—53)



Insert tipping apparatus for a signature feeding station of the type wherein a signature is opened by cooperating feed rollers and dropped on the saddle. A glue carrying insert is timely fed into the rollers in association with the signature, whereby the rollers press the insert onto the signature.

3,371,925
TOGGLE CLAMP WITH UNUSUAL RISING ACTION
Leland F. Blatt and Paul R. Williams, Grosse Pointe Woods, Mich., assignors to I. S. I. Manufacturing, Inc., Warren, Mich.
Filed Aug. 4, 1965, Ser. No. 477,271
4 Claims. (Cl. 269—91)



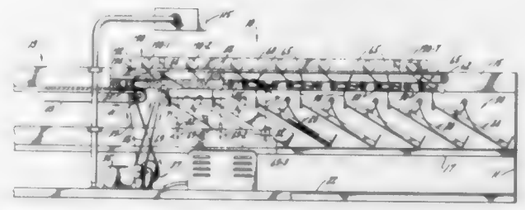
A toggle clamp with handle on a first pivot and work securing arm, with spaced portions thereof, each pivotally mounted through separately located pivotal links connected to pivot through different arcs, to constrain pivotal

movements of said arm to a resultant path in a relatively confined area, and with a third link interconnecting said arm and handle for effecting opening and closing movements of said arm on opening and closing movements of said handle.

ERRATUM

For Class 270—53 see:
Patent No. 3,371,924

3,371,926
DOCUMENT SORTING AND DISTRIBUTING SORTER APPARATUS
Eugene A. Anderson, 414 W. Taylor Road, Lombard, Ill., 60148, and Alfred Anderson, 460 S. York St., Elmhurst, Ill. 60126
Filed Oct. 24, 1965, Ser. No. 504,552
7 Claims. (Cl. 271—52)



1. Apparatus for receiving, automatically sorting and depositing documents directly from a source comprising, in combination, a receiving platform adapted to align documents placed thereon in a single file and feed the so aligned documents for sorting and depositing; an elongated sorting and depositing deck adjacent said receiving platform so as to receive documents therefrom, said deck having a plurality of normally closed gates, each defining the entrance to a bin for segregating documents, means for automatically opening a particular gate to receive a predetermined number of documents, means disposed near the entrance to each bin and connected with each said gate for counting documents passed therethrough and for closing said gate when the proper number of documents have so passed, and means for moving said documents in a single file along said deck to an open gate.

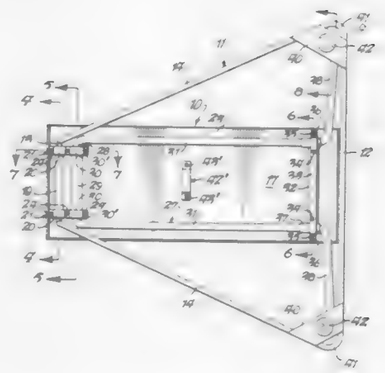
ERRATUM

For Class 271—74 see:
Patent No. 3,371,929

3,371,927
JUMPING DEVICE TOY
John W. Ryan, Bel Air, and Warren Dale Kabot, Manhattan Beach, Calif., assignors to Mattel, Inc., Hawthorne, Calif., a corporation of California
Filed Aug. 25, 1965, Ser. No. 482,561
5 Claims. (Cl. 272—57)

A jumping device having an upright staff provided with stirrups or steps on which a rider can stand while grasping the upper end of the staff, and a lower ground engaging end. Ground engaging leg means, having laterally spaced ground engaging portions, are pivoted to the staff and a block of rubber-like material is secured to the leg means and the staff, to be distorted in shear upon relative pivotal movement between leg means and staff, to yieldably bias the former to a predetermined position.

3,371,928
SPRINGBOARD
Charles W. Buddo, 2 Blythdale Road, Toronto, Ontario, Canada
Filed Nov. 4, 1963, Ser. No. 321,011
3 Claims. (Cl. 272—66)

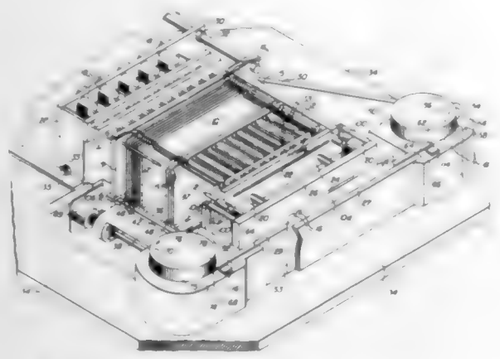


3. A free standing springboard comprising a unitary rod-like frame having first and second ends connected by connecting leg portions, an elongated platform having opposite sides and first and second ends with said second end of said platform being located proximate said second end of said frame and with said opposite sides lying inwardly of said connecting leg portions of said frame, means connecting said first end of said platform to said first end of said frame for pivotal movement thereabout with said first end of said frame and said first end of said platform being substantially coextensive, elongated spring means connected to the undersurface of said platform and having downwardly inclined laterally extending leg portions with outer ends extending outwardly beyond said opposite sides of said platform toward said connecting leg portions at said second end of said platform with said second end of said frame extending laterally outwardly beyond said sides of said platform at said second end thereof, and plate means secured to said frame proximate the junction of said second end and said connecting leg portions for slidingly supporting said outer ends of said elongated spring means.

3,371,929
RECORD PROCESSING APPARATUS
Michael S. Shebanow, Medfield, Mass., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed July 13, 1965, Ser. No. 471,579
18 Claims. (Cl. 271—74)

Apparatus for returning selected record cards to their normal, randomly accessible storage location, suspended above a reference plane. The mechanism includes a plate having a plurality of holes through which vacuum pressure is applied. A selected card travels in edgewise contact with the reference plane and covers up successive holes of the plate as it arrives at the latter. The applied vacuum pressure is effective to arrest the card at a predetermined point on the plate. The plate is capable of lifting the card

in a direction substantially normal to the direction of the card travel, to a position where an aperture in the plate comes into registry with card removal means. The latter



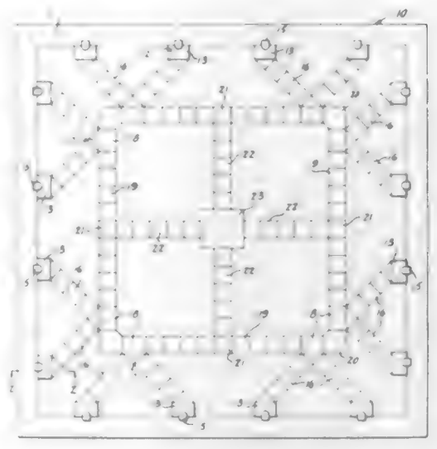
is operative from the rear of the plate to return the card to its storage location in a direction substantially normal to both the direction of card travel and the direction of card lift.

3,371,930
EXTENSIBLE NIGHT STICK
Yoshio Shiga, 128 2-chome, Nakamachi Nerima-ku, Tokyo-to, Japan
Filed Oct. 6, 1965, Ser. No. 493,325
1 Claim. (Cl. 273—84)

The present invention relates to a night stick, and more particularly to an extensible night stick convenient for a policeman to carry and use for self-defense.

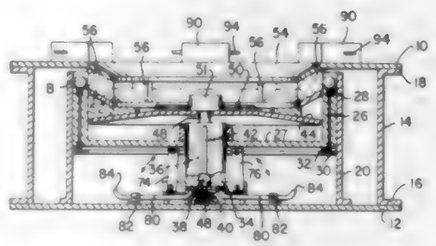
3,371,931
GAME BOARD HAVING PLURAL PATHS AND TOKEN-RECEIVING POCKETS
Robert Carlton Saunders, Rte. 7, Box 519, Roanoke, Va. 24015
Filed May 17, 1965, Ser. No. 456,203
4 Claims. (Cl. 273—134)

A game board bounded by a plurality of side edges and having a playing surface including indicia defining paths over which playing pieces are moved, and wherein pockets are formed in the board, the pockets having ends opening into the playing surface and being adapted to selectively receive a token game piece therein; each pocket being positioned intermediate an edge of the board and a terminal end of selected ones of the paths, and each pocket having a hinged closure member extending across its open end and being secured to the board, the closure members be-



ing movable to conceal or expose a token disposed in its associated pocket.

3,371,932
RANDOM MIXING AND DISPENSING AMUSEMENT DEVICE
Edmund J. Kranz, 1426 Buckingham, Toledo, Ohio 43607
Filed Mar. 17, 1965, Ser. No. 440,360
6 Claims. (Cl. 273—144)

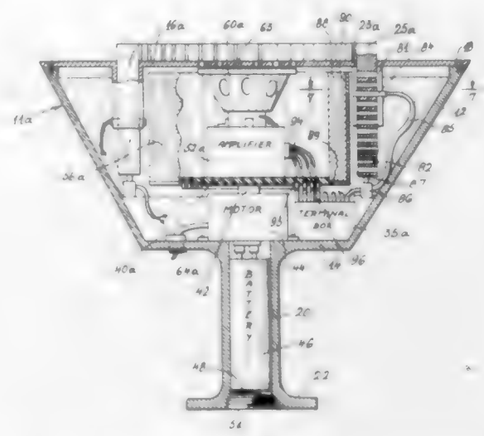


An amusement device having a plurality of spherical playing pieces supported on an annular supporting member and a plurality of sets of playing piece propelling means for forcing selective ones of the playing pieces off of the supporting member to a visible position. Typically, the playing pieces are provided with indicia of a conventional deck of playing cards.

3,371,933
SOUND PRODUCING DEVICE
Dorothea M. Weitzner, 8 E. 62nd St., New York, N.Y. 10021
Filed Oct. 19, 1965, Ser. No. 497,776
3 Claims. (Cl. 274—1)

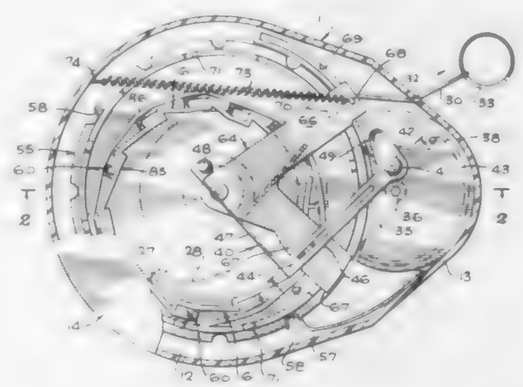
The disclosure describes a sound producing device in the form of a compact unit which can be stood on a table. Inside a casing is a rotatable drum carrying magnetic tracks around its periphery. Elongated push-buttons exposed at the top of the casing are movable inside the casing to close switches connected in circuit with mag-

netic pick-up heads carried by the push-buttons in selected bores spaced longitudinally of the push-buttons. A loud-



speaker inside the drum projects sound upwardly through the apertured top of the casing.

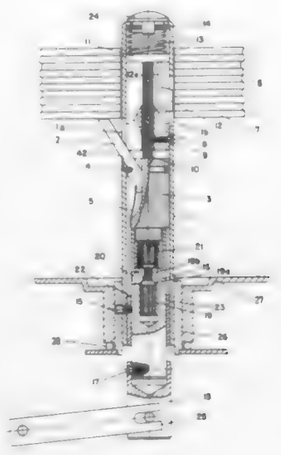
3,371,934
PHONOGRAPH DEVICE
Golda A. Duncan, North Hollywood, and Robert N. Aleson, Sylmar, Calif., assignors, by direct and mesne assignments, to Lorraine Industries, Inc., Bridgeport, Conn.
Filed Feb. 28, 1966, Ser. No. 530,588
13 Claims. (Cl. 274—1)



The application discloses means in a mechanical phonograph device for playing sections of a phonograph record in predetermined sequence upon successive operations of the device. The means includes an apertured control disk over the record through which the needle extends, a means for advancing the disk each time the device is operated, and a means for limiting each operating cycle.

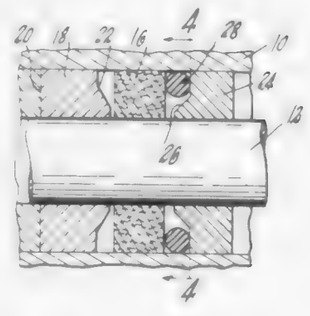
3,371,935
STACKING ARBOR FOR AUTOMATIC RECORD CHANGERS
Richard Kieninger, St. Georgen, Black Forest, Germany, assignor to Perpetuum-Ebner Fabrik fuer Feinmechanik und Elektrotechnik Steidinger & Co. Kom. Ges., St. Georgen, Black Forest, Germany
Filed Oct. 18, 1966, Ser. No. 587,483
Claims priority, application Germany, Oct. 21, 1965, P 37,928
10 Claims. (Cl. 274—10)

A stacking arbor for an automatic record changer having clamping and supporting members movable radially and vertically relative to each other which are operated by control means located in the stacking arbor and movable between two end positions by the control mechanism of the record changer, and locking means which in the absence of any record on the stacking arbor are moved



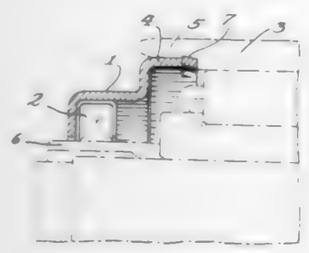
to a locking position in which the control means are locked in one of the end positions thereof to initiate stopping of the record changer.

3,371,936
HIGH PRESSURE PACKING
Alfred J. Beaudette, Wrentham, Mass., assignor to Harwood Engineering Co., Walpole, Mass., a corporation of Massachusetts
Filed Mar. 31, 1965, Ser. No. 444,146
2 Claims. (Cl. 277—117)



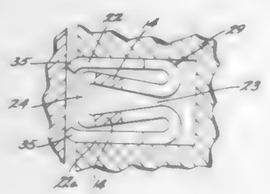
The disclosure of the invention comprises a packing for a high pressure cylinder unit interposed between the cylinder and piston walls including an annular leather packing, ring type headers of a hard non-yielding material having leather packing confining faces supporting each of the downstream and upstream sides of said leather packing, each said header having the leather packing confining face thereof extending between the cylinder and piston walls sloped inwardly toward the opposing header, said leather packing being conformed to provide a relatively short section of said leather packing engaging said piston peripheral surface and a substantially longer external surface engaging the internal peripheral surface of said cylinder, and an O-ring confined between the upstream face of said leather packing, the outer portion only of the leather packing confining face of the adjacent header and said internal peripheral surface of said cylinder, spring means interposed between said cylinder and piston walls at the upstream side of said packing for maintaining an initial pressure against said upstream header, O-ring, and leather packing, and shoulders on the internal surface of said cylinder engaging respectively the downstream header and said spring at the upstream side of the packing confining the packing assembly therebetween.

3,371,937
SEALING DEVICE FOR BEARINGS
Osamu Maeda, Nishiku, Osaka, Japan, assignor to Toyo Bearing Manufacturing Company Limited
Filed June 7, 1965, Ser. No. 461,899
Claims priority, application Japan, Mar. 20, 1965, 40/16,394
4 Claims. (Cl. 277—189)



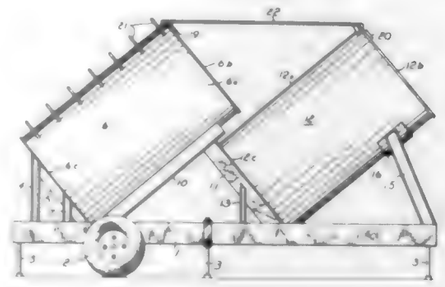
A bearing assembly for a railway car truck is shown with an outer race having a counterbore provided with an endless groove to releasably receive a seal casing having a cylindrical section for interference fit within the counterbore. The seal casing has a set of integral tongue portions in partly severed relation thereon and projecting in outwardly inclined relation at circumferentially spaced locations to confront endwise against the shoulder for resisting axial extraction of the seal casing from the outer race, the tongues being resiliently inwardly deflectable in response to an axial retraction force that is determined by the amount of projection of the tongues. In another embodiment, a second set of integral tongues are provided in alternating axially spaced relation to the first set and of lesser projection to provide the aforementioned interference fit with the counterbore.

3,371,938
PISTON RINGS
Douglas W. Hamm and Kenneth J. Nisper, Muskegon, Mich., assignors to Muskegon Piston Ring Company, Muskegon, Mich., a corporation of Michigan
Continuation-in-part of application Ser. No. 426,573, Jan. 19, 1965. This application Aug. 16, 1965, Ser. No. 482,028
8 Claims. (Cl. 277—200)



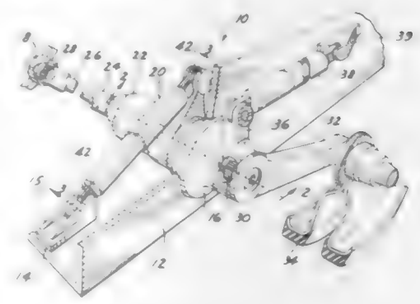
A one-piece piston ring having sides consisting of a plurality of independent segments joined to each other only through the central body portion of the ring. The central body portion consists of struts, each of which has a pair of straps integral with a different segment. The struts are bent into an outwardly extending loop projecting generally to the outer face of the ring with the sides of the loop generally parallel to the plane of the segments. The two straps forming each strut are joined by a circumferentially extending tie bar which is arranged with the greater of its cross-sectional dimensions lying in the plane of the sides of the loop. The preceding description is not to be construed as a limitation upon the scope of the invention.

3,371,939
MOBILE BULK MATERIAL HANDLER
August G. Welk, Spokane, Wash., assignor to Welk Brothers Metal Products, Inc., Spokane, Wash., a corporation of Washington
Filed Apr. 11, 1966, Ser. No. 541,695
3 Claims. (Cl. 280—5)



1. A portable tank assembly for handling bulk materials comprising:
a frame having supporting wheels and pedestals for transporting the assembly supporting it at selected locations;
a plurality of cylindrical tanks on the frame arranged in inclined overlapping relationship to each other, each tank having all of its walls inclined to the horizontal at least 38 degrees;
supports on the frame extending up to the tanks and joined to the ends and the sides thereof;
a filling inlet to each tank at the top thereof; and
an outlet valve at the bottom of each tank.

3,371,940
VEHICLE VARIABLE HEIGHT SUSPENSION SYSTEMS
Alex H. Sinclair, Southfield, and Ted Kozowyk, Detroit, Mich., assignors to the United States of America as represented by the Secretary of the Army
Filed June 15, 1966, Ser. No. 559,045
4 Claims. (Cl. 280—43.23)

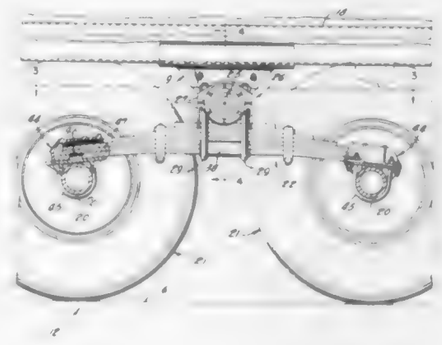


An apparatus for actuating and controlling the variable ground clearance of tracked or wheeled vehicles, comprising an hydraulically actuated road arm.

3,371,941
AXLE ASSEMBLY FOR DUMP TRUCKS
L. V. Preddy, Jr., Dallas, Tex., assignor to Dye Trucking Company, Dallas, Tex., a corporation of Texas
Filed June 13, 1966, Ser. No. 557,232
8 Claims. (Cl. 280—104.5)

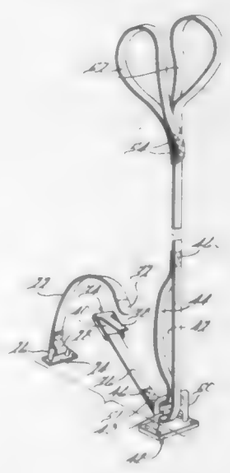
1. In a vehicle having a body and having a dual axle wheel unit, the combination of a wheel unit including a pair of axles arranged in tandem relation to each other, a pair of leaf spring units extending across the top sides of said axles and having their opposite ends connected thereto, respectively, and a trunnion shaft supporting said body for rocking movement about a transverse axis

and having its opposite end portions journaled in bearings therefor clamped to the top sides of said spring units intermediate their ends, said bearings each including a pair of semi-cylindrical clamping members loosely encircling the adjacent end of the trunnion shaft and having means clamping them together, and to the corresponding spring unit, a metal sleeve immediately surrounding said end portion of the shaft and providing a bearing for rotative adjustment of the shaft relative thereto, and a



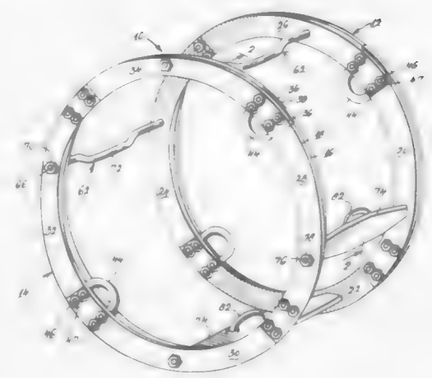
yieldable cylindrical element, formed of molded resilient material, immediately surrounding the sleeve and positioned between the sleeve and said clamping members said cylindrical element having an outside diameter greater than the inside diameter of the clamping members and frictionally engaging said sleeve and said clamping members and means in said end portions of said trunnion shaft communicating with the inside of said sleeves for lubricating said sleeves and the opposing surfaces of said shaft.

3,371,942
COMBINATION SEAT BELT AND UPPER TORSO RESTRAINT
Vincent A. Buck, Huntington Woods, and Edmund G. Nagle, Bloomfield Hills, Mich., assignors to Allen Industries, Inc., a corporation of Delaware
Filed Sept. 1, 1966, Ser. No. 576,667
7 Claims. (Cl. 280—150)



1. A combination seat belt and upper torso restraint for an occupant of a seat of a vehicle, the seat including a seat back and a seat proper mounted on the vehicle framework comprising first anchoring means on the vehicle framework, first strap means connected to said first anchoring means and adapted to extend upwardly and over the waist region of an occupant, second anchoring means on the vehicle framework, second strap means formed with loop means disposed intermediate of the ends thereof, said loop means engageably connected to said second anchoring means and providing relative longitudinal movement of said second strap means between a first stop position and a second stop position spaced therefrom as defined by the length of said loop means, one end portion of said second strap means adapted to extend upwardly and rearwardly of the seat back and forwardly adjacent the upper edge thereof and formed with engaging means for engaging an occupant's upper torso, the other end portion of said second strap means adapted to extend forwardly around an occupant's waist region and further including coacting means thereon for engaging mutual coacting means on the end portion of said first strap means for adjustably tensioning said first and said second strap means.

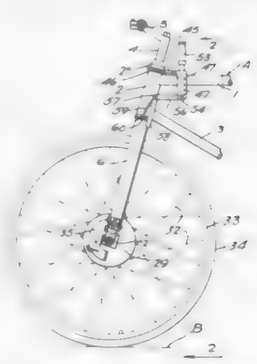
3,371,943
COLLAPSIBLE TUMBLING WHEEL
Herman F. Turgetto, 57—23 Catalpa Ave., Ridgewood, N.Y. 11227
Filed Mar. 9, 1966, Ser. No. 533,076
5 Claims. (Cl. 280—206)



This invention relates generally to certain new and useful improvements in an occupant-propelled tumbling and rolling apparatus through the medium of which the occupant is given exercise.

The apparatus has an open-work frame or wheel characterized by a pair of coplanar axially aligned hoops or rings, means for joining the rings rigidly together and means in the space between the hoops for accommodating the occupant in a stretched position.

3,371,944
VARIABLE AXIS CENTER WHEEL
James W. Daniels, Rte. 3, Box 200W, Tallahassee, Fla. 32301
Filed Apr. 8, 1966, Ser. No. 541,208
8 Claims. (Cl. 280—229)



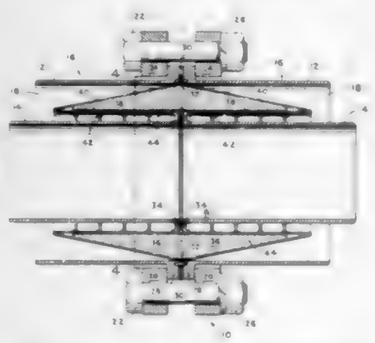
1. A variable axis center wheel comprising a wheel rim, an axle, a tubular axle housing rotatably supported on and having said axle extending therethrough, a hub

having a pair of spaced apart side walls, means connecting said hub to said wheel rim, both of said hub side walls having a straight edged opening therethrough, said axle housing having straight recesses in both ends thereof with said hub side wall edges slideably positioned therein, a locking trip plate pivotally mounted on one of said hub side walls and having a tooth, said axle housing having side slots each capable of receiving said locking trip tooth therein for retaining said axle housing at a given position relative to said hub, said locking trip plate having a pair of lateral flanges, operable means capable of engaging one of said locking trip plate flanges as desired to pivot said locking trip plate disengaging said tooth from one of said axle housing side slots at a time and resilient means tending to retain said tooth in one of said axle housing side slots at a time.

3,371,945
ADJUSTABLE LIFT LINK
Kenneth C. Adams and Gerald W. Bernhoft, Wauwatosa, Wis., assignors to Allis-Chalmers Manufacturing Company, Wauwatosa, Wis.
Filed June 6, 1966, Ser. No. 555,602
4 Claims. (Cl. 280—461)

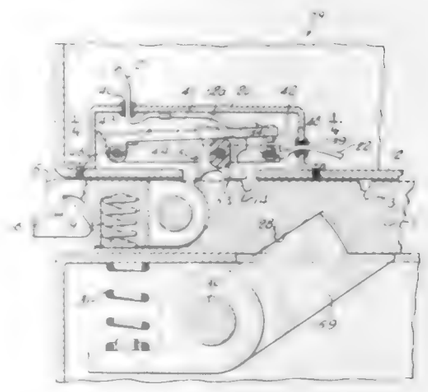
An adjustable lift link for use with hitching devices on a tractor.

3,371,946
CRYOGENIC COUPLING
Gustave A. Bleyle, Jr., 6 Russet Lane, Lynnfield, Mass. 01940; Arthur Sullivan, 15317 DePauw St., Pacific Palisades, Calif. 90272; Ross D. Randall, Pukham Hill Road, Sherborn, Mass. 01770; and Henry W. Boger, 67 Woodland Road, Westwood, Mass. 02090
Filed Nov. 2, 1965, Ser. No. 506,029
11 Claims. (Cl. 285—47)



A cryogenic coupling for double-walled vacuum insulated cryogenic conduits in which the inner seal for the inner conduit includes a spacing ring thicker than the outer seal spacing ring to prestress a bellows member operative to mechanically space the inner conduit from the outer conduit. The inner seal is a one-way seal, acting against pressures within the inner conduit, and will allow pressure built up in the space between mated coupling members (each having a bellows member) to be released into the inner conduit. Additionally, an annular seal spacer is designed to be placed on one of the mating coupling members to hold the spacer in place while mating the couplings. Further, an insulating member conforming to the contour of the opposed bellows members forming the mating coupling members is utilized, which insulating member is a one piece unitary fiberglass insulator having its fibers oriented circumferentially with respect to the axis of the coupling and which is coated with a porous material to allow gases to pass through the insulator and thus allow gases into the spaces between the interstices of the glass fibers.

3,371,947
SAFETY LOCK
James Robert Gridley, 2 Drawbridge Drive, Albany, N.Y. 12203
Filed Feb. 4, 1966, Ser. No. 525,158
8 Claims. (Cl. 292—144)

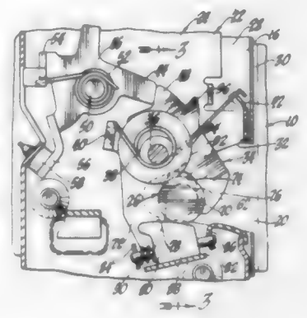


1. A door locking mechanism comprising in combination a housing, a bolt slidably mounted in said housing and having a plurality of grooves in one surface thereof, switch means comprising a pair of contact points, a pair of hinged contact point supporting members, ratchet cam means rotatably mounted on one of said contact point-supporting members and in operative contact with the grooved surface of said bolt and electro-mechanical means controlled by said switch means for exerting a pull on said bolt.

3,371,948
CLOSURE LATCH
Alfonsas Velavicius, Dutroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Feb. 9, 1966, Ser. No. 526,092
4 Claims. (Cl. 292—216)

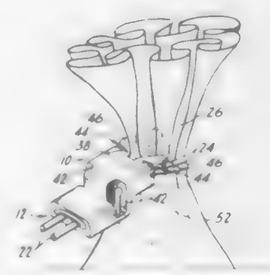
A door lock includes a latch frame and a fork type bolt is pivotally mounted on this frame by a pivot stud for movement between latched, unlatched and intermediate latched positions. A coil torsion spring surrounds the pivot stud and is interconnected between the latch bolt and the frame to bias the bolt to unlatched position. A releasable detent is engageable with either one of two shoulders of the bolt to retain the bolt in latched or intermediate latched positions.

A striker pin includes a shank and an unlatched flanged head. When the bolt is in either latched position, the shank of the striker is received within the bolt throat and the flanged head of the striker is engaged by both a spring biased wedge and a torus of mechanical rubber



to locate the shank of the striker within the bolt throat. The torus is supported by the coils of the torsion spring which surround the bolt pivot.

3,371,949
BAG SEAL INCLUDING A UNITARY, DEFORMABLE SEALING ELEMENT WITH DEFORMABLE BAG GRIPPING ARMS
Winfred M. Brooks, West Orange, and Sigurd M. Moberg, East Orange, N.J., assignors to E. J. Brooks Company, Newark, N.J., a corporation of New Jersey
Filed Sept. 1, 1966, Ser. No. 576,684
4 Claims. (Cl. 292—308)



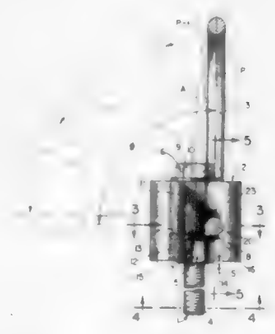
A bag sealing device comprising a cord which extends through passages in the body portion of a lead block providing a loop portion engageable about a bag neck or the like; the block having inelastic integral spaced fingers in side by side relationship for disposition at opposite sides of the bag neck, and having opposed gripping surfaces to engage the neck of the bag therebetween. When the loop portion is tightened the bag neck is forcefully wedged between the surfaces causing the fingers to bend away from each other, and tangentially engage adjacent parts of the bag neck and to hold the bag neck tightly between the fingers.

3,371,950
TENNIS BALL RETRIEVER AND STORAGE UNIT
Jacob Stap, 542 Elm St., Deerfield, Ill. 60015
Filed Aug. 3, 1966, Ser. No. 570,013
7 Claims. (Cl. 294—15)

A device for retrieving a multiplicity or a single tennis ball from a tennis court playing surface, which device automatically stores a multiplicity of tennis balls, characterized by a receptacle having a grate in its bottom of relatively rigid bars spaced apart slightly less than the diameter of a used tennis ball so that the receptacle may be placed over the balls resting on a court and pushed downwardly on the court surface automatically squeezing the balls into the receptacle, raising balls already in the receptacle thereabove and retaining all of the retrieved balls in the receptacle until manually poured or removed

from the open upper end of the receptacle; in preferred form, there being a handle above the receptacle for manipulation by a person standing upright on the playing surface.

3,371,951
MATERIAL HANDLING FITTINGS
John G. Bryant, 15 Ridgewood Road, Radnor, Pa. 19087
Continuation of application Ser. No. 479,796, Aug. 16, 1965. This application Dec. 19, 1966, Ser. No. 611,510
8 Claims. (Cl. 294—82)

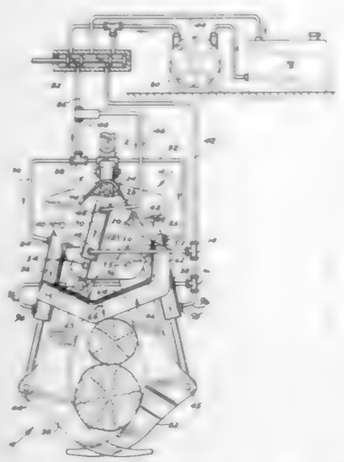


A materials handling fitting including a rotatable eye and a ring-like means on the eye and movable with respect thereto, the eye and the ring-like means cooperating whereby the fitting is aligned with respect to the loading and the lifting means to maximize the use of the tensile and compressive characteristics of the metal comprising the fitting.

3,371,952
LOG GRAPPLE WITH GRIPPER MEANS
Richard H. Hunger, Ashland, Wis., assignor to Beloit Corporation, Beloit, Wis. a corporation of Wisconsin
Filed Oct. 24, 1965, Ser. No. 504,553
10 Claims. (Cl. 294—88)

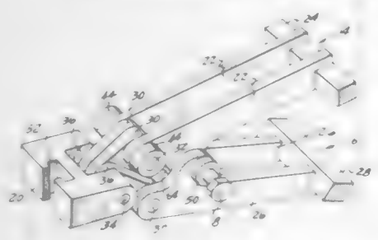
Log grappling apparatus having a pair of coopertaing jaws pivotally connected to a supporting head, and hydraulically actuated between a spread apart position and a log grapple position. A hydraulically actuated gripper arm is mounted on the head and has a pair of angled portions whereby a force is applied to the logs toward

the opening end of the jaws regardless of the number of logs between the jaws. A hydraulic circuit actuates



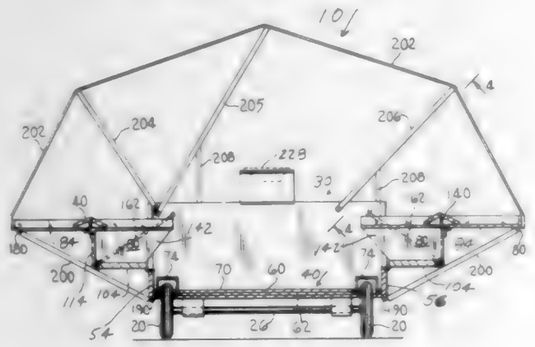
the gripper arm to apply a force to the logs after the jaws are in the log grapple position.

3,371,953
GRIPPER
Leland F. Blatt, Grosse Pointe, Mich. (24121 Mound Road, Warren, Mich. 48091)
Continuation-in-part of application Ser. No. 550,193, May 16, 1966. This application Mar. 16, 1967, Ser. No. 623,668
5 Claims. (Cl. 294—88)



A power cylinder-operated heavy duty jaw-type gripper is constructed to withstand and apply extremely high gripping forces by the provision of a rigid compact mechanism which is fully supported in all directions to substantially reduce stresses and deflections.

3,371,954
CAMPING TRAILER
Ivar F. Larsson, 198 Long Hill Road, Oakland, N.J. 07436
Filed Jan. 12, 1966, Ser. No. 520,271
4 Claims. (Cl. 296—23)

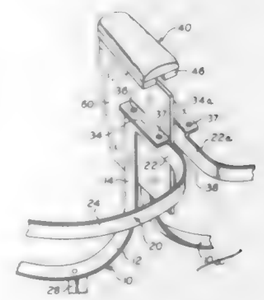


The disclosure is of a camping trailer which includes the usual body including a floor, front and rear walls, and two side walls. A folding bed assembly, comprising first and second beds, is built into a hinged panel in each side wall in such a way that the beds are completely inside the trailer when they are closed, and they open sideways when they are to be used. In each bed assembly, the first bed is built on the hinged panel in each side wall of the trailer as a base and has a mattress floor spaced from the side wall panel to provide a first storage space therebetween. The second bed is hinged to the first and includes a mattress floor which is spaced from the mattress floor of the first bed when the bed assembly is closed, to provide a second storage space therebetween.

3,371,955
SAFETY SHADE
Jeff M. Herrington, Sr., 1724 E. Brainard St., Pensacola, Fla. 32503
Filed Oct. 19, 1965, Ser. No. 497,804
13 Claims. (Cl. 296—97)

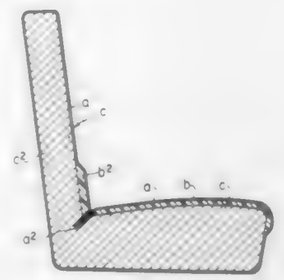
An adjustable light shielding structure for installation in the interior of a vehicle is provided which possesses improved shading capabilities without the concomitant interference with the comfort of a driver or passenger in other respects, particularly during summer driving. The adjustable and substantially continuous safety shade comprises a central visor, an outer auxiliary visor possessing articulated panels, hinges for pivotally connecting the outer auxiliary visor adjacent the outer extremity of the central visor and the adjoining articulated panels to each other, and means adapted for connecting the central visor to a vehicle.

3,371,956
CHAIR-TABLET ARM CONSTRUCTION
John Wilberforce Noel Jordan, Sheerness, Kent, England, and James J. Chierchiaro, Easton, Pa., assignors to J. G. Furniture Company, Inc., New York, N.Y., a corporation of New York
Filed Oct. 28, 1966, Ser. No. 590,413
11 Claims. (Cl. 297—162)



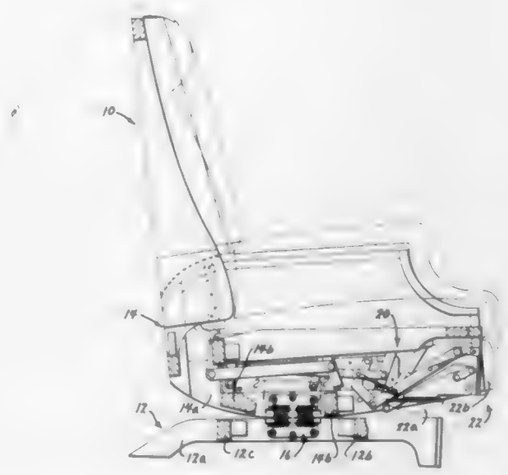
An arm rest and writing tablet assembly for disposition between the frames of two adjacent chairs, the assembly comprising means for securing it to at least one of the chairs, hinge means for pivotally mounting a movable arm rest or cover about a transverse axis, and hinge means on the bottom of the cover and extending longitudinally thereof for pivotally mounting a writing tablet on the bottom of the cover in a position to move in between the two chair frames when the cover is in covering relation therewith.

3,371,957
LOOSE COVERS FOR SEATS AND THE LIKE
Alexander J. Cook, Oldham, England, assignor to Medlock Manufacturing Company Limited, Oldham, England, a company of Great Britain
Filed June 14, 1966, Ser. No. 557,528
Claims priority, application Great Britain, June 17, 1965, 25,780/65
1 Claim. (Cl. 297—219)



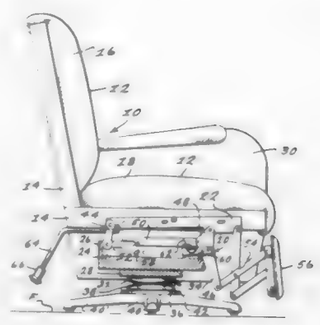
A loose cover especially for automobile and like seats comprises an envelope for stretchable textile material capable of fitting over the seat and back portions of different size seat assemblies and having a pad of foamed plastic bonded to the underside of the envelope overlying said seat portion to non-slidably grip the seat portion while the remainder of the envelope is free to stretch and slide on the assembly in accord with driver movements and the like. Where the seat assembly is an arm chair, non-slip pads are bonded to the envelope overlying the arms.

3,371,958
COMBINATION RECLINING AND ROCKING CHAIR
Daniel F. Caldemeyer, Vanderburgh County, and Lloyd O. Caldemeyer, James B. Mosier and John T. Gates, Evansville, Ind.; said Mosier and said Gates assignors to National Furniture Manufacturing Co., Inc., Evansville, Ind., a corporation of Indiana
Filed Aug. 10, 1965, Ser. No. 478,568
4 Claims. (Cl. 297—269)



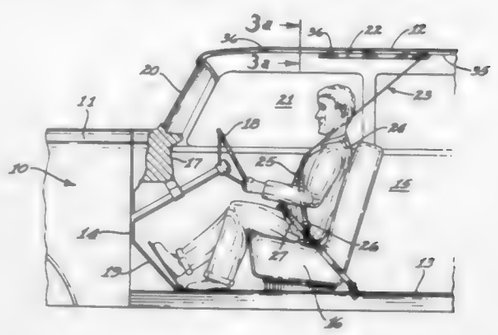
A combination reclining and rocking chair characterized by a movable seat and back carrying frame portion having side members directly mounted on the side members of a fixed base frame portion and including a concealable foot rest arrangement which permits high-legged styling.

3,371,959
STOP MEANS FOR A RECLINER CHAIR
Samuel E. Gordin, Fort Smith, Ark., assignor to Hickory Spring Manufacturing Co., Inc., Hickory, N.C., a corporation of North Carolina
Filed Nov. 4, 1966, Ser. No. 592,032
6 Claims. (Cl. 297—310)



This invention relates generally to stop means for recliner chairs of the type having a selectively tiltable body-supporting structure mounted on a base member for rocking motion with respect thereto, wherein the stop means is mounted on the body-supporting structure and is operative to prevent rocking of the body-supporting structure when it is in a fully reclined position while permitting rocking thereof in all other positions, and is especially applicable to swivel-type recliner chairs wherein the stop means is operative in any facing direction of the body-supporting structure.

3,371,960
VEHICULAR SAFETY HARNESS APPARATUS
Leon F. Bayer, 1640 E. Bethany Home Road, Phoenix, Ariz. 85016, and Jack L. Bayer, 9021 N. 18 Drive, Phoenix, Ariz. 85020
Continuation-in-part of application Ser. No. 343,391, Feb. 7, 1964. This application Apr. 18, 1966, Ser. No. 552,661
10 Claims. (Cl. 297—386)

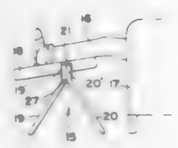


This invention is concerned with safety harness apparatus for use in vehicles, such as motor cars or aircraft. The safety apparatus is of the hydraulic type, and is constructed to permit free normal movements of the operator. However, any sudden forward movement of the operator causes the apparatus to lock and to hold him firm. Added features of the invention include a means for reducing excessive stress on the operator in the event he is thrown forward with a high rate of speed, such as upon impact with another vehicle. Also, an added feature is the provision of means for adapting the apparatus to be used in conjunction with seat ejection mechanisms in aircraft, and to provide means for drawing the pilot firmly back against the seat, when such ejection is effectuated.

3,371,961
FITTING FOR MOUNTING HEADRESTS
Billie E. Colgan, Sunland, Calif., assignor to American Safety Equipment Corp. of California, Sherman Oaks, Calif., a corporation of California
Filed Jan. 30, 1967, Ser. No. 612,594
4 Claims. (Cl. 297—397)

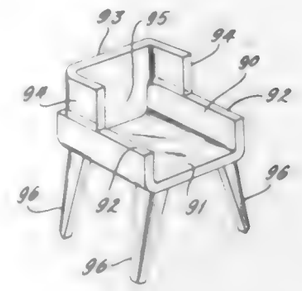
An improved fitting construction for mounting round or rectangular cross-section headrest supporting frame members to round bar or flat sheet metal framing of vehicle seat backs. A base member with a concave surface to abut round frame members of vehicle seat back constructions and a crown portion to receive and mount round or flat headrest support frame members or bars with an associated thumb screw is provided with an additional cooperating, reinforcing and base enclosing housing or bell to fit over the base member, the base member crown portion protruding through an aperture in the housing or bell to receive and mount a headrest supporting frame member, to continuously bear against flat seat back framing about said base member and to transmit loading on the headrest into said seat back frame about said base member.

3,371,962
LEG RESTS
John Bellock, 71 Essex Drive, Tenefly, N.J. 07670
Filed Mar. 13, 1967, Ser. No. 622,683
5 Claims. (Cl. 297—439)



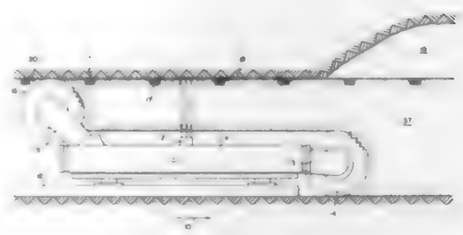
Two identical U-shaped members arranged in downwardly divergent relation, form a stand for a panel which they straddle. The distal end portion of each of the arms of said members, extend vertically upwards. Those on one of said members, act as stops for those on the other. There are two small plates, positioned between the side edges of the panel and said distal end portions of the U-members. Said distal portions of one of the U-members, being secured to said plates respectively. Said panel being mounted on pintles extending from said plates, for swinging movement about an axis spaced a distance from the center of gravity of the panel. The panel is separable from the assembly. The stand is compactly foldable. Upon assembly to use condition, the plates are preferably within the confines of the side edges of the panel, and said distal end portions of the U-members, are within the confines of the plates.

3,371,963
MANUFACTURE OF FURNITURE
Forrest D. Weller, East Alton, Ill., assignor to Alton Box Board Company, Alton, Ill., a corporation of Delaware
Filed July 5, 1966, Ser. No. 562,635
7 Claims. (Cl. 297—445)



Furniture parts cut from paper tubes having parallel sides with intervening rounded corners.

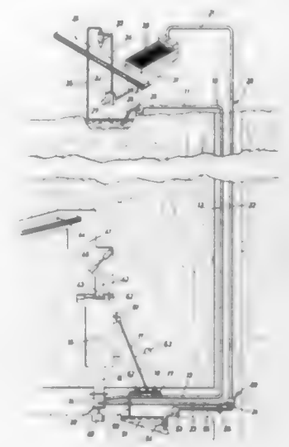
3,371,964
METHOD AND APPARATUS FOR SCANNING AND MONITORING THE ROOF OF SEAMS MINED BY CUTTING MACHINES
Karl-Heinz Weber, Witten-Heven, Germany, assignor to Gebr. Eickhoff, Maschinenfabrik and Eisengiesserei m.b.H., Bochum, Germany, a corporation of Germany
Filed June 20, 1966, Ser. No. 558,727
Claims priority, application Germany, June 30, 1965, E 29,612
5 Claims. (Cl. 299—1)



1. Method of scanning and monitoring the roof of a seam mined by a cutting machine having a support arm carrying a cutting tool for cutting the seam along a face thereof and following the seam roof to expose the latter as the cutting machine advances along the face of the seam, said method comprising the steps of producing a first signal in response to the inclination of said support arm while cutting along the seam face is in progress, scanning a portion of the seam roof exposed by a previous cut along the face of the seam by means of ultrasonic altimeter means disposed on the cutting machine, producing a second signal responsive to said ultrasonic altimeter means, and recording continuously the difference between said first and second signals while cutting along the seam face is in progress.

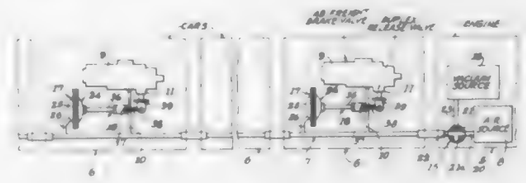
3,371,965
HYDRAULIC HOISTING OF DISCRETE SOLIDS
James A. MacLellan, Manitoba, Canada, assignor to Sheritt Gordon Mines Limited, Toronto, Canada, a company of Ontario
Filed June 10, 1966, Ser. No. 556,738
10 Claims. (Cl. 302—14)

A hydraulic hoist for discrete solids including liquid supply and solids hoisting conduits extending from above the ground to a solids loading level beneath the surface and a pump for discharging liquid under pressure into the supply conduit for circulation up the hoisting conduit. A loading system at the lower level includes a first chamber for receiving solids at atmospheric pressure and an associated loading chamber which receives solids from the



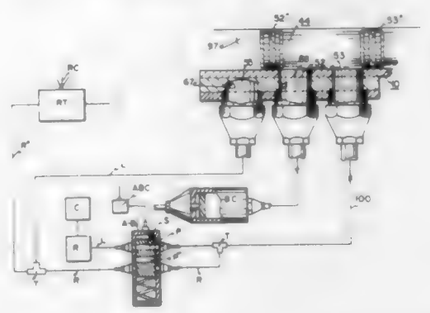
first chamber and introduces them into the hoisting conduit at a velocity at or near the hoisting velocity while permitting uninterrupted circulation of liquid through the liquid supply and hoisting conduits.

3,371,966
BRAKE-BLEEDING SYSTEM
Loren P. Conover, 802 E. Virginia Ave., Glendora, Calif. 91740, and Hubert W. Gibbins, 3402 S. Lamar, Amarillo, Tex. 79109
Filed Jan. 25, 1967, Ser. No. 611,644
6 Claims. (Cl. 303—69)



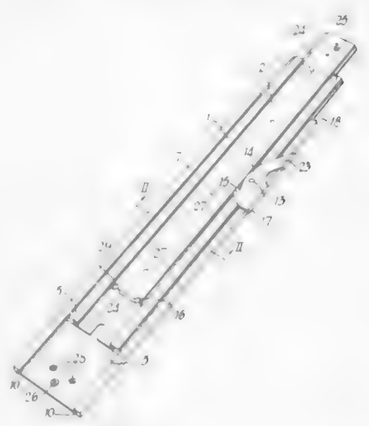
Bleeding air brakes of a train of railroad cars (particularly freight cars) from the engine instead of the common practice of bleeding the brakes of the cars, one at a time, by hand operation.

3,371,967
VALVE STRUCTURE
Ivan A. Farnworth, 441 S. State, Orem, Utah 84057
Filed Dec. 27, 1966, Ser. No. 606,515
11 Claims. (Cl. 303—69)



1. A valve including, in combination, structure defining a valve chamber including an inner wall and, disposed therethrough, a medial function port, a source port disposed on one side thereof, and an exhaust port disposed on the remaining side thereof, all of said ports being mutually longitudinally spaced with respect to each other; a valve shuttle longitudinally slideably disposed within said chamber and having a medial portion spaced from said inner wall and a pair of mutually spaced, transverse valve lands disposed on respective opposite sides of said medial portion and slideable and sealingly engaging said inner wall, said valve lands being mutually spaced apart, and said chamber being so dimensioned that in valve neutral position said function and source ports are disposed between said valve shuttle lands and in valve operating position one of said lands is sealingly disposed between said function and source ports, interrupting communication therebetween, and the remaining valve land is disposed beyond said exhaust port, providing communication between said exhaust port and said function port, said remaining valve land during valve neutral position being sealingly disposed between said function and exhaust ports, said structure also being provided with an auxiliary outlet port disposed between said valve lands during valve neutral position and situated beyond said valve lands of said valve shuttle at valve operating position, said structure also being provided with an auxiliary inlet port disposed beyond said valve shuttle with respect to its valve lands during valve neutral position and also during valve operative position; auxiliary valve means for selectively providing communication between said auxiliary inlet port and said auxiliary outlet port for urging said valve shuttle into valve operating position; control means for selectively operating said auxiliary valve means; return means for returning said valve shuttle from valve operating position to valve neutral position when fluid pressure at said source port is reduced; and stop means for determining valve shuttle neutral position when said valve shuttle is returned thereto by said return means.

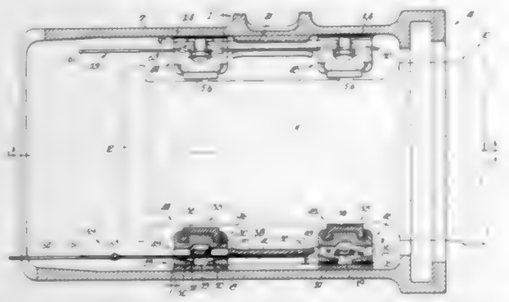
3,371,968
EXTENSION SLIDE
George Albert Loake, Walton-on-Thames, England, assignor to Southborough Group Limited, a British company
Filed Mar. 19, 1965, Ser. No. 441,083
Claims priority, application Great Britain, Mar. 24, 1964, 12,494/64
2 Claims. (Cl. 308—3.6)



An extension slide for a filing cabinet drawer has three slide members mounted one inside another by ball, or plain nylon, bearings arranged in lateral gaps between the slide members and protected externally by tongue-and-groove seals, the intermediate and outermost slide members being channel-shaped. A releasable latching member co-operating with a lateral guiding surface of the innermost slide member is pivoted on the intermediate member

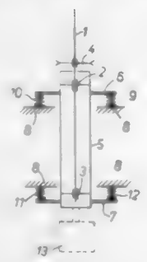
and can engage behind one end of each of the innermost and outermost members to lock the slide in its fully extended condition.

3,371,969
RAILWAY CAR JOURNAL BOX CONSTRUCTION
Edward Payson Smith, Winnetka, and Finn Jensen, Riverdale, Ill., assignors to Illinois Railway Equipment Company, Chicago, Ill., a corporation of Illinois
Filed Apr. 9, 1965, Ser. No. 446,901
18 Claims. (Cl. 308—40)



Journal guide supports on the inner vertical side walls of a railway journal box are arranged to receive downwardly movable journal guides by means of cooperating vertically extending T-slot and T-member means which hold the journal guides in a preliminary manner for subsequent receipt of individual keys to hold the journal guides fixedly in operative position.

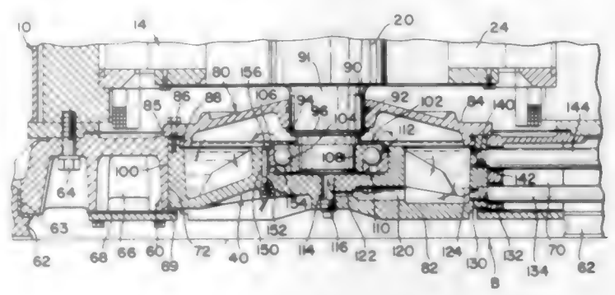
3,371,970
MOUNTING FOR HIGH-SPEED VERTICAL SHAFTS
Karl Beerli, Niederuster, Zurich, Switzerland, assignor to Spindel-, Motoren- und Maschinenfabrik A.G., Uster, Zurich, Switzerland
Filed July 5, 1966, Ser. No. 562,685
Claims priority, application Switzerland, July 8, 1965, 9,576/65
16 Claims. (Cl. 308—140)



1. A mounting for high-speed vertical shafts, including: a vertical shaft; two support means spaced along the length of the shaft for supporting the shaft; first means for resiliently mounting each of said support means for horizontal and vertical movement on a further support; and second means for permitting inclination of the shaft with respect to at least one of said support means; and bearing means for permitting rotation of the shaft.

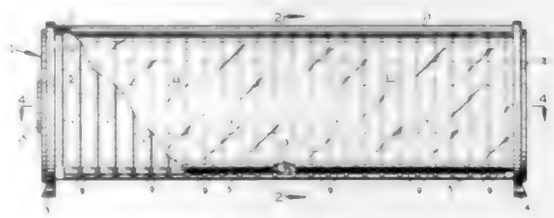
3,371,971
BEARING STRUCTURE FOR A VERTICAL MOTOR-GENERATOR UNIT
Alex Bozsvai, Chagrin Falls, Ohio, assignor to The Ohio Crankshaft Company, Cleveland, Ohio, a corporation of Ohio
Filed Feb. 1, 1966, Ser. No. 524,266
12 Claims. (Cl. 308—187)

There is provided a bottom end plate for a vertical motor-generator unit which includes a bearing housing connected onto the shaft of the motor and generator and adapted to be slipped into an opening in the bottom end plate. This housing includes a bearing chamber with a lower inlet and an upper opening, a thrust bearing in the



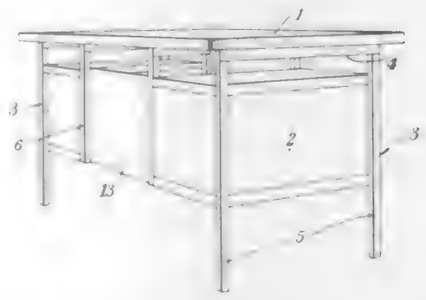
chamber, a reservoir around the chamber and in communication with the inlet and means for maintaining a lubricant level in the reservoir above the upper opening. In this manner, the bearing pumps lubricant through the thrust bearing.

3,371,972
SELECTIVE REEL DISPENSER
Jacque Fresco, 3112 SW. 23rd St., Miami, Fla. 33133
Filed Mar. 7, 1967, Ser. No. 621,305
6 Claims. (Cl. 312—17)



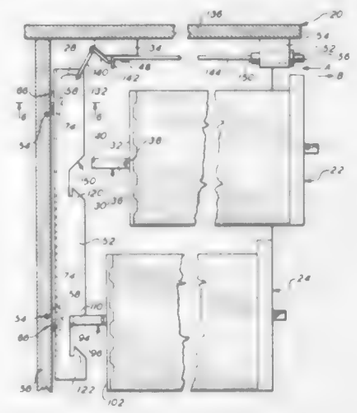
A device for storing reels in parallel relation and selectively dispensing same by depressing indexed tabs corresponding to the reels.

3,371,973
OFFICE FURNITURE AND TABLES
René Vincens, Neuville-les-Dieppe, Seine-Maritime, France, assignor to Societe Civile de Recherches et d'Etudes Industrielles, Neuville-les-Dieppe, France
Filed Aug. 1, 1966, Ser. No. 569,152
Claims priority, application France, Aug. 23, 1965, 29,126, Patent 1,456,004
3 Claims. (Cl. 312—194)



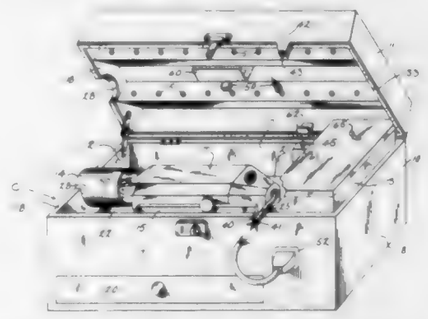
An article of metallic office furniture comprises two rigid leg-forming frames of inverted U-shape, a top recurred to the base portions of the frames, two intermediate U-shaped frames which have their base portions recurred to the top and are similar and parallel to the leg-forming frames but have shorter legs, and cabinets carried by cooperating support elements on the legs of the leg-forming frames and of the intermediate frames.

3,371,974
COMPONENT INTERLOCKING AND LOCKING APPARATUS FOR CABINETS
Raymond J. Vermeersch, Burlington, Iowa, assignor to The Leopold Company, Burlington, Iowa, a corporation of Delaware
Filed Feb. 13, 1967, Ser. No. 615,642
16 Claims. (Cl. 312—218)



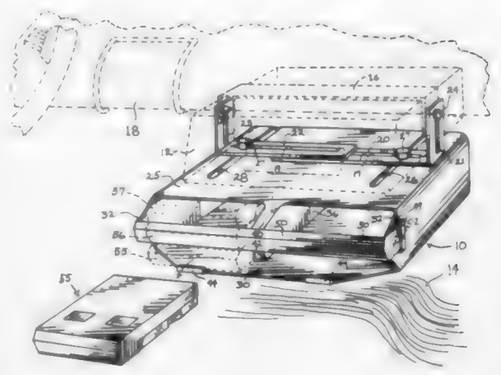
An interlocking apparatus for locking all components, except one, within the confines of a cabinet upon initial movement of any one component from a position confined within the cabinet towards a position extending therefrom, and for locking all components within the cabinet in response to actuation of a lock. A strap and associated lock-bar are provided for each component, with the strap disposed on its component for engagement with a cam surface on its associated lock-bar, and with latching hooks disposed on said associated lock-bar, for engagement with the straps disposed on the other components. As the component and its strap begin to move away from the associated lock-bar, the lock-bar falls due to gravity and its latching hooks engage the straps on the other components to prevent movement thereof. One of the lock-bars also has disposed thereon a set of locking hooks disposed to engage the straps of all the components upon actuation of said one lock-bar in response to operation of a lock, to thereby lock all the components against movement.

3,371,975
COOLING AND CARRYING BOX FOR ELECTRIC TOOLS AND APPLIANCES
Henry E. Meltzer, 1745 Flett St., Racine, Wis. 53403
Filed Feb. 21, 1967, Ser. No. 617,558
5 Claims. (Cl. 312—236)



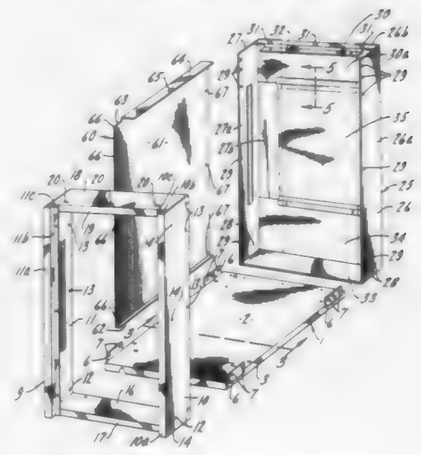
An apparatus and cooling box for holding, carrying and cooling portable electrically driven tools and appliances such as barber clippers, small electric drills, grinders, etc. The box being of a substantially rectangular shape having a hinged lid at its upper end. A compartment in said box and electric motor carrying a suction fan adjacent one end of said compartment. The wall opposite the motor and suction fan being provided with a screened aperture. The appliance being set in the compartment between the aperture and motor and switch actuating means operable by the opening and closing of the lid to start the motor when the lid is closed and to circulate air about the appliance for cooling the same. The box being also provided with an exhaust opening adjacent the suction fan. The electric circuit arrangement also providing means whereby the source of current to the electric appliance can be cut off when the lid is closed and electric motor actuated.

3,371,976
AUTOMOTIVE STEREO CARTRIDGE HOLDER
Theodore Ritz, Jr., 9939 Deering, Livonia, Mich. 48150
Filed June 21, 1966, Ser. No. 559,174
7 Claims. (Cl. 312—245)



An automotive stereo cartridge holder is disclosed for use in an automobile passenger compartment which is closed except at the front thereof and which has a retainer bar dividing the front opening into a top front opening through which stereo cartridges are inserted into said holder and into a bottom front opening through which stereo cartridges are removed from said holder, and lift-over stop means preventing movement forwardly out of the holder of the lowermost stereo cartridge, and the retainer bar preventing such forward movement of the other stacked stereo cartridges stored in said holder.

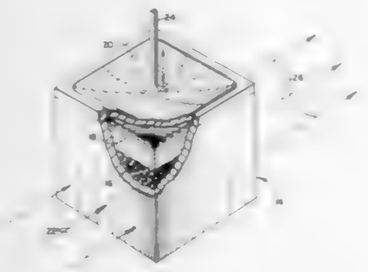
3,371,977
CABINET ASSEMBLY
James M. McCabe, Chicago, Ill., assignor to Coe Laboratories, Inc., Chicago, Ill., a corporation of Illinois
Filed Apr. 5, 1965, Ser. No. 445,627
5 Claims. (Cl. 312—257)



1. For use in forming undercounter cabinets, a generally rectilinear base formed of sheet metal and having a relatively flat upper surface, a plurality of brackets spaced-

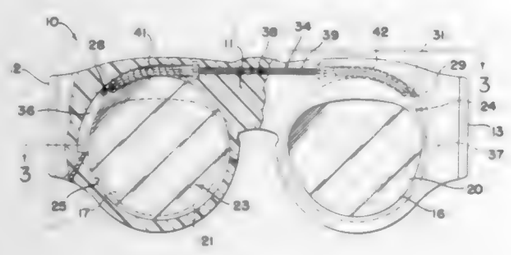
ly upstanding from said surface, a forward frame member formed of sheet metal and slidable along and about a forward portion of said base and having spaced vertical strips overlying some of said brackets, a rear frame member formed of sheet metal and slidable along and about a rear portion of said base and having spaced vertical strips overlying others of said brackets, said strips and brackets having apertures alignable when said strips are in position on said base, each of said vertical strips being of substantial greater width than thickness, each of said frame members including upper and lower horizontal strips joining said vertical strips, the vertical strips of said forward frame member extending forwardly of its horizontal strips to form a door frame.

3,371,978
PRESSURE-SENSITIVE OPTICAL CELL
Edwin Matovich, Costa Mesa, Calif., assignor to North American Aviation, Inc.
Filed Feb. 12, 1964, Ser. No. 344,292
5 Claims. (Cl. 350—160)



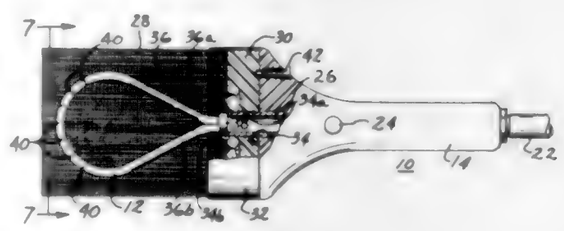
A transparent housing contains a compressible liquid, the index of refraction of which varies as a function of pressure. Immersed in the liquid are a plurality of particles of transparent incompressible material. When appropriate pressure is applied to the fluid, its index of refraction changes to match that of the material, thereby permitting transmission of light through the cell. When such matched index condition does not exist, incident light is scattered by the interfaces between the particles and the liquid.

3,371,979
FLUID-FILLED VARIABLE DENSITY POLARIZING SUNGLASSES
Ronald J. Catanzaro, % William Beaumont General Hospital, 7417-B Hume St., El Paso, Tex. 79930
Filed Apr. 15, 1963, Ser. No. 273,057
1 Claim. (Cl. 351—49)



1. A variable density sunglass comprising a frame providing right and left eye apertures and including a bridge portion,
a first light polarizing lens fixedly secured in each of said apertures,
a second light polarizing lens rotatably mounted in each of said apertures and spaced from said first lens,
a third lens fixed y secured in each of said apertures on the side of said second lens opposite to said first lens,
said lenses having identical indices of refraction,
adjustable means mounted in said bridge portion of said frame and being operably connected to said second lens, whereby said second lens may be rotated relative to said first and third lens,
said first and third lenses with said frame defining a chamber,
fluid means disposed in said chamber and immersing said second lens,
said fluid having a refractive index closely approximating the refractive indices of said lenses,
said bridge portion including a cavity in communication with said fluid chambers,
said adjustab'e means comprising an elongated member longitudinally slidably disposed in the cavity in said bridge portion of said frame,
said member having end portions extending into said fluid chamber in each of said right and left apertures,
means securing each of said end portions respectively to one of said second lenses,
sealing means secured to said elongated member and said frame whereby the cavity in said bridge portion is isolated from said fluid chambers,
said sealing means comprising an extensible flexible tubular seal in each of said fluid chambers and surrounding a portion of said end portions of said member,
each of said seals having one end secured to said member and the other end secured to said frame adjacent to the juncture of said cavity and said chambers whereby the interior of said tubular seals is in communication with said cavity and the exterior of said tubular seals is exposed to the fluid in said chambers.

3,371,980
LIQUID COATING MATERIAL APPLYING APPARATUS
Stephen F. Stefely, 1729 N. Lotus Ave., Chicago, Ill. 60639
Filed Oct. 22, 1965, Ser. No. 501,748
8 Claims. (Cl. 401—285)



Liquid coating material applying apparatus includes a brush formed of a support block and bristles. A disperser introduces liquid coating material into the bristles and includes a continuous, apertured polyvinyl chloride tube having its ends joined to form a loop among the bristles. An enlarged portion is attached to the ends of the tube, and the loop is deformable so that it can be inserted into the brush through an opening in the support block. The enlarged portion engages the support block and holds the loop within the brush.

CHEMICAL

CYCLOHEXENOTHIAZOLE AZO DYES DYEING OF METALLIZED POLYOLEFINS
Shinya Itoh, Kyoto, Yoshitaka Kubota, Ohtsu-shi, and Masao Iizuka, Yokohama, Japan, assignors to Toyo Rayon Kabushiki Kaisha, Tokyo, Japan, a corporation of Japan
No Drawing. Filed Dec. 28, 1964, Ser. No. 421,640
Claims priority, application Japan, Apr. 7, 1964, 39/19,316
4 Claims. (Cl. 8—4)

Applicants dye metallized polyolefin fibers and other shapes with a metallizable cyclohexenothiazole azo dye with an OH group in the ortho position to the azo group on the coupler.

3,371,982
PROCESS FOR IMPROVING THE DYEABILITY OF POLYOLEFINS
Abraham Kutner, Newark, Del., assignor to Hercules, Incorporated, a corporation of Delaware
No Drawing. Filed Jan. 29, 1964, Ser. No. 341,093
4 Claims. (Cl. 8—97)

The dyeability of polyolefin articles with metal complexing dyestuffs is improved by treating the article with an organoaluminum compound such as triethyl aluminum and then hydrolyzing the treated article prior to or during the dyeing step. By this process, a fine dispersion of the hydrolysis product of the organoaluminum compound is produced in situ throughout the article.

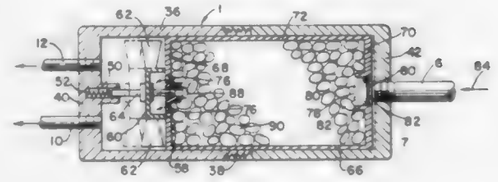
3,371,983
PREWETTING CELLULOSIC FABRIC BEFORE INTRODUCTION TO DEHYDRATING SOLUTION OF FORMALDEHYDE REACTANT IN A CONTINUOUS PROCESS
Richard P. Barber, Mooresville, and Vernon C. Smith, Greensboro, N.C., assignors to Burlington Industries, Inc., Greensboro, N.C., a corporation of Delaware
Continuation-in-part of application Ser. No. 136,418, Sept. 5, 1961. This application Dec. 4, 1961, Ser. No. 156,859
11 Claims. (Cl. 8—116.4)

1. A continuous process for increasing the wet wrinkle recovery of a cellulosic fabric comprising treating the fabric with an aqueous medium in which water is the sole essential liquid until the fabric contains 10–100% of its own weight of added water, substantially immediately thereafter passing the wet fabric into a dehydrating solution of formaldehyde at a temperature up to 90° C. for a period of up to 5 minutes whereby the formaldehyde reacts with said fabric to improve the wet wrinkle recovery, washing the thus treated fabric with water and then drying said fabric.

3,371,984
AIR FRESHENER
Joseph Patrick Kelly, Staten Island, N.Y., and George Herbert Fuller, Colonia, N.J., assignors to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware
No Drawing. Filed Sept. 6, 1963, Ser. No. 307,015
9 Claims. (Cl. 21—53)

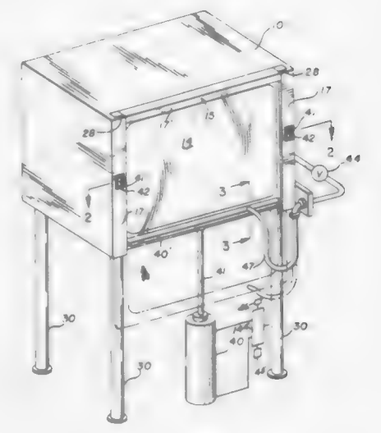
Solid air odorizing compositions, and such compositions in tablet form. The compositions contain a hydrated salt which loses some water of hydration when air is passed thereover at a rate of at least about 25 cubic feet per minute, and a perfume intimately admixed therewith.

3,371,985
VAPORIZER DEVICE
Edward W. Wyka, 716 Bermuda Road, West Babylon, N.Y. 11704
Filed Sept. 16, 1964, Ser. No. 396,849
5 Claims. (Cl. 21—91)



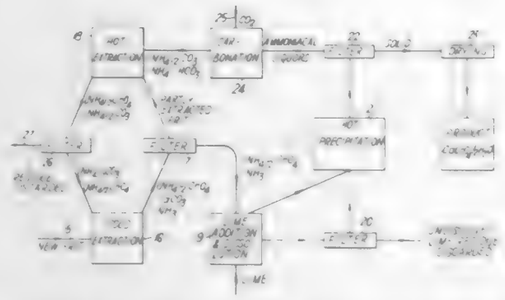
A disinfectant-crystal vaporizing device having a hollow cylindrical casing, a cylindrical cartridge removably received within the casing, said cartridge containing disinfectant crystals. An impeller assembly is rotatably and slidably mounted within the casing to sealingly cover outlet openings disposed through one end of the cartridge. When air is forced into said cartridge through an inlet opening at the other end thereof, the impeller assembly will be caused to rotate and uncover said outlet openings, to thereby permit egress of disinfectant vapors and to accomplish the uniform mixing thereof.

3,371,986
DOOR AND SEALING ARRANGEMENT THEREFOR
Gilbert G. Brown, Erie, Pa., assignor to American Sterilizer Company, Erie, Pa., a corporation of Pennsylvania
Filed Feb. 24, 1964, Ser. No. 346,726
5 Claims. (Cl. 21—98)



The present invention relates to a sterilizing chamber having a surface around the door and an inflatable seal which is controlled by pressure within the chamber so that the seal will not be released nor will the door be opened until the pressure within the chamber has fallen below a predetermined value. The chamber is characterized by a double wall connected together by a member that defines the surface on which the inflatable seal rests.

3,371,987
PROCESS FOR THE PRODUCTION OF CALCIUM CHROMATE
Clifford Alfred Vessey and James Thomson Farquhar, Harrogate, England, assignors to Associated Chemical Companies Limited, Harrogate, England
Filed July 20, 1964, Ser. No. 383,638
4 Claims. (Cl. 23—56)



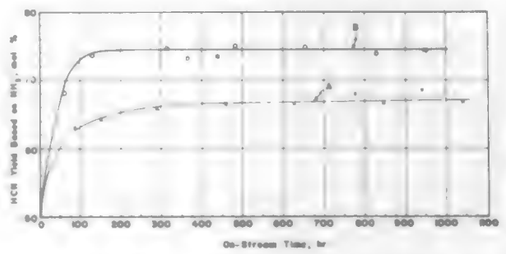
A process for the recovery of chromium values as calcium chromate from a roasted mix containing alkaline earth metal chromate comprising the steps of partly leaching said roasted mix in a first leaching step with a leach liquor containing, in a dissolved state, ammonia and carbon dioxide to yield an aqueous solution containing ammonium chromate and a partially extracted insoluble mix. The insoluble material is then removed to obtain a liquor containing, in a dissolved state, ammonia and ammonium chromate. This liquor is treated, at room temperature, with lime to yield an aqueous solution containing dissolved calcium chromate and ammonia. The calcium chromate-ammonia containing aqueous solution is then heated to a temperature sufficient to precipitate calcium chromate, the solid calcium chromate is separated from the mother liquor containing dissolved calcium chromate and ammonia, and the separated calcium chromate precipitate is then dried. The mother liquor which contains dissolved calcium chromate and ammonia is cooled and carbonated to give a suspension of calcium carbonate in a solution containing ammonium bicarbonate and ammonium chromate. The partially extracted roasted mix which resulted from the first leaching step is then leached with the carbonated mother liquor to yield an extracted residue and a leach liquor containing, in a dissolved state, ammonia, carbon dioxide and ammonium chromate. The extracted residue is then discarded, and the leach liquor is utilized to leach a fresh quantity of roasted mix.

3,371,988
METHOD OF BENEFICIATING CLAY BY REMOVAL OF TITANIUM IMPURITIES
Robert N. Maynard and Bobby Ray Skipper, Cochran, and Nathan Millman, Macon, Ga., assignors to J. M. Huber Corporation, a corporation of New Jersey
No Drawing. Continuation-in-part of application Ser. No. 625,022, Mar. 22, 1967. This application Aug. 25, 1967, Ser. No. 663,221
10 Claims. (Cl. 23—110)

This disclosure covers a method of beneficiating kaolin clay by removing titanium impurities from a clay slurry. The process produces clays with a higher brightness than is possible with conventional treatment of the same clay.

3,371,989
CATALYST ACTIVATION
Bingham Y. K. Pan, Texas City, Tex., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
Filed Nov. 22, 1963, Ser. No. 325,584
3 Claims. (Cl. 23—151)

An improvement in the process for the production of hydrogen cyanide by the vapor-phase reaction of ammonia, natural gas and air in the presence of a platinum gauze catalyst which comprises activating the catalyst by passing the reactants in specified mole ratios and temperatures through it at a specific mass flow rate in the range from 1.28 to 1.45 lb./hr./layer of gauze/sq. in. of gauze surface until a maximum yield of hydrogen cyanide is obtained.



3,371,990
PRODUCTION OF HYDROGEN CYANIDE
Lawrence J. Krebaum, St. Louis, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Continuation of application Ser. No. 48,362, Aug. 9, 1960. This application July 19, 1963, Ser. No. 296,376
10 Claims. (Cl. 23—151)

1. The process for producing hydrogen cyanide which consists essentially of reacting an organic mononitrile with hydrogen at a temperature within the range from about 600° C. to about 850° C.

3,371,991
STABILIZATION OF WET PROCESS PHOSPHORIC ACID BY HEATING UNDER PRESSURE AND WITHOUT EVAPORATION
Frank J. Sergeys, Kensington, and Casimer C. Legal, Jr., and Gordon J. Turner, Baltimore, Md., assignors to W. R. Grace & Co., New York, N.Y., a corporation of Connecticut
Filed Jan. 6, 1964, Ser. No. 335,749
5 Claims. (Cl. 23—165)

Wet process phosphoric acid is stabilized by heating the acid for a relatively short period of time to above its boiling point under pressure while preventing volatilization. After cooling, the recovered wet process phosphoric acid may be shipped or stored over an extended time period without appreciable post-precipitation or sedimentation.

3,371,992
FORMATION OF CRYSTALLINE PYROPHOSPHORIC ACID
Chung Yu Shen, St. Louis, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed Mar. 24, 1965, Ser. No. 442,501
16 Claims. (Cl. 23—165)

Crystalline pyrophosphoric acid is formed by adding seed crystals of same to a dispersion of liquid polyphosphoric acid (78–82% P_2O_5) in a non-aqueous solvent. The temperature of this dispersion is then maintained at below the melting point of crystalline pyrophosphoric acid until conversion to the crystalline form is complete.

3,371,993
METHOD OF MAKING MAGNESIUM OXIDE FIBERS
Marshall H. Norwalk, Watkins Glen, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Dec. 21, 1964, Ser. No. 419,970
12 Claims. (Cl. 23—201)

Fibrous crystalline magnesium oxide is produced by reacting aluminum and magnesium oxide at a temperature of at least 1300° C. to form magnesium metal vapor which is further reacted with oxygen to form the fibrous product.

3,371,994
PRODUCTION OF PHOSPHINE
Edward James Lowe and Frederick Arthur Ridgway, Stourbridge, England, assignors to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York
No Drawing. Filed Apr. 1, 1963, Ser. No. 269,727
Claims priority, application Great Britain, Apr. 4, 1962, 12,942/62
6 Claims. (Cl. 23—204)

1. A method for manufacturing phosphine which comprises mixing phosphorus with a strong aqueous solution of an acid selected from the group consisting of orthophosphoric acid and condensed phosphoric acids at a temperature above 250° C., and collecting the evolved phosphine, wherein when white phosphorus is used as starting material conversion thereof to red phosphorus is allowed to proceed until a quantity of white phosphorus, between 0.1 and 4% by weight of the total phosphorus, remains, whereupon this quantity is maintained by continuous addition of further white phosphorus, water also being added as required, the reactants being agitated at least after the point of 50% conversion has been reached.

5. A method for manufacturing phosphine which comprises mixing phosphorus with a strong aqueous solution of an acid selected from the group consisting of orthophosphoric acid and condensed phosphoric acids at a temperature above 250° C., and collecting the evolved phosphine, wherein when white phosphorus is used as starting material conversion thereof to red phosphorus is allowed to proceed until about 50% of the white phosphorus has been converted to red phosphorus, the residual white phosphorus is then distilled off until the amount of white phosphorus which remains is between 0.1 and 4% of the total amount of phosphorus present, the red phosphorus is allowed to react while, at the same time, white phosphorus is added to maintain the presence at all times of an amount of white phosphorus between 0.1 and 4% of the total amount of phosphorus present.

3,371,995
METHOD OF MAKING MACROSCOPIC SILICON CARBIDE FIBERS WITH A SILICA SHEATH
Wallace W. Pultz, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed July 9, 1965, Ser. No. 470,729
9 Claims. (Cl. 23—208)

1. A method for manufacturing macroscopic fibers containing beta-silicon carbide crystals with a surface sheath of silica comprising the steps of providing a mixture of carbon and silica in a molar ratio ranging between about 1:1 to 5:1 in a reaction chamber, contacting said mixture at a temperature ranging about 1300°–1550° C. with an atmosphere containing at least one halide gas selected from the group consisting of hydrogen fluoride, hydrogen chloride, hydrogen bromide, and silicon tetrachloride, the halide gas having a partial pressure ranging about 25–350 mm. of mercury, maintaining said temperature and atmosphere for a period of time sufficient to attain the desired fiber formation after which the fibers are cooled to room temperature.

3,371,996
DIAMOND GROWTH PROCESS
Henry J. Hibshman, 6 Crabapple Lane, Plainfield, N.J. 07060
Filed Jan. 20, 1964, Ser. No. 338,766
5 Claims. (Cl. 23—209.1)

Diamonds are grown from diamond seed particles by contacting the seed particles with a gas consisting essentially of CO in the presence of catalytic amounts of at least one metal selected from the group consisting of the precious metals and nickel at temperatures in the range of 600° C. to 1100° C. and at pressures of 1 to 2000 atmospheres.

3,371,997
PROCESS FOR MAKING HIGH STRUCTURE CONDUCTIVE CARBON BLACK
Merrill E. Jordan, Walpole, and John F. Hardy, Andover, Mass., assignors to Cabot Corporation, Boston, Mass., a corporation of Delaware
No Drawing. Filed Dec. 30, 1964, Ser. No. 422,432
9 Claims. (Cl. 23—209.4)

The present invention provides a method for producing high structure, conductive carbon blacks which broadly comprises a two-stage carbon forming reaction. In the first stage, a carbon black aerosol is produced by the well known furnace process, i.e., a hydrocarbon make fuel is charged into a heated zone wherein cracking or incomplete combustion thereof occurs. It is important that the carbon black aerosol effluent produced in said first stage, (1) comprise a substantial quantity of hydrocarbonaceous materials representing at least about 1% by weight of the carbon black product, and (2) have a temperature of at least about 1200° F. In the second stage of the present process, sufficient acetylene is charged into the above-described aerosol to (1) raise the temperature thereof to at least about 2250° F., and (2) provide an acetylene based carbon black product representing at least about 10% by weight of the total black product. The temperature rise realized in said second stage not only serves to produce carbon black from the acetylene charge but also to further decompose the hydrocarbon residue forming part of the first stage reaction products.

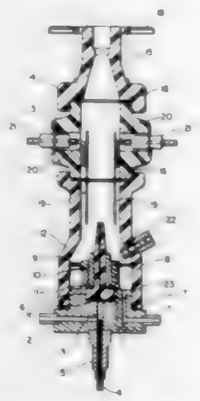
3,371,998
PROCESS FOR THE REMOVAL OF BROMINE, AIR AND CO_2 FROM SALINE WATER
William P. Schambra, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed May 6, 1965, Ser. No. 453,828
5 Claims. (Cl. 23—218)

This invention relates to a process for the removal of bromine, air and CO_2 from seawater which comprises adjusting the pH of such water with an acid to a value of 3.0–4.0, admixing chlorine with the acidified water to achieve an oxidation potential of about 0.9–1.00 volt and applying sufficient vacuum to said treated water to remove CO_2, air and bromine therefrom.

3,371,999
PURIFICATION OF BY-PRODUCT SULFUR FORMED FROM CHLORINATION PROCESSES
Adam E. Skrzec, West Nyack, N.Y., assignor to Stauffer Chemical Company, New York, N.Y., a corporation of Delaware
Filed May 25, 1965, Ser. No. 458,701
7 Claims. (Cl. 23—224)

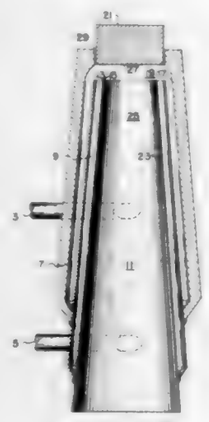
1. The method of removing iron and sulfur chlorides from the sulfur by-product formed in the manufacture of carbon tetrachloride by the chlorination of carbon disulfide which comprises passing the sulfur by-product in the form of molten droplets counter-currently through a dilute, basic aqueous medium, the temperature of which is above the melting point of sulfur whereby the iron and sulfur chlorides are extracted from the droplets, collecting the reconstituted molten sulfur after passage through the aqueous medium and allowing it to solidify.

3,372,000
FLAME IONIZATION DETECTOR
William S. Gallaway, Fullerton, and Arthur C. Seibel, Garden Grove, Calif., assignors to Beckman Instruments, Inc., a corporation of California
Filed Feb. 27, 1964, Ser. No. 347,749
6 Claims. (Cl. 23—254)



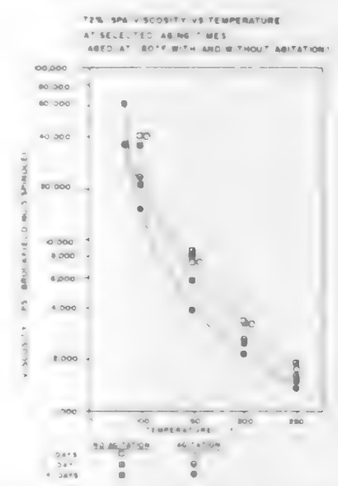
A detector is disclosed having a nonconducting jet with two parallel plate electrodes placed generally above it, in a nonconducting chamber out of contact with the flame and extending slightly below the tip of the jet and of sufficient length and area to insure substantially complete collection of both positive ions and electrons. The remainder of the parts are also of nonconducting material insofar as possible. An auxiliary ignition jet may be spaced below and to the side of the main jet. A dual burner circuit employing such a detector is illustrated.

3,372,001
APPARATUS FOR PRODUCING METAL OXIDES
Charles B. Wendell, Canton, Mass., assignor to Cabot Corporation, Boston, Mass., a corporation of Delaware
Filed Dec. 6, 1963, Ser. No. 328,693
3 Claims. (Cl. 23—277)



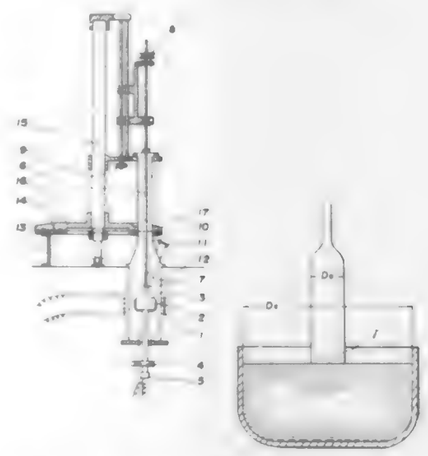
1. An improved burner comprising a laterally enclosed, internally unobstructed frusto-conical main chamber, at least two concentric frusto-conical shells positioned about and uniformly spaced from the lateral walls of said frusto-conical chamber so as to form at least two concentric annuli around said chamber along the major portion of its length beginning at the small end thereof, the space between the inner shell and the chamber being closed at the large end of said inner shell and the space between the two shells being closed at the larger end of the outer shell, while the small end of the outer shell extends beyond the small ends of both the inner shell and said chamber and then terminates in a full end closure thus defining a confined premixing space communicating directly with the small ends of the main chamber and both annuli, inlet means into each of said annuli to cause spiraling of gases introduced thereinto and means for readily adjusting the volume of said confined premixing space.

3,372,002
VISCOSITY REDUCTION OF WET PROCESS SUPERPHOSPHORIC ACID
Robert C. Mazurek and Phillip E. Hynson, Lakeland, Fla., assignors, by mesne assignments, to Armour Agricultural Chemical Company, a corporation of Delaware
Filed Dec. 2, 1965, Ser. No. 514,431
3 Claims. (Cl. 23—293)



1. In a process for reducing the viscosity of wet process superphosphoric acid having a P_2O_5 content of at least 68 weight percent, the steps of aging said acid for at least a day at a temperature in the range of about 180–220° F. while keeping the acid in a state of agitation, and thereafter allowing the acid to cool to the ambient temperature.

3,372,003
APPARATUS AND METHOD FOR PRODUCING SILICON SINGLE CRYSTALS FOR SEMICONDUCTOR
Hideo Yamase, Noda, Japan, assignor to Shin Nippon Chisso Hiryo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan
Filed July 17, 1964, Ser. No. 383,529
Claims priority, application Japan, July 19, 1963, 38/38,897
2 Claims. (Cl. 23—301)

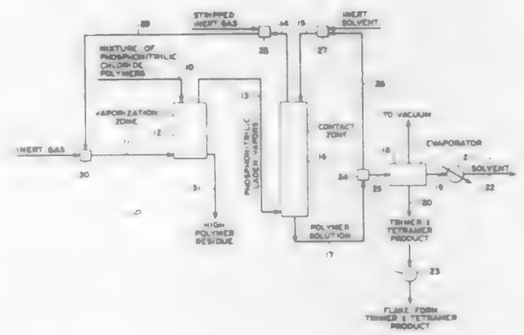


Method and apparatus for producing silicon single crystal by pulling a silicon single crystal from 10% to 60% by weight of molten silicon in a crucible charged with polycrystalline silicon in one pulling cycle, transferring a pulling apparatus together with a pulled single crystal to a single crystal detaching position while simultaneously applying another pulling apparatus to the crucible and charging polycrystalline silicon in an amount corresponding to the pulled single crystal for use of subsequent pulling cycle and repeating the operation.

3,372,004
PROCESS FOR MAKING POROUS SODIUM FLUORIDE PELLETS
Earl W. Richardson, Paducah, Ky., and Leonard E. McNeese, Oak Ridge, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission
No Drawing. Filed Mar. 23, 1966, Ser. No. 538,169
7 Claims. (Cl. 23—313)

1. A method of making a stable, porous body of sodium fluoride suitable for withstanding repeated gaseous fluoride sorption-desorption cycles, comprising the steps of mixing sodium fluoride powder with water to form a wet agglomerate, drying the agglomerate, and sintering the agglomerate by heating the latter to a temperature selected from a range of temperatures between about 1200° F. and about 1700° F. for forming the porous body.

3,372,005
PHOSPHONITRILIC CHLORIDE PURIFICATION PROCESS
Daniel J. Jaszka, Tonawanda, and John T. Rucker, Lewiston, N.Y., assignors to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York
Filed Aug. 14, 1962, Ser. No. 216,893
13 Claims. (Cl. 23—357)



4. The method for the preparation of mixtures of cyclic phosphonitrilic chloride trimer and tetramer which comprises reacting phosphorus pentachloride with ammonium chloride in the presence of a first inert solvent, said reacting being sufficient to obtain a polymer product comprising phosphonitrilic chloride trimer and tetramer, vaporizing the first inert solvent from the resulting product liquor sufficiently to obtain phosphonitrilic chloride products, heating said products to a temperature of up to about 170 degrees centigrade sufficiently to obtain said products in a molten state, passing inert gas through said molten products sufficiently to obtain said inert gas laden with trimeric and tetrameric cyclic phosphonitrilic chloride polymers, contacting the resulting polymer-laden gas with a second inert solvent sufficiently to produce a solution of cyclic phosphonitrilic chloride polymer in said second solvent, the temperature of said second solvent being less than the boiling temperature of said second solvent, and subsequently vaporizing the second solvent from the said solution sufficiently to obtain the phosphonitrilic chloride polymer crystals as a product.

3,372,006
HALOGEN DERIVATIVES OF POLYHEDRAL BORON COMPOUNDS
Bertrand L. Chamberland, Wilmington, Del., and Earl L. Muetterties, West Chester, Pa., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed May 31, 1962, Ser. No. 199,574
12 Claims. (Cl. 23—358)

1. A compound of the formula

$$M_a(B_{20}H_{18-n}X_n)_b$$

wherein M is a cation having a valence of 1–3, inclusive, and is selected from the class consisting of
hydrogen,
hydronium,
metal selected from Groups I and II of the Periodic Table having an atomic number of up to 80,
ammonium,
hydrazonium,

$[Ni(NH_3)_6]^{+2}$, $[Zn(NH_3)_4]^{+2}$
$[Co(NH_2C_2H_4NH_2)_3]^{+3}$, $[Ni(dipyridyl)_3]^{+2}$
$[Co(NH_3)_6]^{+3}$, $[Co(NH_3)_4]^{+2}$

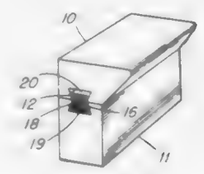
aryldiazonium of 6–10 carbon atoms,
S-substituted sulfonium,
P-substituted phosphonium,
N-substituted ammonium,
N-substituted hydrazinium
wherein the substituents on the S, P and N atoms are selected from the class consisting of alkyl, alkenyl, cycloalkyl, cycloalkenyl, aryl, aralkyl, alkaryl, cyanoalkyl and
hydroxyalkyl, wherein each of the immediately above groups contains at most 18 carbon atoms,

X is halogen, n is a positive number of 1–18, inclusive; and a and b are the smallest whole numbers which satisfy the equation

$$b = \frac{n \times \text{valence of M}}{2}$$

11. $Zn(NH_3)_4B_{20}H_{12}Cl_6$.

3,372,007
WORKPIECE ASSEMBLY
James D. Shaver, Scarsdale, N.Y., assignor to Clark & Vicario Corporation, North Tarrytown, N.Y., a corporation of New York
Filed Aug. 3, 1965, Ser. No. 476,953
5 Claims. (Cl. 29—183)



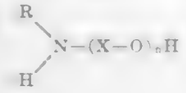
1. A workpiece assembly comprising first and second bodies arranged in surface-to-surface contact, each body having a cavity therein extending inwardly from an opening in the surface thereof, each cavity enlarging uniformly in size inwardly of said openings, said openings being juxtaposed one with the other, and a mass of a non-shrinking type metal alloy investing and partly filling each of said cavities, said metal alloy having a melting temperature in a range which is below that of said bodies.

3,372,008
METAL REFLECTOR AND METHOD OF MANUFACTURING SUCH REFLECTORS
Cornelis Korver, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed May 10, 1962, Ser. No. 194,217
Claims priority, application Netherlands, May 29, 1961, 265,287
3 Claims. (Cl. 29—183.5)

1. A metal reflector comprising a cast reflector body of aluminum and having alloys chosen from the group consisting of an alloy having 3.0% of magnesium, less than 0.6% of manganese, less than 3.0% of silicon and the remainder aluminum; an alloy having about 0.4% of manganese, from 12% to 13.5% of silicon and the remainder aluminum; an alloy having about 1.0% of magnesium, from 0.2% to 1.0% of manganese, about 5% of silicon, and the remainder aluminum; a reflecting layer of aluminum on said cast aluminum body and an oxide layer coating on said reflecting layer of aluminum.

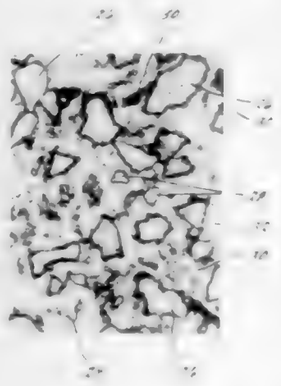
3,372,009
LIQUID FUEL COMPOSITIONS CONTAINING AS ANTI-CORROSION AGENT AN ALKYL MONO-ALKANOL AMINO COMPOUND
Hans F. Waldmann, Glassboro, N.J., assignor to Mobil Oil Corporation, a corporation of New York
No Drawing. Filed June 18, 1964, Ser. No. 376,263
9 Claims. (Cl. 44—72)

1. A liquid hydrodesulfurized hydrocarbon fuel composition normally tending to promote vapor phase corrosion, containing a liquid hydrodesulfurized hydrocarbon fuel heavier than gasoline and an effective amount of an alkyl amino mono-alkanol compound of the formula:



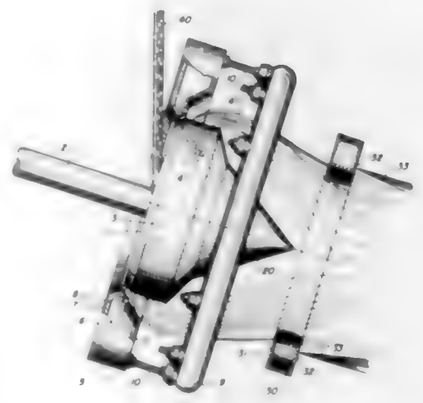
where R represents an alkyl group having from 1 to about 10 carbon atoms; X is an alkylene group having from 2 to about 4 carbon atoms; and *n* represents an integer of 1 and 2.

3,372,010
DIAMOND ABRASIVE MATRIX
Milton C. Parsons, Redford Township, Wayne County, Mich., assignor to Wall Colmonoy Corporation, Detroit, Mich., a corporation of Delaware
Filed June 23, 1965, Ser. No. 466,391
7 Claims. (Cl. 51—309)



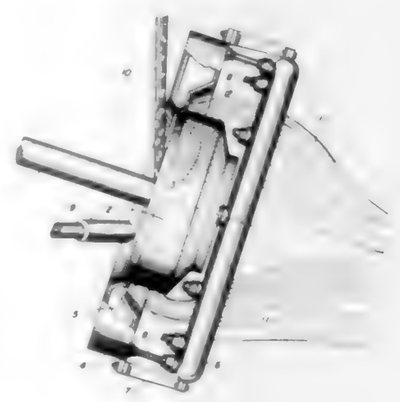
A metallic bonding matrix for diamond abrasive grains having a micro structure containing tungsten carbide and chromium boride particles bonded in a lattice comprising a solid solution of controlled amounts of nickel, iron, copper, chromium, tin, carbon, boron and silicon.

3,372,011
APPARATUS FOR FORMING FIBERS
William F. Porter, Roselle, Ill., assignor to United States Gypsum Company, a corporation of Delaware
Filed June 7, 1965, Ser. No. 461,736
3 Claims. (Cl. 65—14)



Apparatus for forming fibers comprising a rotor having orifices in its side wall, a surrounding ring burner, a streamlining cone extending downstream from the rotor, and an attenuating blast ring located donwstream from the rotor a distance equal to or greater than about ½ the diameter of the rotor. The attenuating blast ring has an inside diameter about equal to the outside diameter of the rotor, and the attenuating blast from this ring is directed axially downstream from the rotor.

3,372,012
FIBER ATTENUATING BURNER
William F. Porter, Roselle, Ill., assignor to United States Gypsum Company, a corporation of Delaware
Filed June 7, 1965, Ser. No. 461,994
3 Claims. (Cl. 65—14)

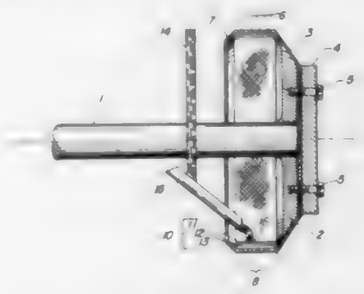


Apparatus for manufacturing fibers including a fiberizing rotor and an encircling gas burner having a combustion chamber to operate at superatmospheric pressure, with a plurality of inlets on the downstream side of the burner and radially remote from said rotor, and a refractory liner on the upstream wall of the burner opposite the inlets so that incoming pressurized gases are directed against the refractory. A gas supply manifold is spaced downstream of said burner on rigid supports and is connected to the inlets by flexible conduits which occupy a minor portion of the circumference of the manifold.

3,372,013
APPARATUS FOR FORMING FIBERS
William F. Porter, Roselle, Ill., assignor to United States Gypsum Company, a corporation of Delaware
Filed June 7, 1965, Ser. No. 461,734
8 Claims. (Cl. 65—15)

Fiberizing apparatus including a rotor having a peripheral wall with a plurality of rows of orifices, the rotor being mounted on a shaft disposed at an angle to the vertical with the inner surface of the lower portion of the wall exposed upwardly beneath the bushing of a forehearth. The melt to be fiberized falls directly from the bushing of the forehearth onto the upwardly exposed inner surface of the rotor wall, over the orifices. Additionally, a current of gas of varying intensity may be impinged on the falling stream to oscillate the stream across the width of the orifice band.

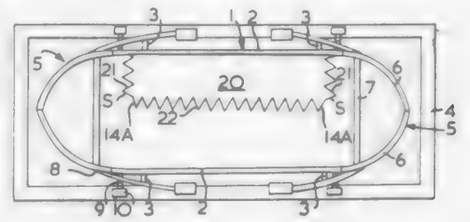
3,372,014
APPARATUS FOR FORMING FIBERS
Jack W. Garrison, Evanston, Ill., assignor to United States Gypsum Company, a corporation of Delaware
Filed June 7, 1965, Ser. No. 461,735
4 Claims. (Cl. 65—15)



Apparatus for forming fibers including a rotor with orifices through its wall and a distributor having a plurality of radially superposed foraminous layers within the rotor and contacting the wall.

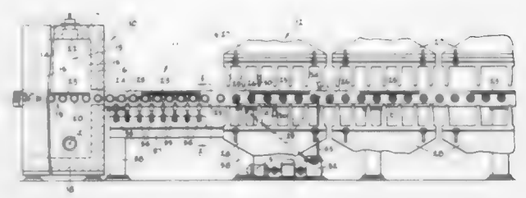
3,372,015
METHOD OF AND APPARATUS FOR EQUALIZING THE COOLING OF A GLASS SHEET SUPPORTED ON A BENDING MOLD
Ronald E. Richardson, Oshawa, Ontario, Canada, assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed May 12, 1964, Ser. No. 366,744
Claims priority, application Canada, Nov. 15, 1963, 889,119
9 Claims. (Cl. 65—103)

Apparatus and method of bending, annealing and cooling glass wherein the glass sheet is supported at its marginal edges on an outline type bending mould and conveyed through bending, cooling and annealing zones of a conventional bending lehr. A heat sink in the form of a confined, heated body of air is maintained in contact with a portion of the sheet inboard of the trailing edge of the latter thereby retarding the cooling of said sheet portion during the cooling and annealing stages and hence promoting toughening of the trailing edge of the sheet. The



body of air is confined by means of an air barrier in the form of a relatively thin metal sheet underlying at least the sheet portion mentioned above and spaced therefrom to form a confined chamber. The metal sheet is connected to the central trailing edge portion of the bending mould in a manner to prevent substantial escape of the heated air from the chamber.

3,372,016
METHOD FOR TEMPERING AND CONVEYING GLASS SHEETS
Donald D. Rahrig and Thomas B. O'Connell, Toledo, and Charles W. Ferguson, Perrysburg, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Continuation of abandoned application Ser. No. 284,585, May 31, 1963. This application July 7, 1966, Ser. No. 563,614
2 Claims. (Cl. 65—114)

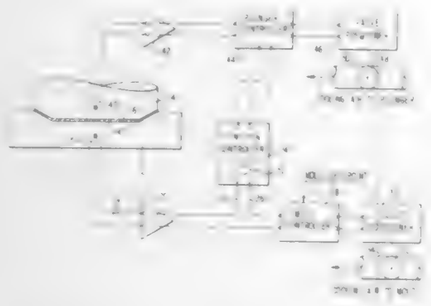


A method of tempering glass sheets wherein the sheets are conveyed along a horizontal path through a heating zone and heated to substantially the softening point of the glass and then moved out of said zone and subjected to blasts of cooling air to temper the glass, all while supported upon and in contact with a roller conveyor. The top surface of the sheet is heated to a higher temperature than the bottom surface thereof as the sheet passes through the heating zone to bow the sheet upwardly. As the sheet leaves the heating zone, the bottom surface only is subsequently heated to equalize the temperatures in the sheet and remove the bow, and simultaneously with such subsequent heating a gaseous medium is applied to the bottom surface only of the sheet to increase the resistance thereof to breakage.

3,372,017
AUTOMATIC TEMPERATURE CONTROL FOR GLASS MOLDING PROCESS
Richard B. Pitbladdo, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Jan. 7, 1965, Ser. No. 424,107
3 Claims. (Cl. 65—162)

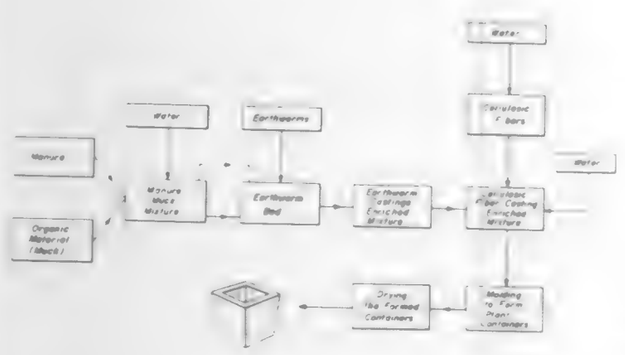
A method and apparatus for automatically controlling the mold and plunger temperatures in a free glass pressing

process so that the glassware does not stick to the plunger when the plunger is removed from the mold. The mold temperature is controlled to maintain it within a desired operating range, and the plunger temperature is controlled as a function of the mold temperature to maintain the



plunger temperature at a desired value lower than the mold temperature so that the glassware does not stick to the plunger. The process function which determines the relative plunger temperature may be changed by an adjustable function controller to match the process to the characteristics of the particular article being molded.

3,372,018
METHOD OF PRODUCING NUTRIENT-CONTAINING PLANT CONTAINERS
Donald D. Stocker, Hallandale, Fla. (Box 732, Russell Point, Ohio 43348), and Frank E. Stocker, Lakeview, Ohio (6960 NW. 27th St., Hollywood, Fla. 33024)
Filed Feb. 2, 1966, Ser. No. 524,591
4 Claims. (Cl. 71—21)



1. The method of producing a formed self-sustaining nutrient containing plant container characterized by a high wet-strength which comprises:

(a) moistening a mixture of about 50% by volume of cow manure and 50% by volume of muck with sufficient water to permit thoroughly blending the mixture;

(b) subjecting the blended mixture to the action of earthworms for a period of about three to seven days to permit enrichment of the mixture with castings produced by the worms;

(c) covering the worm casting enriched mixture with a layer of a fresh mixture prepared as in (a);

(d) saturating the top layer of fresh mixture with sufficient water to cause earthworms to migrate from worm casting rich lower layer to the top layer of fresh mixture, and removing the worm laden fresh top layer to expose the worm casting enriched lower layer;

(e) admixing on the basis of volume about 50% of the worm casting enriched mixture with 50% cellulosic material such as obtained from disintegrated moist newsprint stock and plasticizing the mixture with sufficient water to permit molding the mixture;

(f) molding the plasticized worm casting-cellulosic fiber mixture into plant receiving containers;

(g) thoroughly drying the moist plant receiving containers to render them self-sustaining and inactivate substantially all viable earthworms which may be present in the formed containers.

3,372,019
SLOW-RELEASE COATING COMPOSITION CONSISTING OF WAX AND ETHYLENE VINYL-ACETATE
Richard C. Fox, San Rafael, Calif., assignor to Chevron Research Company, a corporation of Delaware
No Drawing. Filed Sept. 28, 1964, Ser. No. 399,855
3 Claims. (Cl. 71—64)

1. As a slow-release material, a water-soluble particulate body having a uniformly distributed coating on said body comprising a mixture of from 25 to 95% by weight of a wax and from 5 to 75% by weight of a copolymer of ethylene and vinyl acetate, and wherein said coating comprises from 2 to 25% by weight of said material.

3,372,020
PROCESS FOR MAINTAINING THE GROWTH OF PLANTS
Joseph Regenstein, Jr., Chicago, Ill., assignor to Velsicol Chemical Corporation, Chicago, Ill., a corporation of Illinois
No Drawing. Continuation-in-part of application Ser. No. 343,224, Feb. 7, 1964. This application Nov. 7, 1966, Ser. No. 592,327
4 Claims. (Cl. 71—85)

A process for maintaining the growth of plants which comprises applying thereto a discontinuous film of thermoplastic, petroleum-derived, inelastic, nonrubbery hydrocarbon resin having a softening point of from about 50 to about 200° F., a mixed aniline point of from about 20 to about 80° C., an iodine number of from about 70 to about 300, and a molecular weight of from about 300 to about 1400 as determined by cryoscopic means, by applying to the said plants a predominantly aqueous, resin-in-water emulsion of said resin containing from about 1 to about 15% by weight of the resin in an amount leaving the said discontinuous film upon separation of the resin from the water.

3,372,021
TUNGSTEN ADDITION AGENT
Edward C. Forbes, deceased, late of Lewiston, N.Y., by Marjorie I. Forbes, executrix, Lewiston, Daniel H. Barbour, Niagara Falls, and Charles M. Brown, Lewiston, N.Y., assignors to Union Carbide Corporation, a corporation of New York
No Drawing. Filed June 19, 1964, Ser. No. 376,550
5 Claims. (Cl. 75—.5)

1. As an alloy addition agent, a pressed mixture of elemental tungsten powder and elemental iron powder consisting essentially of about 50 to 80% tungsten and about 20 to 50% iron having a density between 50 and 75% of the theoretical density of the mixture and characterized by having an iron matrix in which the tungsten powder particles, in substantially their original size and shape, are embedded, the original particle sizing of the iron powder being substantially from about 48 to 200 mesh and the original sizing of the tungsten powder being substantially 10 to 50 microns.

3,372,022
PROCESS FOR ALLOYING METALLIC MELTS
Hans Guntermann, Essen-Steele, and Walter Bungardt, Essen, Germany, assignors to Elektro-Thermit G.m.b.H., Essen, Germany, a corporation of Germany
No Drawing. Filed Feb. 4, 1966, Ser. No. 525,148
Claims priority, application Germany, Feb. 27, 1965, E 28,782
8 Claims. (Cl. 75—27)

1. A process for preparing an alloyed metallic melt which comprises melting at least one alloying material with an exothermically-reacting mass and adding the molten material to the melt.

3,372,023
METHOD OF MONITORING AND CONTROLLING THE OXYGEN BLOWING PROCESS
Helmut Krainer and Jurgen Maatsch, Essen, Germany, assignors to Beteiligungs und Patentverwaltungsgesellschaft mit beschrankter Haftung, Essen, Germany, a corporation of Germany
Filed May 18, 1965, Ser. No. 456,713
Claims priority, application Germany, May 23, 1964, B 76,907
3 Claims. (Cl. 75—60)

1. A method of monitoring and controlling automatically the reactions occurring during the oxygen blowing process between the metal bath, the slag and the gas phase, comprising the steps of measuring continuously the amount of oxygen blown onto the metal bath per time unit and the volume of the waste gas and analyzing said waste gas for CO, CO_2, O_2 and H_2, transmitting said measured and composition values for computation and obtaining a value $\dot{O}_c$, characteristic for the distribution of oxygen in the occurring reactions according to the equation

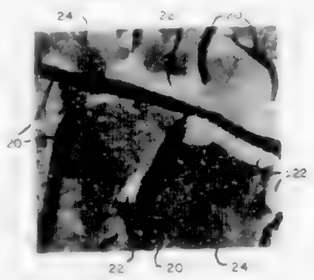
$$\dot{O}_c = \frac{1}{100}\cdot\frac{\dot{V}}{d\dot{O}_B/dt}\,[0.766\cdot CO + 1.266(CO_2+O_2) - 0.234H_2 - 26.82]$$

and controlling the course of the reactions by controlling the O_c=value, including controlling the amount of oxygen blown onto said metal bath, and the distance of the oxygen nozzle from said metal bath and the feeding of additives, respectively, wherein $\dot{O}_c$ denotes the ratio of the oxygen amount bound in the carbon of the metal bath per unit of time to the amount of oxygen blown in per unit of time, $d\dot{O}_B/dt$ denotes the amount of oxygen blown in per unit of time, $\dot{V}$ denotes the flow rate of dry waste gases converted to standard conditions, and CO, CO_2, O_2 and H_2 denote the volumetric percentage values of carbon monoxide, carbon dioxide, oxygen and hydrogen, respectively, contained in the dry exhaust gases within the gas exhaust system of a reaction vessel.

3,372,024
ZONE REFINEMENT OF LIQUID-PHASE SINTERED TUNGSTEN ALLOYS
Niranjan M. Parikh, Chicago, Ill., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Army
No Drawing. Filed Nov. 10, 1966, Ser. No. 594,317
4 Claims. (Cl. 75—84)

This process is a treatment of a sintered tungsten alloy for a matrix which utilizes zone refining for the removal of the low melting matrix while depositing therefrom the contained tungsten on the sintered tungsten for the production of practically pure tungsten.

3,372,025
METALLURGICAL PROCESS
John F. Wallace, Shaker Heights, Ohio, and Robert W. Newyear, Latrobe, Pa., assignors to Vulcan Mold and Iron Company, Latrobe, Pa., a corporation of Pennsylvania
Filed Nov. 17, 1964, Ser. No. 411,780
3 Claims. (Cl. 75—123)

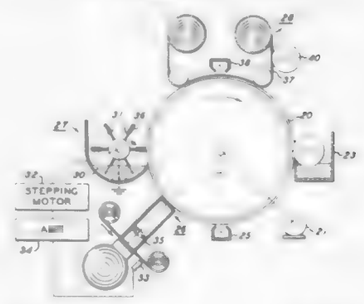


A method of altering the composition and microstructure of cupola melted gray iron by introducing anthracite coal. The anthracite coal increases the length of the graphite flakes. The pearlite in the matrix is reduced, the eutectic cell count of the structure is reduced, and the amount of ferrite in the matrix of the iron is increased.

3,372,026
HOT ROLLING NICKEL SILVER ALLOY
Richard J. Christine, Waterbury, Conn., assignor to Anaconda American Brass Company, a corporation of Connecticut
No Drawing. Filed Sept. 8, 1965, Ser. No. 485,954
4 Claims. (Cl. 75—157.5)

A nickel silver alloy possessing improved hot working properties consisting essentially of 7–30% Ni, 5–43% Zn, 0.003–0.3% Ti and the balance Cu present in the range of 45–75%.

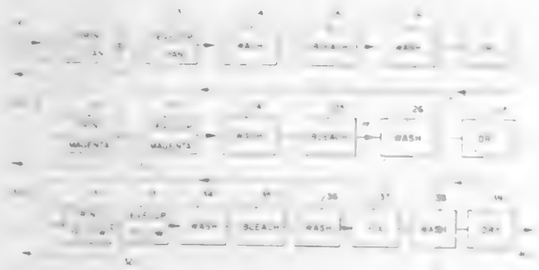
3,372,027
XEROGRAPHIC LIQUID DEVELOPMENT
Robert W. Gundlach, Victor, and Peter P. Augostini, Webster, N.Y., assignors to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed May 15, 1964, Ser. No. 367,776
10 Claims. (Cl. 96—1)



Latent electrostatic images are developed by applying a homogeneous liquid having a bulk resistivity in the

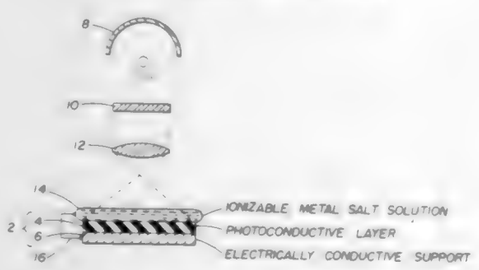
range of 5×10^4 ohms-cms. to 10^{14} ohms-cms. to the edge of a non-porous blade and wiping the edge of the blade across the latent electrostatic images.

3,372,028
COLOR PROCESS UTILIZING A SINGLE LAYER SILVER HALIDE EMULSION
Leo J. Nicastro, Los Angeles, Calif., assignor to Panacolor, Inc., Hollywood, Calif., a corporation of Delaware
Continuation of application Ser. No. 250,990, Jan. 10, 1963, which is a continuation-in-part of applications Ser. No. 81,751 and Ser. No. 81,752, Jan. 10, 1961. This application Sept. 14, 1967, Ser. No. 667,810
7 Claims. (Cl. 96—4)



This invention relates to an improved process for making photographic prints in natural color, and it is particularly directed to a process in which positive film stock having a single layer silver halide emulsion is exposed through one of three color separation negatives. There are no color couplers present in this single layer. These color separation negatives are extracted by conventional means and are black and white in form. The exposed film strip is then color developed to produce the first color which may comprise cyan, and is then chemically treated with a bleach to eliminate any latent image remaining after the first exposure and development steps. The film strip is then re-exposed through a second color separation negative, color developed and processed in a similar manner, this time producing the color magenta. The film strip is exposed for the third time using the third color separation negative, and is then color developed and processed as before to produce the yellow color. The printing apparatus in which the exposures are made is designed to maintain accurate registration. If desired, the film strip may be exposed prior to the last color development step to produce one or more sound tracks. After washing, fixing and drying, the film strip then comprises a full color print.

3,372,029
PROCESS FOR DEVELOPING PHOTOCONDUCTIVITY IMAGES IN ZINC OXIDE PHOTOCONDUCTIVE LAYERS
Nelson R. Nail, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Oct. 29, 1964, Ser. No. 407,371
4 Claims. (Cl. 96—48)



A process for forming images on a photoconductive sheet characterized by the steps of imagewise exposing a photoconductive zinc oxide layer carried on an electrically conductive support, contacting the layer, while the exposed areas are electrically conductive, with a solution containing an ionizable soluble metal salt, and providing a direct electrical connection which bypasses the zinc oxide layer and connects the solution and the support. The process is conducted in the absence of an externally applied electric field.

3,372,030
METHOD OF SHORTENING THE PROCESSING TIME OF COLOR PHOTOGRAPHY
Kurt Israel Jacobson, Epsom, England, assignor to The Pavelle Corporation, White Plains, N.Y., a corporation of New York
No Drawing. Filed Dec. 14, 1962, Ser. No. 244,561
1 Claim. (Cl. 96—55)

1. A method of shortening the processing time of color photographic sensitive material which comprises, providing a multi-layer emulsion-coated photographic material in which each layer incorporates closely spaced finely dispersed coupler and silver halide particles in a photographic dispersion medium, each emulsion layer being of the order of 2 microns in thickness, the ratio of silver to dispersion medium is substantially 1:1, the ratio of coupler to dispersion medium being substantially 1:3; exposing the material to form a latent image; converting the latent image to a visible image by subjecting the exposed material for a brief period at a temperature of between about 20° C. and 35° C. to the action of a highly alkaline aqueous solution of a developer selected from the group consisting of N-diethyl-p-phenylene diamine and substituted, more soluble derivatives thereof; immediately immersing the developed material for a brief period in a bleach-fix bath comprising an acid solution of a silver halide solvent and an acid-stable ferric salt of an alkylene amine polyacetic acid and then washing and drying the thus processed material.

3,372,031
DIRECT POSITIVE SILVER HALIDE ELEMENT WITH CONTIGUOUS COLLOID LAYER CONTAINING DEVELOPING AGENT
John Harold Baylis and Edward Cyril Dodd, Ilford, Essex, England, assignors to Ilford Limited, Essex, England, a British company
No Drawing. Filed July 30, 1964, Ser. No. 386,391
Claims priority, application Great Britain, Aug. 28, 1963, 34,090/63
6 Claims. (Cl. 96—76)

There is provided a process for the production of a photographic material. On a support, such as paper or the the like, is deposited a layer of a direct positive emulsion which is a fogged gelatino silver halide emulsion containing at least 95 mole percent of silver chloride and a desensitising agent effective to sensitise the Herschel effect to produce direct positive characteristics. When the emulsion is fully dried, a layer of a water permeable colloid and a developing agent for the emulsion is deposited and dried in less than 50 seconds. Alternately a thin water-permeable layer may be placed between the emulsion and developer layers.

3,372,032
PREPARATION OF A DRY MIXTURE OF STARCH HYDROLYSATE AND VEGETABLE MEAL
Marcel L. E. van Tittelboom, Sas Van Gent, Netherlands, assignor to Corn Products Company, New York, N.Y., a corporation of Delaware
No Drawing. Filed Dec. 30, 1964, Ser. No. 422,419
Claims priority, application Netherlands, Jan. 10, 1964, 64—146
4 Claims. (Cl. 99—2)

1. A process for preparing a dry, powdered product suitable for feeding animals which comprises intimately mixing about 50 to 60 percent, dry basis, of a starch hydrolysate liquor with vegetable protein meal to form a sticky mass having a moisture content not in excess of 13 percent, maintaining the temperature of said mixture at about 30 to 50° C. while slowly agitating the mixture until a dry, powdered product is obtained; said starch hydrolysate liquor having a D. E. value of at least 75 percent and a dextrose content of at least 50 percent and a solids content sufficient to permit crystallization of the dextrose therein at said temperature; said vegetable protein meal containing not more than 10 percent of oil.

3,372,033
RETINYLYDENE CYANO-ACETIC ACID, ESTERS AND SALTS THEREOF, AS AN EGG YOLK COLORANT EMPLOYED IN POULTRY FEED
Pieter Henri van Leeuwen, Van Houtenlaan, Weesp, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
No Drawing. Original application Oct. 3, 1962, Ser. No. 228,126. Divided and this application Feb. 8, 1965, Ser. No. 438,148
Claims priority, application Netherlands, Oct. 16, 1961, 270,292
4 Claims. (Cl. 99—4)

1. A poultry feed preparation comprising at least one poultry feed ingredient and a compound selected from the group consisting of retinylydene cyanoacetic acid, esters of said acid and salts of said acid with alkali metals and alkaline earth metals.

3,372,034
STARCH COMPOSITIONS AND IMPROVEMENT OF FOOD WITH SAME
John J. Magic, Markham, Ill., and Robert F. Frost, Griffith, Ind., assignors to American Maize-Products Company, a corporation of Maine
No Drawing. Filed Mar. 26, 1963, Ser. No. 267,954
16 Claims. (Cl. 99—83)

1. A composition particularly suitable for improving fat-containing foods which comprises starch and in admixture therewith at least about 0.1% based on the weight of said starch of particles of a synthetic compound containing oxides of sodium (Na_2O), aluminum (Al_2O_3) and silicon (SiO_2) in the proportions of about 0.8 to 1.3 moles Na_2O for each mol of Al_2O_3 and about 4 to 16 moles SiO_2 for each mol of Na_2O, substantially all of said particles being less than one micron in diameter.

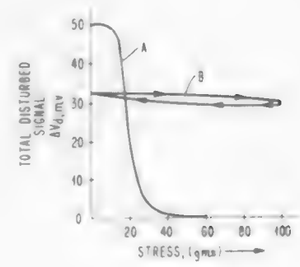
3,372,035
STABILIZED ICE CREAM COMPOSITIONS
Charles R. W. Morison, Ossining, N.Y., and Rosemary E. Weisse, Danbury, Conn., assignors to Union Carbide Corporation, a corporation of New York
No Drawing. Filed Aug. 14, 1964, Ser. No. 389,103
4 Claims. (Cl. 99—136)

Frozen milk products such as ice cream are stabilized by incorporation therein of a small amount of water soluble hydroxyethyl cellulose. The hydroxyethyl cellulose serves to impart good whipping characteristics and to prevent ice crystal growth and the resulting stabilized product possesses adequate body, smooth texture, and a long storage life.

3,372,036
FOOD ANTIOXIDANTS
Robert W. Eltz, Media, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Filed Sept. 1, 1964, Ser. No. 393,730
14 Claims. (Cl. 99—150)

The specification discloses a process for stabilizing a foodstuff against oxidative deterioration. The specification also discloses a foodstuff composition containing an inhibitor against such deterioration. The process comprises incorporating into the fodstuff an inhibitor selected from the group consisting of the 2,3-enediols of 3-ketoglycosides and the higher fatty acid esters thereof. The inhibitor is a compound selected from the group consisting of 2,3-enediols of 3-ketomaltose, 3-ketosucrose, 3-ketolactose, 3-ketomaltobionic acid and 3-ketolactobionic acid and the fatty acid esters thereof.

3,372,037
MAGNETIC MATERIALS
Richard S. McGrath, Hopewell Junction, and Norman W. Silcox, Poughkeepsie, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y., a corporation of New York
Filed June 30, 1965, Ser. No. 468,355
10 Claims. (Cl. 106—1)



A process and plating bath for electrolessly plating a nickel-iron magnetic material comprising nickel ions, hypophosphite ions, hydroxyl ions and ferric ions.

3,372,038
SILICATE COATINGS
Helmut Hans Wilhelm Weldes, Havertown, and David I. Netting, Swarthmore, Pa., assignors to Philadelphia Quartz Company, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Continuation-in-part of application Ser. No. 311,215, Sept. 24, 1963. This application Aug. 18, 1964, Ser. No. 390,447
9 Claims. (Cl. 106—1)

1. A corrosion resistant coating composition for metal consisting essentially of:

(a) an aqueous solution of an organic ammonium silicate which is characterized by the formula

$$X(N_nR_p^s)_2O \cdot YSiO_2 \cdot ZH_2O$$

wherein:

N represents a nitrogen atom; n is a small integer less than 10 and preferably less than 5; X, Y, and Z represent numbers defining the relative amounts of each of the component parts of the compound, and more specifically, X is 1, Y is preferably between 0.5 and 50, and Z is preferably between 0 and 99; R represents alkyl radicals containing between 1 and 20 carbon atoms, at least one of which is an omega hydroxy alkyl group; up to four R groups being associated with each N;

p is at least 4, indicating total bonds of R groups to N; and

s is an integer from 1 to p, indicating the number of different types of R groups,

(b) a finely divided zinc powder in the amount of between about 6 to 20 grams of zinc powder per gram of SiO_2.

3,372,039

FLUOROACID AND ZIRCONIUM OXYHALIDE COMPOSITIONS AND MATERIALS TREATED THEREWITH

Domenick Donald Gagliardi, East Greenwich, R.I., assignor to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Apr. 27, 1964, Ser. No. 362,996
19 Claims. (Cl. 106—2)

Water, oil, strain and soil repellency are obtained on textiles and similar materials by treating them with an aqueous composition containing zirconium oxyhalide and a highly fluorinated carboxylic acid of from 3 to 17 carbon atoms and preferably one of from 7 to 17 carbon atoms having at least 70% of the hydrogen atoms replaced by fluorine atoms.

3,372,040

FIRE-RESISTANT CEMENTITIOUS PLASTER COMPOSITION

Frank Ware, 12092 Chillicothe Road, Chesterland, Ohio 44026

Filed Nov. 20, 1962, Ser. No. 238,861
1 Claim. (Cl. 106—15)

1. A fire-resistant plaster composition consisting essentially of (1) portland cement, (2) about 10–50% by weight of a natural-occurring phosphate rock having 0.25 to 40% by weight of P_2O_5 and a particle size ranging from about 10–350 mesh, (3) 2–12% by weight of lime, (4) 0 to 50% by weight of an exfoliated material selected from the group consisting of vermiculite, perlite, and mixtures thereof, (5) 0 to 2.0% by weight of an adhesive-binder, (6) and 0 to 1.0% by weight of a surface-active agent.

3,372,041

PROCESS FOR PRODUCING INKS

Rollins E. Dobbin and Curt B. Beck, Pampa, Tex., assignors to Cabot Corporation, Boston, Mass., a corporation of Delaware

Application Jan. 18, 1965, Ser. No. 426,314, now Patent No. 3,294,567, which is a continuation of application Ser. No. 162,423, Dec. 27, 1961. Divided and this application June 4, 1965, Ser. No. 461,289
6 Claims. (Cl. 106—20)

The present invention relates to the production of improved newsinks. Broadly, the instant process is accomplished by dispersing into a newsink vehicle an oil or oil/water emulsion pelleted carbon black from which the finest 5 to 20 weight percent fraction has been removed. The newsinks resulting from the practice of the process contain exceptionally low residue concentrations.

3,372,042

HOT TOP AND COMPOSITION THEREOF

John C. Wright, Euclid, Ohio, assignor to Columbiana Incorporated, a corporation of Ohio

No Drawing. Filed June 15, 1965, Ser. No. 464,185
2 Claims. (Cl. 106—38.3)

This invention is in a refractory-combustible hot top composition including an organic fibrous material, sodium silicate and a fused lightweight aluminum silicate containing aggregate in which all of the volatile gases have been driven off.

3,372,043

SPRAY DRIED CLAY PRODUCT AND METHOD FOR PRODUCING THE SAME

John R. Fanselow, Plainfield, N.J., assignor, by mesne assignments, to Engelhard Minerals & Chemicals Corporation, Edison, N.J., a corporation of Delaware

No Drawing. Filed Feb. 21, 1966, Ser. No. 528,800
10 Claims. (Cl. 106—72)

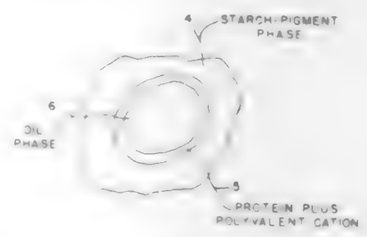
A coarse size fraction of predispersed kaolin clay pigment for paper filler use is obtained by spray drying a dispersed aqueous slip of the kaolin clay in the presence of a small amount of added colloidal clay, preferably colloidal attapulgite clay. The spray dried microspheres are less fragile as a result of the presence of colloidal clay additive and maintain desirable flow properties during handling and use.

3,372,044

METHOD AND COMPOSITION FOR FORMING PAPER HAVING OPAQUE CELLULAR STRUCTURE

Robert E. Weber, Neenah, Wis., assignor to Kimberly-Clark Corporation, Neenah, Wis., a corporation of Delaware

Filed June 30, 1964, Ser. No. 379,209
6 Claims. (Cl. 106—130)



A coating composition for paper of the oil-in-water type. The continuous phase of the emulsion includes pigment and a starch binder. The disperse phase is an oil having a lower vapor pressure than water. The composition has as the emulsifier a protein. The aqueous phase is substantially free of protein. The composition includes polyvalent metallic cations which tend to concentrate in and serve as a hardening agent for the protein in the product. The product, that is the composition, when coated on paper and heated to drive off the liquids of the composition, is a surface finish coating having voids due to oil evolution, the voids having the walls thereof of protein and hardened by the cation action to minimize sensitivity to water.

3,372,045

ASPHALT COMPOSITIONS AND PROCESS FOR PREPARING SAME

Lester A. H. Baum, Cherry Hill, N.J., and Leonard Henschel, Flushing, N.Y., assignors to Mobil Oil Corporation, a corporation of New York

No Drawing. Filed Oct. 4, 1963, Ser. No. 313,758
10 Claims. (Cl. 106—279)

1. A process for preparing a heat-stable thermal asphalt which comprises:

blending a resinous pitch material deficient in high-boiling aromatic oils and having a softening point (R. & B.) from about 75° F. to about 140° F., a specific gravity at 77° F. from about 1.0 to about 1.3 and a Conradson carbon number from about 25 to 45%, with

a liquid furfural extract containing at least about 50% by weight of high-boiling aromatic oils, and having a viscosity at 210° F. SUS from about 40 to about 500; an A.P.I. gravity at 60° F. from about 5.0 to about 20; a flash point from about 300° F. to about 625° F.; and a pour point of at least 20° F.; and

distilling the resulting blend to produce a heatstable thermal asphalt having a softening point (R. & B.) from about 150° F. to about 270° F.

3,372,046

SILICA PIGMENTS AND PROCESS FOR PRODUCING SAME

Oliver W. Burke, Jr., 506 Intracoastal Drive, Fort Lauderdale, Fla. 33306

Filed May 24, 1965, Ser. No. 458,132
20 Claims. (Cl. 106—288)

1. A silica pigment which has been prepared by contacting an aqueous solution of alkali metal silicate having a temperature of 80±10° C. with dilute carbon dioxide having a temperature in excess of 374° C. derived from a hydrocarbon rich flame, said pigment containing constituents derived from the cracking of hydrocarbon in the hydrocarbon rich flame and retained by the pigment during filtering and washing.

3. In a process for preparing a silica pigment which includes the steps of

(a) mixing an aqueous alkali metal silicate solution and carbon dioxide to form a slurry of wet silica pigment, the improvement which consists in:

(b) conducting at least the latter part of the mixing in step (a) at least in part by introducing hot gaseous combustion products of hydrocarbon comprising carbon dioxide into the solution at a temperature in excess of 374° C.

3,372,047

COLOR STABILIZED MICA

Howard Richard Linton, Scotch Plains, and Edward F. Klenke, Jr., Liberty Corner, N.J., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed Oct. 11, 1965, Ser. No. 494,395
9 Claims. (Cl. 106—291)

Stabilization of mica to inhibit discoloration on subjection of the mica to calcination at 600–1000° C. or on employment as a substrate in nacreous pigment manufacture in which the mica is coated with a metal oxide (TiO_2, ZrO_2, Fe_2O_3, etc.), such stabilization being effected by directly mixing the mica prior to calcination with from 1–50% and preferably from 5–10%, by weight, calculated as Al_2O_3, of an aluminum compound (an oxide, silicate, sulfate, and halide).

3,372,048

PROCESS FOR THE COLOR RESTORATION OF FADED TEXTILE MATERIALS AND ARTICLES PRODUCED THEREBY

Leonard Weissbein, Basking Ridge, N.J., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed July 31, 1963, Ser. No. 299,094
11 Claims. (Cl. 117—2)

1. A process for the restoration of the color of a faded, dyed, substantially opaque fibrous textile material which comprises applying to the surface fibers of said faded material a solution of an organic polymeric film forming material, which solution wets the surface fibers and transparentizes the faded fibers to thereby expose unfaded color of the fibers beneath the surface of the faded textile, and drying to yield a textile material coated with from about 1% to about 10% of the weight of said textile material of a permanent, transparent, colorless, organic film having an index of refraction similar to that of the textile fibers.

3,372,049

POLYOLEFIN FILM COMPOSITION, FILM, AND PRESSURE-SENSITIVE ADHESIVE SHEET MATERIAL

Albert N. Schaffhausen, St. Paul, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

No Drawing. Filed Oct. 9, 1961, Ser. No. 143,546
6 Claims. (Cl. 117—7)

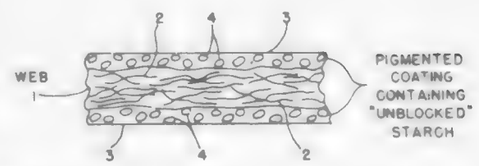
1. A poly-mono-alpha-olefinic composition which can be formed into a sheet capable of biaxial orientation to a uniform thickness of at least about 1 mil and to a tensile strength of substantially more than 6,000 p.s.i. in mutually perpendicular directions, comprising a uniform physical blend, solid at room temperature, of polymers consisting essentially of from about 50% to about 75% predominantly crystalline isotactic polypropylene having an average molecular weight of at least 250,000 and correspondingly from about 50% to about 25% of at least one separately prepared predominantly crystalline poly-mono-alpha-olefinic homopolymer other than polypropylene.

3,372,050

PAPER COATING COMPOSITION AND METHOD OF COATING

Robert E. Weber, 518 Hayleh St., Neenah, Wis. 54956

Continuation-in-part of application Ser. No. 254,965, Jan. 30, 1963. This application Feb. 7, 1966, Ser. No. 525,762
8 Claims. (Cl. 117—64)



Stable printing paper coating compositions and a process of coating paper with the compositions; the compositions are aqueous emulsions characterized by starch as constituting the only essential binder of the paper coating composition. The starch is in the aqueous phase and the emulsion contains an oil of lower vapor pressure than water in the disperse phase as well as an emulsifying agent which is of a molecular structure to inhibit the formation of a channel complex which would adversely affect starch binding strength. In the practice of the process the composition is heated on the paper and successive volatilization of water and oil result in a cellular coating. The cellular structure is produced rapidly and accepts supercalendering action without collapse. The coated paper product has an excellent pick resistance and is suitable for letterpress printing.

3,372,051

METHOD OF PREPARING METAL OXIDE-METAL SULFIDE PLURAL COATED SILICEOUS FIBERS

Charles J. Stalego, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware

No Drawing. Filed Oct. 28, 1963, Ser. No. 319,552
10 Claims. (Cl. 117—69)

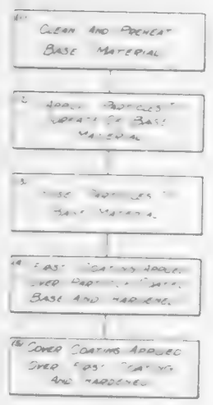
Siliceous fibers are provided with a porous metal base coating consisting of the oxides of chromium, zirconium, aluminum, titanium, cobalt and/or iron, formed by the hydrolysis and subsequent thermal dehydration of from 5–25% by weight of the combined weight of substrate and coating, of a water soluble metal salt wherein the base coating is subsequently impregnated with a different water soluble metal salt, or combination of salts, reacted with a sulfide yielding compound to form, in situ, the sulfides of these different metals consisting of barium, silver, lead,

cadmium, lithium and/or zinc. High temperature and abrasion resistant siliceous fibers are disclosed for use in high temperature applications, wherein said lubricious coating, as it is worn away, replenished from its reservoir in the porous metal base coating.

3,372,052
WATER REPELLENT FOR MASONRY
Matt C. Polniaszek, Lancaster, N.Y., assignor to Union Carbide Corporation, a corporation of New York
No Drawing. Filed Dec. 24, 1964, Ser. No. 421,092
30 Claims. (Cl. 117—72)

A water repellent for masonry comprising (1) a liquid diluent such as watur, (2) a water soluble fluosilicate, and (3) a polysiloxane.

3,372,053
COATING PROCESS
Daniel N. McCarthy, Lancaster, Ohio, assignor to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware
Filed July 22, 1963, Ser. No. 296,625
3 Claims. (Cl. 117—70)



1. The method of firmly attaching coatings of polytetrafluoroethylene to the interior smooth surfaces of glass cooking vessels which comprises the steps of bringing the vessels to a uniform temperature from between room temperature and about 100° F., mixing glass frit particles with a temporary tacky binder, spraying the frit particles generally uniformly over said surfaces of the vessels with the frit particle spacing being less than about one frit diameter, heating the vessels and frit for driving off the binder and fusing the surfaces only of the frit particles and bringing said surfaces of the vessels to a temperature near its fusing temperature, thereafter lowering the temperature of said vessel and frit surfaces whereby the particles are adhered to one another and form irregular and roughened layers on said surfaces of the vessels, applying a liquid dispersion of polytetrafluoroethylene of sufficient depth to form a first coating covering said layer on each of said vessels, hardening said coating, applying a more viscous liquid dispersion of polytetrafluoroethylene to form a thicker final coating on each of said vessels, and hardening said final coating.

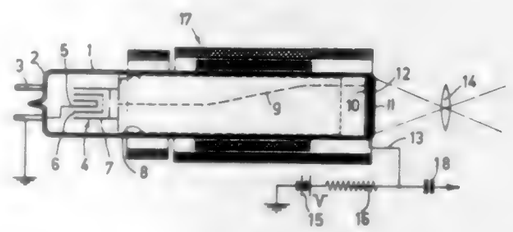
3,372,054
METHOD OF FLAME SPRAYING AND POWDER
Frederick T. Wishnie, Seaford, and Daniel P. Tanzman, Far Rockaway, N.Y., assignors to Eutectic Welding Alloys Corporation, Flushing, N.Y., a corporation of New York
No Drawing. Filed Oct. 27, 1964, Ser. No. 411,963
11 Claims. (Cl. 117—105.2)

1. A method of flame spraying metal powders that minimizes the effect of particle size distribution and configuration and any tendency of the powder composition to volatilize comprising the selection of a metal powder composition having a melting temperature ranging approximately from 360° F. to 2200° F., maintaining the particle size of said powder less than 40 mesh and approximately 75–100% by weight thereof approximately from −60 to +100 mesh, preheating said metal surface approximately to its bonding temperature with said heated metal powders whereby coalescence therewith is achieved, and flame spraying said powdered metal upon said metal surface within an oxy-fuel gas flame to plasticize said powdered metal without volatilizing it and to impinge it upon said preheated metal surface whereby it coalesces and bonds therewith to form a smooth continuous coating upon said metal surface.

3,372,055
CATALYTIC CHROMIUM PLATING PROCESS EMPLOYING BIS(ARENE)CHROMIUM
Frank P. Macfarlane, Jr., St. Albans, and Bernard I. Pesetsky, South Charleston, W. Va., assignors to Union Carbide Corporation, a corporation of New York
No Drawing. Filed May 18, 1965, Ser. No. 456,805
15 Claims. (Cl. 117—107.2)

1. A process for producing a chromium plate on a platable solid substrate in an inert atmosphere, which process comprises contacting said substrate over the area to be plated with (a) a bis(arene)chromium compound of the formula $(Ar)_2Cr$ wherein Ar designates an organic hydrocarbon selected from the group consisting of aromatic hydrocarbons containing an isolated benzene ring and aryl-substituted benzenes, in mutual contact with (b) a catalytic amount of a sulfur-containing catalyst selected from the group consisting of elemental sulfur and sulfur compounds wherein the substituents attached to the sulfur atom are composed of atoms selected from the group consisting of carbon, hydrogen, oxygen, nitrogen and halogen, said catalyst being present in an amount sufficient to catalyze the thermal decomposition of said bis(arene)chromium compound, and heating said bis(arene)chromium compound and said catalyst in contact with said substrate at a temperature of at least the decomposition temperature of said bis(arene)chromium compound in contact with said catalyst and below about 330° C., thereby producing a chromium plate on said substrate.

3,372,056
METHOD OF MANUFACTURING A PHOTORESPONSIVE DEVICE COMPRISING A PHOTORESPONSIVE PbO LAYER
Edward Fokko de Haan, Paulus Philippus Maria Schampers, and Johannes Hendrikus Nicolaas van Vucht, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Mar. 10, 1964, Ser. No. 350,713
Claims priority, application Netherlands, Mar. 12, 1963, 290.119
30 Claims. (Cl. 117—200)

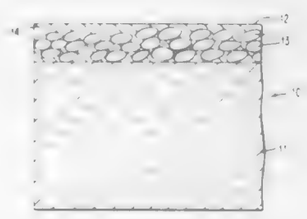


A method of making a photoresponsive device, in particular a television camera tube, employing a layer of PbO in which the PbO is vapor-deposited and subjected to the action of oxygen in combination with water vapor, hydrogen sulfide, tellurated or seleniated hydrogen to render the layer of PbO photo-sensitive.

3,372,057
COATED ELECTRODE FOR ARC WELDING OF CAST IRON
Horst Seifahrt, Lausanne, Switzerland, assignor to Societe des Soudures Castolin S.A., St. Sulpice, near Lausanne, Switzerland
No Drawing. Filed Sept. 4, 1964, Ser. No. 394,607
Claims priority, application Switzerland, Sept. 6, 1963, 11,087/63
5 Claims. (Cl. 117—206)

An electrode suitable for arc welding cast iron, gray cast iron, globular cast iron, and the like is provided by using ferro-nickel as a core element coated with a composition containing an alkali earth metal, fluorine, aluminum, silicon oxide, iron, carbon dioxide in form of a carbonate and carbon. A binder for the above components and a plasticizer for the coating is also provided. An iron to nickel relationship of approximately 40 to 60 to a 60 to 40 is suitable for the core element. A coating factor showing a relationship between the diameter of the coated electrode and the core is advantageously from 1.35 to 1.50.

3,372,058
ELECTRICAL DEVICE, METHOD AND MATERIAL
James R. Boyd, Austin, Tex., and Arthur H. Mones, Poughkeepsie, and John C. Schottmiller, Penfield, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 18, 1963, Ser. No. 331,534
11 Claims. (Cl. 117—227)

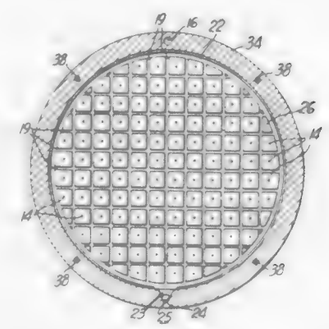


Metal glaze resistive compositions suitable for application to a ceramic dielectric comprising 15 to 70% of a palladium or rhodium oxide having a crystallite size with a surface area of at least 0.75 $m.^2/gm.$ and up to 35% of a conductive metal dispersed in a glass matrix comprising 35 to 70% vitreous enamel frit.

3,372,059
CHEMICAL REDUCTION PROCESS FOR SILVER, COPPER, OR NICKEL DEPOSITION
Harold H. Roth, Bay City, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Continuation-in-part of application Ser. No. 321,362, Nov. 4, 1963. This application Apr. 24, 1967, Ser. No. 632,910
8 Claims. (Cl. 117—227)

This disclosure concerns a method for readily controlling the rate of deposition of an electroconductive film of silver, copper or nickel on a non-conductive surface by chemical reduction of an aqueous plating bath of a water-soluble silver, copper or nickel salt with a reducing agent by adding to such a conventional plating bath a small proportion of a water-soluble resinous polymeric acrylamide, which resinous polymeric acrylamide controls the rate of deposition of the silver, copper or nickel.

3,372,060
FLUID DISTRIBUTION MEANS IN A FUEL CELL
John L. Platner, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Filed Dec. 26, 1962, Ser. No. 247,219
14 Claims. (Cl. 136—86)



1. A fuel cell comprising a fluid permeable electrode; a fluid distribution member adjacent the electrode and having a surface abutting the electrode; a reactive fluid chamber adjacent the member for receiving fuel fluid; said member having a plurality of distribution holes communicating between the electrode and the chamber and a recess in the surface abutting the electrode located between the distribution holes; means for delivering reactive fluid only to the distribution holes; and outlet means for receiving reactive fluid only from the electrode via the recess.

3,372,061
FUEL CELL INCLUDING POROUS PALLADIUM-SILVER ALLOY ELECTRODE
Jeremy Forten, New York, N.Y., assignor to Leesona Corporation, Warwick, R.I., a corporation of Massachusetts
Continuation-in-part of application Ser. No. 143,561, Oct. 9, 1961. This application Aug. 19, 1965, Ser. No. 480,886
5 Claims. (Cl. 136—86)

1. A fuel cell for the direct generation of electricity from a fuel and oxidant comprising a housing, a porous cathode comprising a palladium-silver alloy consisting essentially of palladium and from about 0.25–62 atomic percent silver, an anode and an electrolyte between said cathode and anode.

3,372,062
NOBLE METAL THERMOCOUPLE HAVING BASE METAL LEADS
Edward D. Zysk, Livingston, N.J., assignor to Engelhard Industries, Inc., Newark, N.J., a corporation of Delaware
No Drawing. Filed June 22, 1964, Ser. No. 377,129
3 Claims. (Cl. 136—227)

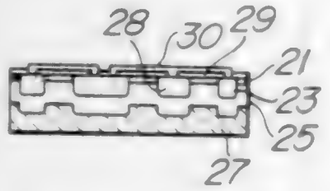
1. A thermocouple comprising a thermocouple positive leg wire composed of 82.5–83.5% palladium, 13.5–14.3% platinum and 2.8–3.3% gold by weight and a thermocouple negative leg wire composed of 64.5–65.5% gold, 34.0–35.2% palladium and 0–0.99% platinum, said positive leg wire and said negative leg wire being electrically joined to form a hot junction, a positive lead wire composed of 97.4–98.8% copper, 0.7–1.5% nickel, 0.5–1.1% manganese, and 0–0.01% carbon by weight, said positive lead wire being joined to said positive leg wire to form a tie point, and a negative lead wire composed of 45–60% copper, 40–55% nickel, 0–15% iron, 0–1.4 manganese and 0–0.1% carbon by weight, said negative lead wire being joined to said negative leg wire to form a tie point.

3,372,063

METHOD FOR MANUFACTURING AT LEAST ONE ELECTRICALLY ISOLATED REGION OF A SEMICONDUCTIVE MATERIAL

Michio Suzuki, Hachioji-shi, and Shoji Tauchi, Kokubunji-shi, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan

Filed Dec. 17, 1965, Ser. No. 514,481
Claims priority, application Japan, Dec. 22, 1964, 39/72,006
9 Claims. (Cl. 148—1.5)



A method for manufacturing at least one electrically isolated region of a semiconductive material, comprising the steps of depositing a first insulating layer in a predetermined pattern upon a substrate of monocrystalline semiconductive material, growing a semiconductive layer over both the exposed substrate and the insulating layer, whereby a monocrystalline layer is formed upon the exposed substrate and a polycrystalline layer is formed upon the insulating layer, subsequently, chemically etching both the monocrystalline and polycrystalline layers until the latter is completely removed while the former is only somewhat reduced in thickness, next applying a second insulating layer over both the exposed first insulating layer and the monocrystalline layer, and finally, depositing a material of high thermal conductivity over said second insulating layer and removing the semiconductor substrate.

3,372,064

METHOD FOR PRODUCING BLACK COATINGS ON METAL SURFACES

Robert R. Jones, Perry, and Howard G. Pekar, Cleveland, Ohio, assignors to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Jan. 6, 1967, Ser. No. 607,622
10 Claims. (Cl. 148—6.15)

Black matte coatings which are uniform in appearance and thickness and stable under relatively severe wear conditions are produced on metal surfaces by treating the surface with an aqueous acidic solution of a trivalent antimony salt and then depositing a protective coating, preferably a phosphate coating, thereon. The coating is somewhat darker if the phosphate solution contains nickel, and the antimony-containing solution remains homogeneous over longer periods of time if it contains a small amount of a stannous salt.

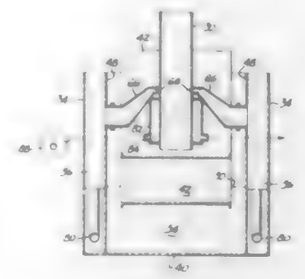
3,372,065

METHOD FOR HEAT TREATING ARTICLES

William R. Keough, Birmingham, Mich., assignor of forty-five percent to Multifastener Company, Detroit, Mich., a partnership

Filed Oct. 11, 1963, Ser. No. 315,467
7 Claims. (Cl. 148—13)

A method of heat treating articles by transfer from a heat treatment furnace into a quenching bath. The articles are passed through streams of cooling fluid continuously flowing towards the surface of the bath from a



point above the surface of the bath. The downwardly directed streams will eliminate splashing of the quenching liquid into the furnace.

3,372,066

COATED CARBIDE PARTICLES

Joseph F. Quaas, Island Park, N.Y., assignor to Eutectic Welding Alloys Corporation, a corporation of New York

No Drawing. Filed May 6, 1964, Ser. No. 365,503
17 Claims. (Cl. 148—24)

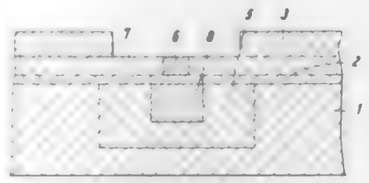
1. A discrete refractory carbide particle the surface of which is encompassed by a coating, said coating comprising a binder and a fluxing and protecting agent selected from the group consisting of boric acid, a metal borate, mixtures thereof and mixtures of said boric acid and metal borates with a member selected from the group consisting of metal fluoride, a metal chloride and mixtures thereof.

3,372,067

METHOD OF FORMING A SEMICONDUCTOR BY MASKING AND DIFFUSION

Horst Schäfer, Herrlingen, Germany, assignor to Telefunken Patentverwertungsgesellschaft m.b.H., Ulm (Danube), Germany

Filed Feb. 25, 1964, Ser. No. 347,260
Claims priority, application Germany, Feb. 25, 1963, T 23,520
25 Claims. (Cl. 148—187)



17. A method of making a transistor, comprising the steps of: applying onto a semiconductor body made of a material selected from the group consisting of germanium and the Group 3–Group 5 compounds a layer of silicon in elemental form; oxidizing the silicon layer throughout a portion of its thickness; etching a base-diffusion window through the silicon oxide layer; diffusing impurities through said window and through the remaining silicon layer into the semiconductor body for forming the base zone; thereafter again oxidizing the remaining silicon layer throughout at least a portion of its thickness; etching an emitter-diffusion window through the last-created silicon oxide layer; and diffusing impurities through said last-mentioned window and through any remaining silicon layer into the semiconductor body for forming the emitter zone.

3,372,068

HEAT TREATMENT FOR IMPROVING PROOF STRESS OF NICKEL-CHROMIUM-COBALT ALLOYS

Carol Henry White, Burley Gate, and William Iain Mitchell, Solihull, England, assignors to The International Nickel Company, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 20, 1965, Ser. No. 499,087
8 Claims. (Cl. 148—162)

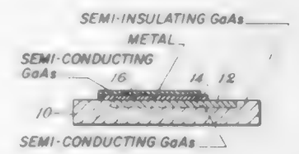
7. A process of heat treating a precipitation hardenable, columbium-containing, nickel-chromium-cobalt alloy to improve the proof stress characteristic thereof which comprises subjecting an alloy containing from 0.04% to 0.09% carbon, 18% to 22% chromium, 13% to 15% cobalt, from 4.7% to 5.3% columbium, 4% to 6.5% molybdenum, 2.1% to 2.75% titanium, 0.3% to 0.8% aluminum, the combined titanium and aluminum contents exceeding 2.5%, from 0.001% to 0.01% boron and from 0.01% to 0.1% zirconium, the balance, except for impurities, being nickel, to a solution heating within the range of 1050° C. to 1150° C. for from about ½ hour to 8 hours, cooling the alloy to retain the solution formed, pre-aging the alloy over the temperature range of about 630° C. to 670° C. for a period of ¼ hour to 8 hours to thereby develop a fine precipitate of substantially the gamma ′ phase but without concomitantly forming any appreciable quantity of the eta phase, aging the alloy at a temperature of 750° C. to 850° C. and thereafter cooling the alloy.

3,372,069

METHOD FOR DEPOSITING A SINGLE CRYSTAL ON AN AMORPHOUS FILM, METHOD FOR MANUFACTURING A METAL BASE TRANSISTOR, AND A THIN-FILM, METAL BASE TRANSISTOR

Louis G. Bailey, Richardson, and Edward W. Mehal, Dallas, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Filed Oct. 22, 1963, Ser. No. 317,917
13 Claims. (Cl. 148—175)



Disclosed is a semiconductor device such as a metal base transistor and the method of making the same. A semiconducting region is formed in a semi-insulating substrate and a metal film is deposited on at least a portion of the semiconducting region. Epitaxial growth is initiated on the substrate around the metal film and continued until the epitaxial growth reaches the upper surface of the metal layer, and then further continued so that the epitaxial growth extends in a lateral direction over the metal film.

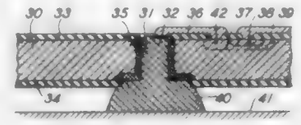
3,372,070

FABRICATION OF SEMICONDUCTOR INTEGRATED DEVICES WITH A PN JUNCTION RUNNING THROUGH THE WAFER

Paul Zuk, Allentown, Pa., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed July 30, 1965, Ser. No. 476,073
5 Claims. (Cl. 148—186)

1. The method of fabricating a semiconductor device including the steps of forming a slice of semiconductor material, perforating said slice to form at least one hole therethrough, said hole having a wall, diffusing a significant impurity through the wall of said hole to alter the conductivity of a zone adjoining said wall, vapor-depositing semiconductor material of the same conductivity type



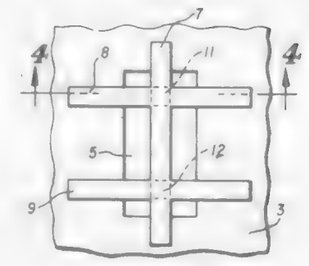
as the diffusant impurity upon said wall and within said hole and extending outwardly from at least one end of said hole, thereby to produce a pedestal portion of said semiconductor material.

3,372,071

METHOD OF FORMING A SMALL AREA JUNCTION SEMICONDUCTOR

Emery C. Wisman, Richardson, and Jack H. Abernathy, Jr., Dallas, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Filed June 30, 1965, Ser. No. 468,371
4 Claims. (Cl. 148—187)



Disclosed is a method of making a semiconductor device by forming a first slot into which an impurity material may be diffused. Thereafter, the surface containing the impurity is coated with an oxide and then an aperture opened therein by coating the oxide with a photosensitive material and subjecting the photosensitive material to light through two successive masks having clear and opaque regions to form a pattern resulting from the intersection of opaque region on said successive masks, said intersection being removed to form an opening in the photosensitive material.

3,372,072

GELLING WATER-BEARING EXPLOSIVES

Joseph D. Chrisp, Claymont, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Sept. 16, 1966, Ser. No. 579,852
17 Claims. (Cl. 149—20)

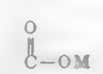
1. In the process for making water-bearing explosives which comprises bringing together water, fuel and an oxidizing component consisting essentially of inorganic oxidizing salt, the improvement which comprises gelling the aqueous phase of said explosives by copolymerizing in situ a mixture of mono- and polyethylenically unsaturated monomers soluble and stable in the system, said mixture comprising:

(a) about from 0.3 to 10%, by weight, based on the aqueous phase of monomer selected from at least one of the group consisting of (1) monomers having the formula

$$CH_2=\underset{\displaystyle R}{C}-X$$

wherein R is hydrogen, lower alkyl or hydroxyalkyl of up to 4 carbons, inclusive, X is —COOH,

or

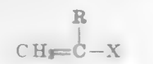


where M is alkali metal or ammonium, and (2) soluble salts of monovinyl pyridines; and

(b) about from 1 to 30%, based on the weight of (*a*) of polyethylenically unsaturated monomer polymerizable with (*a*) having at least two terminal methylene groups.

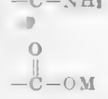
10. In water-bearing explosives comprising fuel, water and an oxidizing component consisting essentially of inorganic oxidizing salt, the improvement which comprises providing an aqueous phase thickened by the in situ polymerization of:

(a) about from 0.3 to 10%, by weight, based on said aqueous phase, of monomer selected from at least one of the group consisting of (1) monomers having the formula



wherein R is hydrogen, lower alkyl or hydroxyalkyl of up to 4 carbons, inclusive, X is —COOH,

or



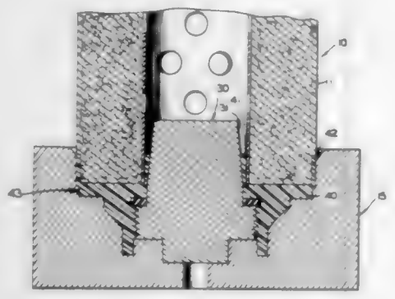
where M is alkali metal or ammonium and (2) soluble salts of monovinyl pyridines; and

(b) about from 1 to 30%, based on the weight of (*a*) of polyethylenically unsaturated monomer polymerizable with (*a*) having at least two terminal methylene groups.

3,372,073
PROCESS FOR MAKING A MOLDED FILTER ASSEMBLY

Mac C. Cutler, Los Gatos, Calif., assignor to Filters, Inc., San Jose, Calif., a corporation of California

Continuation of application Ser. No. 424,301, Jan. 8, 1965, which is a division of application Ser. No. 244,052, Dec. 12, 1962, now Patent No. 3,186,552. This application July 15, 1966, Ser. No. 568,693
7 Claims. (Cl. 156—69)



1. A method of securing a molded plastic resin end cap with threads and a ring gasket formed integral therewith to a filter cartridge comprising:

taking a mold die member with an annular cavity having an enlarged annular upper section, an annular tapered section therebelow terminating in a narrow annular section forming the bottom of the cavity, with threads on the inner surface of the cavity adjacent the tapered section, and a horizontal annular shoulder section in the cavity above the threaded formation to form a gasket seat;

placing a ring gasket on the horizontal shoulder section;

filling the cavity with liquid plastic material to cover the threads and gasket and substantially fill the cavity;

submerging the end of an annular filter cartridge into said cavity to a depth substantially adjacent the lower portion of said enlarged upper section; and

setting the plastic material until it hardens to a solid state.

3,372,074
MANUFACTURE OF LAMINATED SAFETY GLASS

Aime Louis Rocher, Sainte-Colombe-les-Vienne, and Henri Rhety, Venissieux, France, assignors to Rhone-Poulenc S.A., Paris, France, a corporation of France

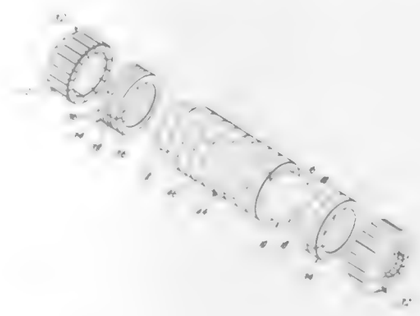
No Drawing. Filed June 12, 1964, Ser. No. 374,817
4 Claims. (Cl. 156—106)

The adhesion of plasticized polyvinyl butyral to glass sheets in the production of safety glass laminates is improved by conditioning the polyvinyl butyral in an atmosphere substantially saturated with water vapour or the vapour of an aqueous volatile acid.

3,372,075
METHOD OF MAKING AN INSULATED STORAGE TANK

Charles R. Holt, Norman, and Ray A. Madewell, Ardmore, Okla., assignors, by mesne assignments, to Amercoat Corporation, Brea, Calif., a corporation of California

Filed Mar. 6, 1964, Ser. No. 349,807
16 Claims. (Cl. 156—172)



11. The method of making an insulated storage tank using sandwich construction comprising,

helically winding a resin impregnated glass fiber inner shell including a cylindrical section and at least one dome shaped end section,

curing the inner shell,

preforming the core of insulating material for contouring over the dome section,

forming a short cylindrical section of insulating material sized to fit around the cylindrical section of the inner shell,

bonding the short cylindrical section to the dome shaped insulating material section,

placing the short cylindrical and domed sections of insulated material over the inner shell and attaching them thereto by winding glass fibers around the cylindrical section,

cutting a diagonal line across a rectangular section of insulating material forming first and second pie shaped transition pieces,

placing each of said pie shaped transition pieces on the inner cylindrical shell at each end,

helically wrapping segments of insulating material about the inner cylindrical shell and securing them thereto by wrapping with glass fibers,

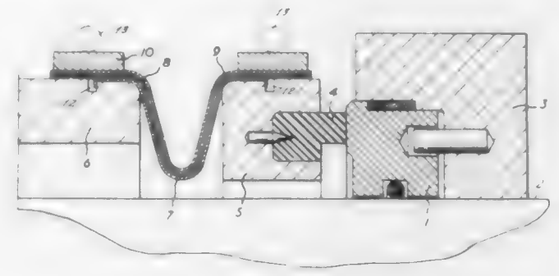
helically winding a resin impregnated glass fiber outer shell under tension over the insulation of said cylindrical and domed sections, and

curing the outer shell.

3,372,076
METHOD OF FORMING A FLEXIBLE BELLOWS CONNECTION BETWEEN AXIALLY SPACED MEMBERS

Samuel Clifford Walter Wilkinson, Cookham, England, assignor to Crane Packing Limited, Slough, England, a British company

Filed Jan. 31, 1964, Ser. No. 341,714
Claims priority, application Great Britain, Feb. 6, 1963, 4,928/63
5 Claims. (Cl. 156—190)

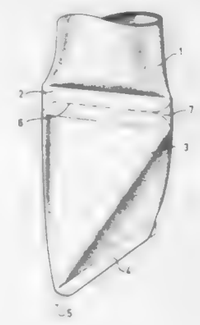


A large-diameter bellows type seal or expansion joint is assembled in situ by spirally wrapping successive layers of different materials including fabric, rubberised fabric, plastics or fabric-reinforced plastics and also including a flexible profiled metal strip circumferentially around axially spaced members of the joint and securing the spirally wrapped material to the axially spaced members by suitable clamping means.

3,372,077
METHOD OF MANUFACTURING PACKAGES

Stig Erik Sigvard Torudd, Palsjovagen 13, Lund, Sweden

Filed Aug. 5, 1963, Ser. No. 299,731
Claims priority, application Sweden, Aug. 8, 1962, 8,645/62
1 Claim. (Cl. 156—198)



1. A method of manufacturing tetrahedron shaped packages from a tubular blank of relatively stiff material comprising the steps of: supplying said tubular blank of relatively stiff material to a forming zone, forming a first seal in said tubular blank by flat pressing and heat sealing said blank in a relatively narrow rectangular zone and leaving a V-shaped unsealed area at each end of said seal, forming a second seal above and at an angle to said first seal in said tubular blank by flat pressing and heat sealing and blank in another relatively narrow rectangular zone leaving V-shaped unsealed areas at the ends of said second seal, severing said second seal substantially in the center thereof after sealing, and blunting the unsealed V-shaped areas in said first and second seals.

3,372,078
PROCESS FOR MANUFACTURING RUBBER STRIPS TO BE USED IN PNEUMATIC TIRES

Fulcieri Fausti, Bollate, Milan, and Angelo Morando, Milan, Italy, assignors to Pirelli, S.p.A., Milan, Italy

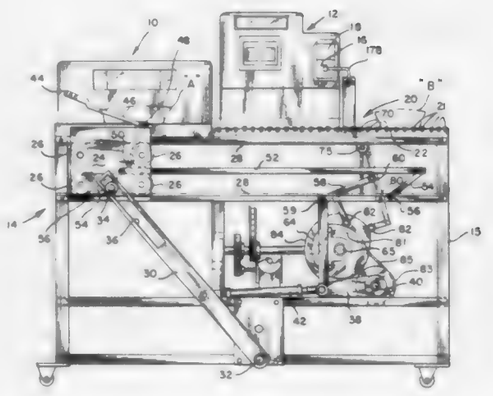
No Drawing. Filed Nov. 21, 1963, Ser. No. 325,445
Claims priority, application Italy, Dec. 5, 1962, 23,927/62
4 Claims. (Cl. 156—306)

A partially cured rubber insert for use in the manufacture of tires is prepared by superimposing two different rubber layers, each containing vulcanizing agents, moderately heating the superimposed layers to cause migration of the vulcanizing agents to the contact zone between the layers so that the inner portion of the resulting unit is cured while the outer portions of the unit remain uncured. The uncured portions of the unit are subsequently cured during the tire manufacturing process.

3,372,079
AUTOMATIC LABEL APPLYING MACHINE

Phillip J. Fellner and Edward S. Mickiewicz, Racine, Wis., assignors to Sturtevant Industries, Inc.

Continuation-in-part of application Ser. No. 451,397, Apr. 28, 1965. This application Feb. 23, 1966, Ser. No. 538,131
10 Claims. (Cl. 156—360)

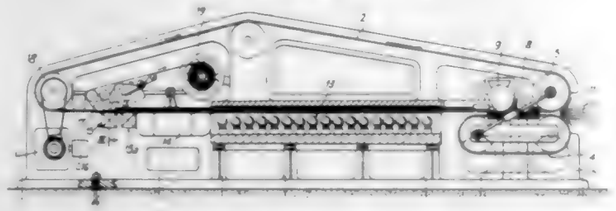


Automatic scale and label printing and applying machine for weighing and printing labels for prewrapped packages including a roller conveyor for the scale for permitting packages to move freely on the scale, come to a stop thereon for accurate weighing, and then be moved, off the scale, all without sticking or undesired hesitation of the package on the scale and without causing malfunction of the scale. The movement of the package onto the scale, its stopping for weighing, and its movement off the scale are all timed with the other functioning of the automatic machine such as stopping the appropriate package at the label applying station and subsequently removing it from said station.

3,372,080
MACHINE FOR THE MANUFACTURE OF FLEXIBLE BANDS FITTED WITH HOOKED ELEMENTS

Jean Billarant, 2 Ave. Odette, Nogent-sur-Marne, Seine, France

Filed Nov. 23, 1964, Ser. No. 412,899
Claims priority, application France, Nov. 29, 1963, 955,515
13 Claims. (Cl. 156—435)

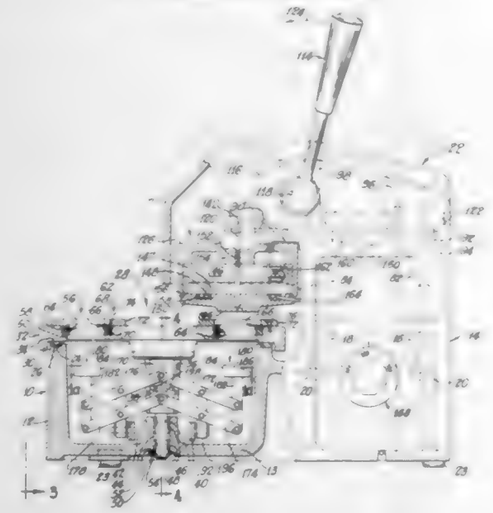


A machine for cutting loop-shaped elements, embedded in a sheet of plastic material, into hook-shaped elements.

3,372,081
APPARATUS FOR PRODUCING FUSED THERMOPLASTIC SEALS

Alfred A. Hurschman, Hudson, Ohio, assignor to Ampoules, Inc., Hudson, Ohio, a corporation of Ohio

Continuation-in-part of abandoned application Ser. No. 357,985, Apr. 7, 1964. This application July 21, 1964, Ser. No. 384,228
10 Claims. (Cl. 156—583)



A press for heat sealing plate-like thermoplastic resin comprising a pair of opposed relatively movable pressure-applying dies and an actuator linkage for moving the dies together. One of the dies has a soft elastomeric base upon which a relatively rigid contact member having a smooth planar face is mounted.

3,372,082
HOLLOW FILAMENTS OF A TETRAFLUOROETHYLENE POLYMER AND PROCESS FOR PREPARING THEM

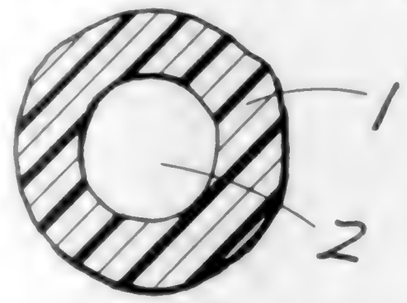
Yutaka Kometani, Hyogo-ken, Yutaka Koda, Osaka-fu, Tadahiko Sugino, Osaka-shi, and Hirokazu Izumi, Amagasaki-shi, Japan, assignors to Daikin Kogyo Kabushiki Kaisha, Osaka-shi, Japan

Filed Dec. 2, 1964, Ser. No. 415,327
Claims priority, application Japan, Dec. 6, 1963, 38/65,774
4 Claims. (Cl. 161—178)

Hollow filaments consisting of a tetrafluoroethylene polymer layer and an empty space cavity within, said empty space cavity comprising from 5 to 90 percent in terms of

$$\frac{S_b}{S_a + S_b} \times 100$$

wherein S_a is the total area of the tetrafluoroethylene polymer layer at a given cross-section of said hollow filament, and S_b is the total area of the empty space cavity formed therein at said given section produced by extruding a mixture of a viscose and an aqueous dispersion of a tetrafluoroethylene polymer at a temperature ranging from 50° to 100° C. into a setting medium selected from the group consisting of a bath containing

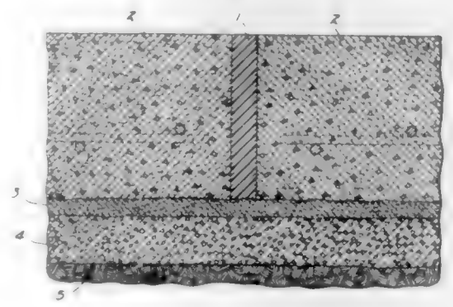


sulfuric acid in the order of from 6 to 60 percent by weight, a bath containing sulfuric acid in the order of at most 6 percent by weight and a sulfuric acid salt in the order of at least 5 percent by weight, a bath containing hydrochloric acid in the order of from 1 to 30 percent by weight, and a bath containing nitric acid in the order of from 1 to 50 percent by weight, and heating the resultant filament product to coalesce the tetrafluoroethylene polymer forming said filament product, said starting spinning mixture comprising cellulose in the order from 0.4 to 8 percent by weight and a tetrafluoroethylene polymer in the order of from 70 to 99 percent by weight of the combined weight of said cellulose and polymer.

3,372,083
COMPOSITIONS AND ARTICLES FROM THE REACTION OF AN ISOCYANATE TERMINATED POLYURETHANE AND THE ISOCYANATE ADDUCT OF BITUMEN

Robert M. Evans, Chesterland, and Bernardas Brizgys, Lyndhurst, Ohio, assignors to The Master Mechanics Company, Cleveland, Ohio, a corporation of Ohio

Filed Mar. 11, 1964, Ser. No. 351,065
20 Claims. (Cl. 161—190)



Floor tile, and caulking for glass and concrete containing a polyurethane, cured by water from the air to a solid having an elongation capacity greater than 100%, is made from the reaction of an isocyanate terminated prepolymer and the isocyanate adduct of an unmodified tar. This may be prepackaged in a single container and hardened only when exposed to the moisture from the air at the point of use. Also chlorinated hydrocarbons and organic silicones may be included. The caulking materials may be applied to wet joints.

3,372,084
POST-FORMABLE ABSORBENT PAPER

Hanns F. Arledter, Chillicothe, Ohio, assignor to The Mead Corporation, Dayton, Ohio, a corporation of Ohio

No Drawing. Continuation-in-part of application Ser. No. 323,571, Nov. 14, 1963. This application July 18, 1966, Ser. No. 565,688
13 Claims. (Cl. 162—128)

This invention relates to post-formable decor and overlay papers for use in plastic laminates, and to the laminates made therefrom. The papers are characterized by use of from 35 to 100% of fine fibers of vegetable or synthetic organic origin having a specific volume of 75–175 cubic microns and an average length over 2 mm. The balance of the fiber portion is paper making wood pulp. The papers contain an acid acceptor such as zinc oxide, calcium carbonate or calcium silicate, and are essentially neutral, as indicated by a pH of water extract in the range of 6.8 to 7.6, with an alkali number of 0.5 to 3.0. The plastic laminates using these papers as decor and/or overlay sheets are post-formable to a radius of ½ inch or less.

3,372,085
WATER-SOLUBLE POLYALKYLENEPOLYAMINE/URETHANE RESINS AND APPLICATION THEREOF IN PRODUCTION OF WET STRENGTH PAPER

Paul M. Westfall, St. Albans, and Nelson R. Eldred, South Charleston, W. Va., and John C. Spicer, Sidney, N.Y., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Apr. 14, 1965, Ser. No. 447,959
11 Claims. (Cl. 162—164)

The cationic water-soluble resinous reaction product of (a) a polyfunctional halohydrin and (b) a resin produced by reaction of a polyalkylenepolyamine with a urethane formed by the reaction of an alkanol containing 1 to 6 carbon atoms and tolylene diisocyanate. The product is useful in paper products as a wet strength improving agent. The method for incorporation of the novel polymers in paper products, as well as the paper products are also novel.

3,372,086
WATER-SOLUBLE POLYALKYLENEPOLYAMINE/DIALDEHYDE RESINS AND APPLICATION THEREOF IN PRODUCTION OF WET STRENGTH PAPER

Paul M. Westfall, St. Albans, and Nelson R. Eldred, South Charleston, W. Va., and John C. Spicer, Sidney, N.Y., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Apr. 14, 1965, Ser. No. 447,980
14 Claims. (Cl. 162—164)

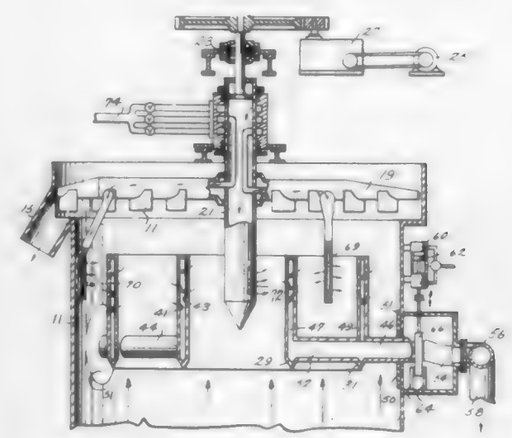
A cationic water-soluble resinous reaction product of (a) a polyfunctional halohydrin and (b) a resin produced by reaction of a polyalkylenepolyamine with a saturated aliphatic dialdehyde of 2 to 6 carbon atoms. The product is useful in paper products as wet strength improving agents. The method for incorporation of the novel polymers in paper products as well as the paper products are also novel.

3,372,087
SELF-CLEANING SIEVE DEVICE IN CONTAINERS FOR CELLULOSIC PULP

Johan C. F. C. Richter, St.-Jean-Cap-Ferrat, France, assignor to Aktiebolaget Kamyr, Karlstad, Sweden, a company of Sweden

Filed Apr. 20, 1964, Ser. No. 360,962
Claims priority, application Sweden, May 20, 1963, 5,556/63
7 Claims. (Cl. 162—251)

There is provided an apparatus for deliquefying a pulp suspension in connection with a chemical treatment and/or washing of the pulp, wherein sieve bodies are disposed in a container and the pulp suspension moves through the container in an axial direction. The sieve bodies are hollow and have sieve faces elongated in the direction of the pulp flow through which the liquid passes. The sieve bodies are moved in the direction of the pulp flow at substantially the same rate as the pulp flow whereby



washing liquids and/or treating chemicals move horizontally towards the sieve bodies and in a direction transverse to the pulp flow. After a predetermined movement of the sieve bodies, they are rapidly returned to their initial position whereby the rapid movement of the sieve bodies opposite to the direction of pulp flow removes fibers that have stuck to the sieve faces.

3,372,088
METAL PHOSPHIDE PESTICIDES

Werner Freyberg, am Weissenberg 33, and Wolfgang Friemel, am Weissenberg 9, both of Kirschhausen uber Heppenheim, Bergstrasse, Germany

No Drawing. Continuation-in-part of application Ser. No. 237,327, Nov. 13, 1962. This application Nov. 8, 1965, Ser. No. 506,846
Claims priority, application Germany, Nov. 25, 1961 F 34,416
10 Claims. (Cl. 167—14)

1. A pesticidal composition for combatting pests which comprises at least 50 percent by weight based on the total mixture of aluminum phosphide, calcium phosphide or magnesium phosphide in admixture with 0.5 to 50 percent by weight based on the total mixture, of an aluminum, cadmium, calcium, magnesium or zinc salt of an aliphatic monocarboxylic acid having between 12 and 22 carbon atoms in the fatty acid radical and 5 to 50 percent by weight based on the total mixture of a solid strongly hygroscopic compound which does not react with the phosphide, to protect the hydrophilic centers of the phosphide against moisture.

3,372,089
COMBATING *STAPHYLOCOCCUS AUREUS* WITH 3-THIETANOL

Arleen C. Pierce, New Brunswick, N.J., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Aug. 15, 1966, Ser. No. 572,241
2 Claims. (Cl. 167—33)

3-thietanol may be used effectively for combating microorganisms, particularly *Staphylococcus aureus* cells, in vapor phase.

3,372,090
STREPTONIGRIN ANTIBIOTICS AND PROCESS FOR THEIR PRODUCTION

William S. Marsh, Wanaque, Aline L. Garretson, River Edge, and Koppaka V. Rao, Pinebrook, N.J., assignors to Chas. Pfizer & Co., Inc., New York, N.Y., a corporation of Delaware

Continuation-in-part of applications Ser. No. 753,967, Aug. 8, 1958, Ser. No. 823,469, June 29, 1959, Ser. No. 39,535, June 29, 1960, and Ser. No. 190,520, Apr. 17, 1962. This application July 5, 1963, Ser. No. 293,148

18 Claims. (Cl. 167—65)

1. A process for the production of an antibiotic containing product which comprises cultivating a strain of microorganism selected from the group consisting of

	ATCC
Streptomyces flocculus	13257
Streptomyces flocculus	13535
Streptomyces flocculus	13536
Streptomyces bottropensis	13854
Streptomyces fungicidus	13853
Streptomyces flocculus	13852
Streptomyces flocculus	13851
Streptomyces flocculus	13850
Streptomyces flocculus	13859
Streptomyces flocculus	13855
Isolate BA–90744	13856
Streptomyces flocculus	13860
Streptomyces flocculus	13857
Streptomyces flocculus	13861
Streptomyces flocculus	13862
Streptomyces flocculus	13858

in an aqueous nutrient medium under submerged aerobic conditions until substantial antibiotic activity is imparted to said medium.

3,372,091
METHOD FOR PREPARING HEXAMETHYLENETETRAMINE HIPPURATE AND TABLETS THEREOF

Stanley E. Harnett and Nicolas A. Lagoon, Sherman Oaks, Calif., assignors to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware

No Drawing. Filed Jan. 25, 1965, Ser. No. 427,955

2 Claims. (Cl. 167—82)

This invention is directed to a method of preparing tablets of hexamethylenetetramine hippurate wherein the chemical reaction forming the hexamethylenetetramine hippurate occurs simultaneously with the preparation of a physical form of the salt which is suitable for tablet formation, said method comprising the mixing of substantially equimolar proportions of hexamethylenetetramine with hippuric acid in the presence of a liquid medium consisting of water only present in an amount of between about 0.5 and 12.5 percent by weight of the mixture, drying the mass, comminuting the dried mass, and forming tablets therefrom.

3,372,092
NUCLEAR REACTOR

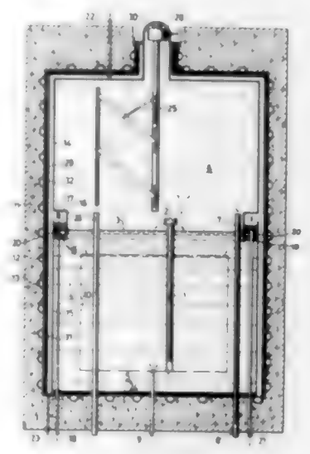
Peter Heinrich Erwin Margen, Nasbypark, Sweden, assignor to Aktiebolaget Atomenergi, Stockholm, Sweden, a corporation of Sweden

Filed July 21, 1965, Ser. No. 473,668

Claims priority, application Sweden, Mar. 12, 1965, 3,285/65

11 Claims. (Cl. 176—52)

1. A nuclear reactor, comprising a pressure vessel, a water space in the bottom of the pressure vessel, a reactive core within said water space, said reactor core containing fissile fuel to be cooled by water in said water space, a steam space in the top of the pressure vessel, a thin-walled shroud surrounding the steam space and spaced from the wall of the vessel to provide a relatively



narrow annular insulating space for a heat-insulating gas in said insulating space between the shroud and the wall of the pressure vessel, said shroud being provided with a water seal means for separating steam from said insulating space.

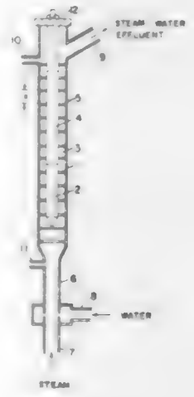
3,372,093
APPARATUS FOR INCREASING THE CRITICAL HEAT FLUX FOR HIGH PRESSURE STEAM/WATER FLOW IN NUCLEAR REACTORS

George A. Wikhammer and Ian P. L. Macdonald, both of Deep River, Ontario, Canada; and John G. Collier, c/o United Kingdom Atomic Energy Authority, Harwell, England

Filed Aug. 5, 1965, Ser. No. 477,478

Claims priority, application Canada, Aug. 31, 1964, 910,686

1 Claim. (Cl. 176—54)



A series of roughness rings attached to the inner surface of the fuel channels in a two-phased liquid-vapor cooled nuclear reactor of the type having the fuel in the form of a series of fuel bundles loaded inside pressurized fuel channels passing through the reactor and the coolant flowing under pressure through the channels, deflect or drive-off liquid that tends to collect on the inner surface of the fuel channels inwardly into the liquid-vapor coolant stream. This increases the temperature level at which the undesirable effects of "dry-out" will occur.

3,372,094
PROCESS OF MAKING CITRIC ACID BY FERMENTATION

William Gold, Spring Valley, N.Y., and Robert Kieber, Locust, N.J., assignors to Stepan Fermentation Chemicals, Inc., Keyport, N.J., a corporation of Delaware

No Drawing. Continuation-in-part of applications Ser. No. 74,793, Dec. 9, 1960, and Ser. No. 208,899, July 10, 1962. This application May 19, 1966, Ser. No. 551,194

5 Claims. (195—36)

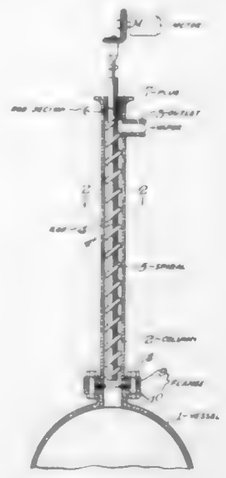
In the production of citric acid by fermentation, fatty material in amount of 0.05–0.3% v./v. is maintained in the medium throughout the fermentation. Increased yield and rate of fermentation are realized.

3,372,095
SEPARATOR

Ralph G. Nester, Fairfield, Del., assignor to Nester and Faust Manufacturing Corporation, a corporation of Delaware

Filed Nov. 5, 1964, Ser. No. 409,258

10 Claims. (Cl. 202—153)



A rotatable shaft having an embossed surface, the raised parts being in the form of helices extending along a substantial part of the shaft is provided, which shaft is placed within a column to be used in separation of liquids, as by distillation. The dimensions of the said shaft are such that in operation contact is made between the outermost portions of the helices and the inside walls of the column. The helices are present in the form of from about 0.5 to about 8 turns per inch. The apparatus also includes means for rotating the shaft, means for removing the material transported through the column, a means to connect the apparatus to a vacuum source and a reservoir for separated material.

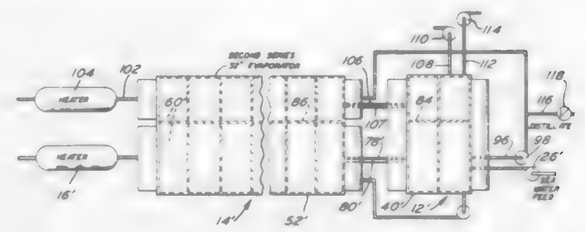
3,372,096
HIGH PURITY WATER FLASH EVAPORATOR WITH SERIES STAGES FOR REDISTILLATION OF DISTILLATE

Robert A. Tidball, Swarthmore, Pa., assignor to Baldwin-Lima-Hamilton Corporation, Philadelphia, Pa., a corporation of Delaware

Filed July 5, 1966, Ser. No. 562,715

5 Claims. (Cl. 202—173)

A flash evaporator wherein sea water is distilled in a first series of stages, and the resulting distillate is re-distilled in a second series of stages to provide a high purity distillate.

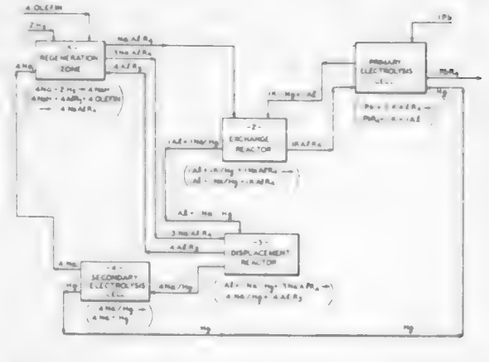


3,372,097
ELECTROLYTIC PROCESS FOR THE MANUFACTURE OF METAL ALKYLS

Karl Ziegler, Kaiser-Wilhelm-Platz 1, Mulheim (Ruhr), Germany, and Herbert Lehmkuhl, Mulheim (Ruhr), Germany; said Lehmkuhl assignor to said Ziegler

Filed June 28, 1963, Ser. No. 291,562

21 Claims. (Cl. 204—59)



1. Process which comprises passing an electrolysis current between a cathode and an anode through an electrolyte consisting essentially of a complex of the formula $KAlR_4$ wherein each R is alkyl, the anode being of a metal Me selected from the group consisting of lead, mercury, tin, and antimony, and the cathode being mercury, the electrolysis comprising decomposition of the electrolyte according to the following equation:

$$KAlR_4 + m\text{Me} \rightarrow K + Al + m\text{MeR}_n$$

wherein R and Me are as is defined above, n is the valence of Me and the product of m and n is 4, the metal alkyl being produced at the anode and the potassium being produced at the cathode and forming an amalgam with the mercury, the aluminum metal being in the amalgam, and separating aluminum from the amalgam.

3,372,098
PROCESS FOR RECOVERING SOLVENTS FROM ELECTROLYTES

Alfred O. Walker, Lake Jackson, Tex., assignor to Nalco Chemical Company, Chicago, Ill., a corporation of Delaware

No Drawing. Filed Jan. 21, 1965, Ser. No. 427,104

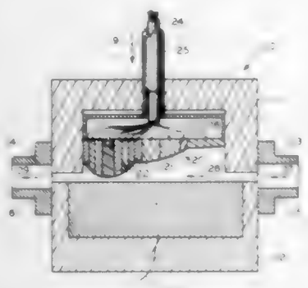
7 Claims. (Cl. 204—59)

1. In an electrolytic process wherein a mixture of a non-aqueous water immiscible organic liquid is separated from an aqueous brine in which at least 1% by volume of said liquid normally remains entrained when said liquid and said brine are mixed, the improvement which comprises increasing the amount of said liquid in said process to a point where an unstable emulsion is formed when said mixture is agitated, agitating said mixture to form said unstable emulsion, and thereafter separating the non-aqueous phase from the brine phase.

3,372,099
ELECTROCHEMICAL MACHINING USING A MULTISEGMENTED ELECTRODE WITH INDIVIDUAL CURRENT CONTROL FOR EACH SEGMENT

John E. Clifford, 357 Carilla Lane,
Columbus, Ohio 43228

Filed May 1, 1963, Ser. No. 277,194
34 Claims. (Cl. 204—143)



1. A method of electrolytically removing material from the surface of a workpiece comprising the steps of placing such surface in juxtaposition to but out of contact with an electrode tool comprising a plurality of conductive members insulated one from another and together providing a three-dimensional surface that is substantially complementary to a three-dimensional surface contour to be produced in the workpiece, supplying an electrolyte between the juxtaposed surfaces of the tool and the workpiece, advancing the juxtaposed surfaces relatively toward each other, and supplying current through the workpiece, the electrolyte, and the tool, the currents supplied to each of the conductive members of the tool being separately initiated with the current being supplied first to the member opposite which the greatest depth of material is to be removed from the workpiece, the current being supplied next to the member opposite which the next greatest depth of material is to be removed, and so on.

31. A method of preparing an electrode comprising the steps of tightly winding insulated wire around a cylindrical form in a plurality of contiguous layers, fastening the wound layers in fixed relation to a plane substantially parallel to the axis of said form, cutting through said layers in said plane, bending the resulting bundles of wires outwardly from the axis to provide space for access to the cut ends of the wires, the bundle of wires forming an electrode comprising a plurality of conductive members insulated one from another, and removing material from one surface formed by the ends of the wires to provide a conductive surface having a desired surface shape for use in electrolytic processes when current is supplied thereto by connections to the other ends of the wires.

34. A method of preparing an electrode comprising the steps of coating with aluminum the sides of a plurality of conductive members over a substantial area of each beginning adjacent to one end, further coating each said area with lead dioxide, assembling and retaining said conductive members in a bundle with said one ends forming a surface and with the coated areas of adjacent members in contact with each other, electroshaping said surface with said bundle connected as an anode in an electrolyte capable of anodically removing the materials of said members and the coatings thereon, heating said bundle to a temperature sufficient to diffuse oxygen from the outer coatings into the inner coatings to form a layer of aluminum oxide around each said conductive member and to cause the outer coatings of said members to adhere to each other, said surface being suitable for use in electrolytic processes when current is supplied thereto by connections to the other ends of said conductive members.

3,372,100
PROCESS FOR IMPROVING THE PROPERTIES OF A POLYMER BY CROSS-LINKING IN THE PRESENCE OF RADIATION

Arthur Charlesby, Shrivenham, Swindon, Wilts, and Solomon H. Pinner, Lexden, Colchester, England, assignors to Raychem Corporation, Redwood City, Calif., a corporation of California

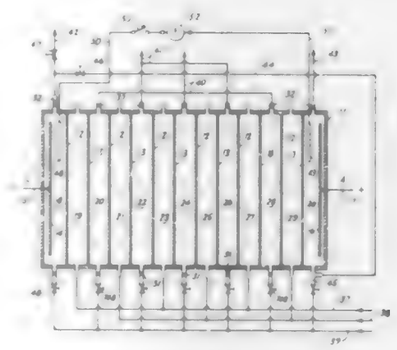
No Drawing. Continuation-in-part of application Ser. No. 639,218, Feb. 11, 1957. This application Feb. 11, 1963, Ser. No. 257,739
Claims priority, application Great Britain, Feb. 14, 1956, 4,587/56
2 Claims. (Cl. 204—159.17)

1. A process for improving the properties of polyvinyl chloride comprising the steps of mixing the polyvinyl chloride with less than its own weight of lauryl methacrylate and less than its own weight of ethylene dimethacrylate, forming the resulting mixture into a sheet, and then exposing said sheet to the action of high energy ionising radiation of energy greater than 100,000 electron volts to a dosage of between 0.1 and 10 megarads.

3,372,101
PROCESS OF PRODUCING HIGHLY REACTIVE COMPOUNDS BY METATHESIS

Paul Kollsman, 100 E. 50th St.,
New York, N.Y. 10022

Filed Oct. 8, 1962, Ser. No. 228,867
2 Claims. (Cl. 204—180)



1. The process of converting, under the influence of an electric current, a weakly acid compound composed of an anionic component A_1 and a cationic component C_1 into a strong acid compound, the process comprising,

maintaining the weakly acid compound, in solution, in a certain deionization chamber of a multichamber electrodialysis cell in which the space between the electrodes is subdivided into chambers by membranes of two kinds arranged in alternating sequence, the membranes of one kind being permeable to ions of one polarity and passage resistant to ions of the opposite polarity, the membranes of the other kind being permeable to ions of said opposite polarity, the membranes of the two kinds being arranged in alternating order, making every other chamber a deionization chamber and making the chambers between the deionization chambers product chambers, there being at least three chambers of one kind and at least two chambers of the other kind;

maintaining in at least another deionization chamber spaced from said certain chamber a solution of a companion source compound comprising a cationic component C_2 and an anionic component A_2, said other deionization chamber being spaced from said certain chamber by one product chamber, said companion source compound comprising one ionic compound of a certain polarity which with an ionic component of the opposite polarity of the weakly acid compound in the adjacent deionization chamber produces a strong acid, and said companion source compound being so selected with respect to the product compounds to be produced that the sum of the heats of formation of the source compounds exceeds the sum of the heats of formation of the product compounds, one of the source compounds being a gas dissolved in liquid;

maintaining in said one product chamber a conductive liquid;

maintaining said cell under above-atmospheric pressure;

applying an electrical direct potential across said membranes and chambers and the liquids therein;

and withdrawing strongly acid product liquid from said one product chamber.

3,372,102
ELECTROPHORETIC PRINTING USING SOURCE SHEET CONTAINING AN ADSORBENT MATERIAL

Donald J. J. Lennon, Acton, Mass., assignor to The Carter's Ink Company, Cambridge, Mass., a corporation of Massachusetts

Filed Jan. 16, 1964, Ser. No. 338,245
5 Claims. (Cl. 204—181)

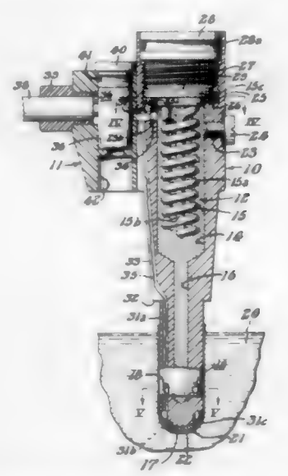
In electrophoretic printing ionizable dye particles are retained on an adsorbent material until an electrical field is applied to cause them to be transferred in the printing operation.

3,372,103
DISSOLVED OXYGEN PROBE

Vernon T. Stack, Jr., Chadds Ford, Pa., assignor to Roy F. Weston, Inc., Newtown Square, Pa., a corporation of Pennsylvania

Filed Nov. 3, 1964, Ser. No. 408,504
8 Claims. (Cl. 204—195)

An electro-chemical cell or probe is disclosed for use in determining the amount of oxygen dissolved in most liquids or gases and particularly in polluted or clear water. The probe has a chemically resistant body, preferably one which can be autoclaved, and a platinum tip which functions as the cathode. The anode is lead in rod or wire form. The electrolyte is preferably potassium iodide. The surface area of the lead anode is large relative to that of the platinum cathode, at least 30 to 1. The surface area of the lead rod in square inches relative to the volume of electrolyte in milliliters in greater than one. The platinum-lead-electrolyte combination of its own develops a potential internally sufficient for the reduction of oxygen to occur in the cell. No external applied potential is required to support the reduction of oxygen in the cell. A plastic membrane, selectively permeable to oxygen and other gases but impervious to the electrolyte and to the other inorganic and organic constituents of the water, covers the platinum tip and extends sufficiently upward to also cover radial passages which communicate with the electrolyte cavity. A temperature-insensitive resistance is connected between the terminals of the lead anode and the platinum cathode across which an output voltage is developed as a function of the oxygen entering the cell through the membrane and reduced therein. The value of the resistance determines the rate of the response of the probe, the amount of physically produced noise, and the sensitivity of the probe to turbulence. Therefore, this resistance should be held constant during operation. The voltage developed across the resistance is applied to the input terminals of an operational amplifier. A negative feedback circuit, having a thermistor therein, is provided between the output and input terminals of the amplifier, for compensating for temperature variations of the output of the probe. Thus, changes in the thermistor with temperature does not effect the load resistance of the probe and does not alter the response of the probe, but does



correct for the changes of the probes output with temperature.

The output of the probe is directly proportional to the dissolved oxygen and has a zero output when the dissolved oxygen is zero. Hence, the same probe is usable with the proper analyzer for trace (parts per billion) analysis of oxygen in water or gas streams.

GLASS ELECTRODE COMPOSITION

James W. Ross, Newton, Mass., and Normand C. Hebert, Corning, N.Y., assignors to Corning Glass Works, Corning, N.Y., a corporation of New York

No Drawing. Filed May 18, 1964, Ser. No. 368,322
4 Claims. (Cl. 204—195)

Glass electrode having a pH sensitive membrane of a glass composition consisting essentially of a lithium silicate containing minor amounts of Cs_2O and/or Rb_2O, a rare earth metal oxide and especially Ta_2O_3 together with UO_2.

3,372,105
ALUMINUM REDUCTION CELL AND INSULATION MATERIAL THEREFOR

Arthur F. Johnson, 5700 Arlington Ave.,
Riverdale, N.Y. 10471

Filed Oct. 22, 1962, Ser. No. 231,969
15 Claims. (Cl. 204—243)

1. A refractory material for insulating a structure comprising:

a sheet with at least some flexibility;

a first layer of a size-graded mixture of refractory mineral particles bonded to said sheet;

a second layer of refractory mineral particles having a higher melting point than said first layer bonded on top of said first layer;

said particles being selected from the group consisting of the oxides, carbides, nitrides, oxycarbides and oxynitrides of zirconium and titanium, the oxides of calcium and chromium, and the carbides, nitrides, oxycarbides and oxynitrides of silicon and aluminum; and

means capable of bonding said particles and said sheet to the structure desired to be insulated.

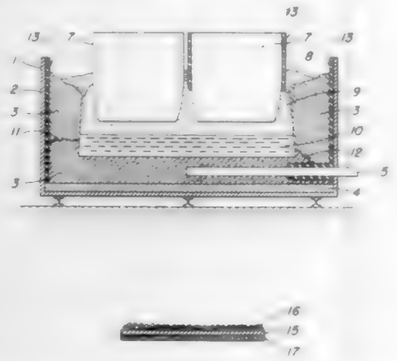
14. An aluminum reduction cell comprising:

a metallic shell;

a carbonaceous lining;

a plurality of collector bars embedded in said lining;

a layer of insulating material between said shell and said lining, at least a portion of said insulating material comprising;



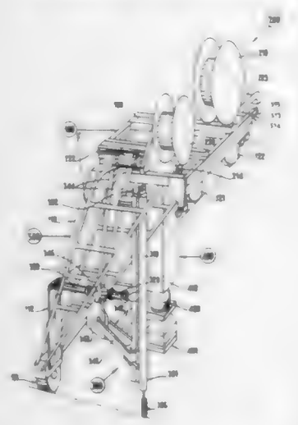
a thin, dense layer of size-graded, electrically nonconductive refractory mineral particles, said particles forming solid, higher melting compounds upon contact with molten aluminum or cryolite.

3,372,106

MACHINE AND METHOD FOR CRUST PIERCING AND FEEDING OF MOLTEN ELECTROLYTIC BATHS

Jacques Chambran, Tarascon-sur-Ariege, France, assignor to Pechiney, Compagnie de Produits Chimiques et Electrometallurgiques, Paris, France

Filed Sept. 23, 1964, Ser. No. 398,566
Claims priority, application France, Sept. 24, 1963, 948,473
25 Claims. (Cl. 204—245)



A machine for feeding powdered alumina into molten baths having a crust on the surfaces thereof and through which anodes extend into the baths for the production of aluminum by electrolysis and in which a plurality of such baths are aligned in side by side spaced apart relation, said machine comprising a carriage and means for displacement of the carriage from a starting position to a position in front of the baths, a piercing hammer mounted on the carriage for displacement vertically between raised and lowered positions and means responsive to the resistance to penetration of the hammer through the surface of the bath for initiating the operation of the piercing hammer to form an opening through the crust, a hopper on the carriage for the storage of alumina and means for discharging alumina from the hopper into the opening pierced by the hammer, said machine embodying sequencing and control means responsive to the position of the carriage relative to the baths and responsive to the position of the piercing hammer between raised and lowered positions adapted to (1) displace the carriage to a position in front of the anode of the bath to be fed, (2) lower the piercing hammer responsive to positioning of the carriage to pierce the crust to form an opening through the surface of the bath, (3) raise the piercing hammer from the bath, (4) displace the carriage a short distance responsive to movement of the hammer towards raised position, (5) pierce the bath again and continue the operation of steps (2), (3) and (4) until a number of openings have been provided in the surface of the bath, (6) feed aluminum from the hopper onto the surface of the bath, and (7) displace the machine to starting position.

3,372,107

ELECTRODE MATERIAL FOR ELECTROLYTIC PROCESSES

Alfred Klein, 1265 47th St., Brooklyn, N.Y. 11219

No Drawing. Continuation-in-part of application Ser. No. 278,421, May 6, 1963. This application Jan. 17, 1964, Ser. No. 338,327
8 Claims. (Cl. 204—291)

1. A composition of matter for use as an anode in electrolysis, comprising a mixture of 20% to 80% by weight of electrically conductive components, said conductive components being reactive metals and characterized by their possessing high chemical inertness to anodic oxidation and becoming passive when they are made anodic in salt solutions, from 10% to 40% by weight of an alkali metal silicate and from 10% to 60% by weight of lead monoxide.

3,372,108

CONVERTING NAPHTHENES TO AROMATICS AND SEPARATING THE AROMATICS

William R. Epperly, New Providence, and Charles W. Tyson, Jr., Westfield, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Filed July 25, 1966, Ser. No. 567,654
7 Claims. (Cl. 208—95)

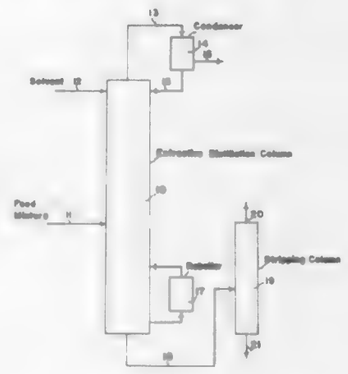
The present disclosure relates to a process for removing cyclic constituents such as cyclic paraffins and aromatics from fuels. The fuel is first subjected to a dehydrogenation step during which step the naphthenes are converted to aromatics. The fuel is then contacted with a molecular sieve which is adapted to selectively adsorb the aromatic compounds. The hydrogenation and adsorption steps may be combined in a single zone or carried out separately. Both the dehydrogenation catalyst and the adsorbent are periodically regenerated. In a preferred embodiment, ammonia is employed to both reactivate the catalyst and desorb the molecular sieve. The fuels obtained by this process exhibit improved luminometer numbers and are useful as jet fuels and in certain fuel cells.

3,372,109

HYDROCARBON SEPARATION WITH AN ALKOXYNITRILE SOLVENT

George D. Davis, Creve Coeur, and Earle C. Makin, Jr., St. Louis, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware

Filed Mar. 16, 1966, Ser. No. 534,869
8 Claims. (Cl. 208—313)



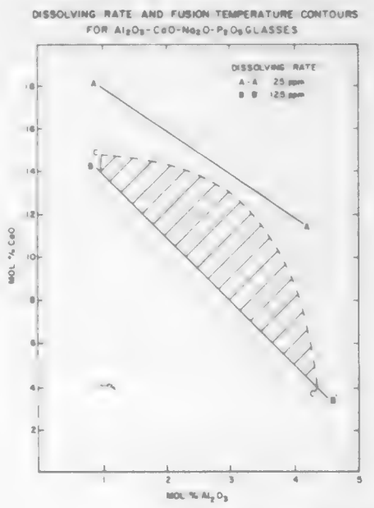
A process for the separation of mixtures of hydrocarbons of varying degrees of unsaturation by extractively distilling such mixtures in the presence of a solvent which comprises 75 to 99 percent by weight of an alkoxynitrile in which the alkyl radicals are straight chain and have one to three carbon atoms and 1 to 25 percent by weight of water, recovering an overhead distillate fraction from the extractive distillation which is substantially richer in hydrocarbons of lesser degree of unsaturation than the original mixture, removing a solvent fraction rich in the more unsaturated hydrocarbons of the original mixture from the distillation zone and recovering from such solvent fraction a fraction substantially richer in the more unsaturated hydrocarbons than said original mixture.

3,372,110

PROCESS OF SEQUESTERING METAL IONS WITH SLOWLY SOLUBLE PHOSPHATE GLASSES

Robert J. Fuchs, Clark, N.J., assignor to FMC Corporation, New York, N.Y., a corporation of Delaware

Original application Mar. 27, 1962, Ser. No. 182,870, now Patent No. 3,338,670, dated Aug. 29, 1967. Divided and this application June 13, 1967, Ser. No. 645,767
3 Claims. (Cl. 210—57)



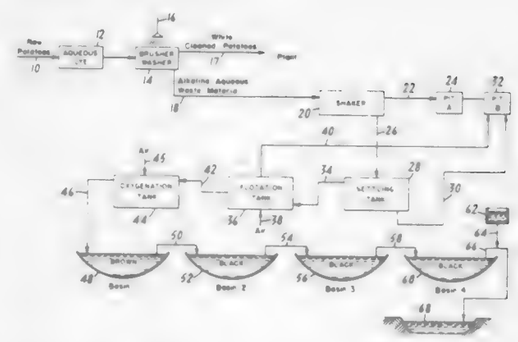
A novel class of polyphosphate glasses having a fushion temperature between about 1148° F. to about 1382° F. and a dissolving rate in water of from about 25 to about 125 mg./liter and containing about 46.5 to about 48.5 mole percent P_2O_5, about 35.5 to about 44.5 mole percent Na_2O, about 1 to 4.25 mole percent Al_2O_3 and about 4 to about 15 mole percent CaO has been found effective in sequestering calcium and iron ions present in water by adding the polyphosphate glass to water in concentrations of about 1 to about 125 p.p.m.

3,372,111

TREATMENT OF ALKALINE WASTES FROM POTATO PROCESSING

Frederick H. Vahlsing, Jr., Allentown, N.J., assignor to Vahlsing, Inc., a corporation of Delaware

Filed Feb. 21, 1966, Ser. No. 529,089
4 Claims. (Cl. 210—62)



Disagreeable odor, color and hazardous bacterial content of liquid alkaline waste material, generated by potato processing operations which include a lye peeling step, are eliminated by removing relatively large-sized suspended solids from the waste material, oxygenating the waste material, ponding the waste material at least once and adding chlorine to the waste material in a concentration from about 1 to about 20 parts per million by weight.

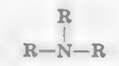
3,372,112

DRILLING FLUIDS HAVING ENHANCED LUBRICATING PROPERTIES

Harry W. Parker, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed May 14, 1964, Ser. No. 367,565
10 Claims. (Cl. 252—8.5)

1. A pumpable aqueous drilling fluid having enhanced lubricating properties consisting of water, from 1 to 15 weight percent of finely divided inorganic solids, and a small but effective amount, sufficient to provide said enhanced lubricating properties but insufficient to increase the viscosity of the drilling fluid to the extent that it cannot be readily pumped and circulated, of an amine selected from the group of amines having the formula



wherein: each R is selected from the group consisting of hydrogen, hydrocarbon radicals containing from 1 to 22 carbon atoms, amino substituted hydrocarbon radicals containing from 1 to 22 carbon atoms and also containing at least one $—NH_2$ substituent attached to a carbon atom other than a carbon atom which is alpha to a $—NH_2$ group, said hydrocarbon radicals wherein at least one $—CH_2—$ other than a $—CH_2—$ attached to a nitrogen atom is replaced with

and said amino substituted hydrocarbon radicals wherein at least one $-CH_2-$ other than a $-CH_2-$ attached to a nitrogen atom is replaced with

$$-\overset{H}{\underset{|}{N}}-$$

at least one R contains at least 8 carbon atoms, and the total number of nitrogen atoms in the molecule does not exceed 4; and mixtures of said amines; said amount of said amine being within the range of from 3 to 15 pounds per barrel of said fluid.

3,372,113
LUBRICATION OF METAL DURING HOT WORKING

Gerhard Naeser, Duisburg-Huckingen, Otto Wessel, Duisburg-Ungelsheim, and Kurt Darschewski, Duisburg-Huckingen, Germany, assignors to Mannesmann Aktiengesellschaft, Dusseldorf, Germany, a corporation of Germany

No Drawing. Filed Apr. 23, 1965, Ser. No. 450,544
12 Claims. (Cl. 252—12)

This invention relates to the lubrication of metal during the hot working thereof with a metal salt selected from alkali metal carbonates, alkali metal halides, and mixtures thereof which have been heat treated at a temperature which is at least that of the first critical point of transition of said salt.

3,372,114
PROCESS FOR PREPARING THICKENED MINERAL OIL COMPOSITIONS

Rudolph J. Rense, Gates Mills, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Feb. 25, 1965, Ser. No. 435,333
14 Claims. (Cl. 252—33)

Gelled materials useful as lubricant additives in greases are prepared by contacting (A) a fluid mineral oil solution of a carbonated, basic complex of an alkaline earth metal and an organic carboxylic or sulfonic acid, salt thereof, or carboxylic ester containing at least 12 aliphatic carbon atoms, the complex being characterized by a metal ratio of at least about 4.5, with (B) oxygen at a temperature of about 150° C. to about 300° C.

3,372,115
BASIC METAL-CONTAINING THICKENED OIL COMPOSITIONS

Richard L. McMillen, Painesville, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Continuation-in-part of application Ser. No. 185,521, Apr. 6, 1962, now Patent No. 3,242,079, dated Mar. 22, 1966. This application Mar. 21, 1966, Ser. No. 535,693
11 Claims. (Cl. 252—33)

1. A process for preparing a homogeneous thickened composition comprising mixing a fluid mineral oil solution of a carbonated basic alkaline earth metal salt of an acid having at least about 12 aliphatic carbon atoms and selected from the class consisting of sulfonic acids and carboxylic acids, said salt having a metal ratio of at least about 4.5 and from about 1% to about 80%, based on the weight of said metal salt, of an active hydrogen substance selected from the class consisting of alcohol:water mixtures wherein the weight ratio of alcohol to water varies up to 24:1 and is exclusive of ranges of ratios of about 0.5:1 to 3:1, the mixing being conducted at a temperature within the range of from about 25° C. up to the reflux temperature of said alcohol:water mixtures.

3,372,116
PREPARATION OF BASIC METAL PHENATES AND SALICYLATES

Norman A. Meinhardt, Lyndhurst, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Continuation-in-part of application Ser. No. 493,264, Oct. 5, 1965. This application Apr. 17, 1967, Ser. No. 631,144
20 Claims. (Cl. 252—36)

1. In the method for preparing a basic metal phenate by reacting, at a temperature between about 25° C. and the reflux temperature, (A) a hydrocarbon-substituted phenol having at least about 6 carbon atoms in the hydrocarbon substituent, a mixture of said phenol with up to an equivalent amount of a hydrocarbon-substituted succinic acid or anhydride having at least about 6 carbon atoms in the hydrocarbon substituent, or a substantially neutral alkali metal or alkaline earth metal salt of either of the foregoing, (B) about 1–10 equivalents, per equivalent of (A), of a calcium or strontium base, and (C) carbon dioxide;

the improvement which comprises carrying out the reaction in the presence of about 0.002–0.2 equivalent, per equivalent of said calcium or strontium base, of a carboxylic acid having up to about 100 carbon atoms or an alkali metal, alkaline earth metal, zinc or lead salt thereof.

3,372,117
COLD FORMING LUBRICANT

Frederick W. C. Jones and Edwin W. Goodspeed, Royal Oak, Mich., assignors to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York

No Drawing. Filed Nov. 26, 1965, Ser. No. 510,040
6 Claims. (Cl. 252—42.1)

A lubricant concentrate composition which comprises from about 3 to 75 percent by weight of an alkali metal orthophosphate, about 15 to 97 percent by weight of an alkali metal fatty acid soap, containing from about 8 to 22 carbon atoms, and at least 0.1 percent by weight of a surface active agent selected from the group consisting of anionic phosphate esters, non-ionic ethylene oxide condensates and amphoteric biodegradable surface active agents. Additionally, the concentrate composition may contain from about 0.1 to 80 percent by weight of a water dispersible diluent selected from water soluble and colloidally suspendable diluents, such as sugar and polyethylene glycol having a molecular weight from about 100 to 10,000. An aqueous lubricant composition containing from about 10 to 400 pounds of this concentrate per hundred gallons of solution may be used to form a lubricant coating on a chemically coated metal surface, such as a phosphate coated metal surface, which surface may then be deformed after the lubricant coating has been dried.

3,372,118
PROCESS FOR PREPARING BASIC ALKYL PHENOLIC COMPOSITIONS

Rudolph J. Rense, Gates Mills, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Dec. 7, 1965, Ser. No. 512,240
6 Claims. (Cl. 252—42.7)

Overbased derivatives of mixtures of alkylated phenols and polar compounds such as amines, amine-aldehyde condensation products, esters, alcohols and the like are prepared by mixing a metal base such as barium oxide or hydroxide with an oil solution of the phenol, removing most of the water in the mixture, adding the polar compound at about 125–175° C. and carbonating. This method avoids foaming and decomposition of the ingredients of the reaction mass. The products are useful as lubricant and fuel additives.

3,372,119
LUBRICANT COMPOSITIONS CONTAINING POLYCHLOROALKYL BENZENE EXTREME PRESSURE ADDITIVES

Bernard Demoures, 14 Quai Jayr, Rhone, Lyon, France, and Gérard Schneider, 119 Quai Clemenceau, Rhone, Caluire, France

No Drawing. Filed Mar. 9, 1965, Ser. No. 438,368
Claims priority, application France, Mar. 10, 1964, 966,777
4 Claims. (Cl. 252—48.8)

A lubricant additive for use at extreme pressures comprising a mixture of a chlorinated alkyl benzene having a chlorine content of from 50 to 75% by weight, at least 75% of which is bound to the alkyl carbon atoms, and a resinous polychlorobenzene polysulfide soluble in hydrocarbon oils and containing from 15 to 25% sulfur and from 44 to 55% chlorine.

3,372,120
LUBRICANTS CONTAINING POLYMERIC ADDITIVES

Lester E. Coleman, Cleveland, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Continuation-in-part of application Ser. No. 90,630, Feb. 21, 1961. This application May 15, 1967, Ser. No. 638,612
19 Claims. (Cl. 252—51.5)

Oils containing interpolymers of N-vinyl oxazolidones have improved viscosity-index properties, pour point properties, dispersancy properties, and resistance to the formation of insoluble degradation products. At least one oil-solubilizing vinyl co-monomer is required in the preparation of the interpolymers used in this invention. Additional oil-solubilizing vinyl co-monomers or other co-monomers may be used in making these interpolymers.

3,372,121
PIEZOELECTRIC AND ELECTROSTRICTIVE CERAMIC ARTICLES OF LEAD ZIRCONATE TITANATE CONTAINING MANGANESE AND TUNGSTEN OXIDES

Hisao Banno, Ueno-machi, Japan, assignor to NGK Spark Plug Co., Ltd., Nagoya, Japan

Filed Mar. 15, 1965, Ser. No. 439,676
14 Claims. (Cl. 252—62.9)

Piezoelectric and electrostrictive ceramic articles having a composition consisting essentially of $Pb(Zr\text{-}Ti)O_3$ or $PB(Zr\text{-}Sn\text{-}Ti)O_3$ wherein a part of Pb is replaceable by at least one alkaline earth element selected from the group consisting of Ba, Ca, Sr and Mg, and containing W and Mn to particularly improve mechanical Q of the ceramic articles which is especially important in their application to a ceramic wave filter, a mechanical wave filter and a piezoelectric tuning fork.

3,372,122
VANADIUM-CONTAINING LITHIUM FERRITES

Howard Lessoff, Needham Heights, Mass., assignor to Radio Corporation of America, a corporation of Delaware

Filed Aug. 13, 1964, Ser. No. 389,419
13 Claims. (Cl. 252—62.61)

Magnetic memory cores useful in computer applications comprise lithium ferrites with minor additions of vanadium. Optionally, manganese, cadmium zinc and/or magnesium may be present. The cores have square hysteresis loop and a high Curie temperature. The addition of vanadium imparts a shorter switching time and/or lower coercive force to the core. The cores are prepared by calcining in an oxidizing atmosphere a mixture of the constituent metal oxides or compounds which yield the constituent metal oxides on heating. The calcined mixture is then shaped to form a core which is sintered at temperatures between 930° C. and 1190° C. and then cooled.

3,372,123
METHOD FOR MANUFACTURING LITHIUM-NICKEL-MANGANESE FERRITE MAGNETIC MEMORY CORES

Cornelis Jacobus Esveldt, Evert Willem Gorter, and Hans Peter Peloschek, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Continuation of application Ser. No. 280,490, May 3, 1963. This application May 24, 1966, Ser. No. 552,631
Claims priority, application Netherlands, May 25, 1962, 278,942
4 Claims. (Cl. 252—62.61)

A method of manufacturing magnetic core elements, useful as storage elements, and having a rectangular hysteresis loop, in which a mixture of lithium, nickel, manganese, and ferric oxides, after calcining, is compacted into annular cores which are heated to between 1200° C. and 1400° C. for not more than ten minutes in a water-free atmosphere.

3,372,124
CORROSION INHIBITORS

Theodore E. Majewski, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Original application Apr. 21, 1965, Ser. No. 449,886, now Patent No. 3,318,909. Divided and this application Aug. 10, 1966, Ser. No. 615,270
7 Claims. (Cl. 252—77)

Aqueous glycol antifreeze compositions are rendered non-corrosive to metals by the inclusion of a small proportion of a 2-(cyclohexylimino)-1-hydrocarbyl-pyrrolidine.

3,372,125
DENTURE CLEANSER

William H. Hill, Stamford, Conn., assignor to Peter, Strong & Company, Inc., New York, N.Y.

No Drawing. Continuation-in-part of application Ser. No. 210,584, July 17, 1962. This application Nov. 15, 1965, Ser. No. 507,705
6 Claims. (Cl. 252—99)

1. A denture cleanser having a peroxy oxygen-liberating compound for evolving gas bubbles in an aqueous medium, and an activating agent having the radical consisting of $[Fe(CN)_y(NO)_z]$ in which the iron may be replaced by a metal selected from a group consisting of cobalt, nickel, manganese, and copper, and wherein $y=1$ to 6, and $z=0$ to 1, the said activating agent being present in amount sufficient to promote increased evolution and bubbling of gas.

3,372,126
PROCESS FOR PREPARING SPHEROIDAL FLUORINATING AGENTS CONTAINING CALCIUM FLUORIDE AND SUITABLE FOR FLUID-BEDS AND PRODUCT RESULTING THEREFROM

Martino Vecchio and Vittorio Fattore, Milan, and Italo Cammarata, Bollate, Milan, Italy, assignors to Montecatini Edison S.p.A., Milan, Italy, a corporation of Italy

Filed May 24, 1965, Ser. No. 458,048
Claims priority, application Italy, May 26, 1964, 11,702/64
16 Claims. (Cl. 252—182)

Process for the preparation of a spheroidal fluorinating agent containing calcium fluoride and calcium chloride, particularly suited for fluorination reactions conducted in fluid bed, comprising suspending calcium fluoride in an

aqueous solution of calcium chloride and thence subjecting the resultant suspension to simultaneous granulation and drying. Also, the spheroidal fluorinating agent resulting therefrom.

3,372,127
BORON-LOADED LIQUID SCINTILLATOR
George E. Thomas, Jr., Naperville, and Harold E. Jackson, Jr., Elmhurst, Ill., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed Feb. 12, 1965, Ser. No. 432,436
4 Claims. (Cl. 252—301.2)

A liquid scintillator which differentiates between radiation due to slow neutrons and gamma rays comprising a solvent of either toluene, xylene, mineral oil or isopropyl biphenyl containing 40 to 50 weight percent trimethyl borate and saturated with 9,10-diphenyl anthracene and naphthalene.

3,372,128
NOVEL CATALYST COMPOSITION
Shozo Maeda, Nishinomiya-shi, Ken Ito and Teruya Nishida, Toyonaka-shi, and Takashi Tamura, Osaka, Japan, assignors to Sumitomo Chemical Company, Ltd., Osaka, Japan, a corporation of Japan
No Drawing. Filed Jan. 23, 1964, Ser. No. 339,617
Claims priority, application Japan, Jan. 25, 1963, 38/3,691
2 Claims. (Cl. 252—437)

1. A catalyst which consists essentially of a member selected from bismuthmolybdate and bismuthphosphomolybdate, supported on 10–75% by weight, based upon the total weight of the catalyst, of diatomaceous earth.

3,372,129
METHOD OF PREPARING POLYAMINES
Kenneth G. Phillips, North Riverside, Ill., assignor to Nalco Chemical Company, Chicago, Ill., a corporation of Delaware
No Drawing. Filed Oct. 6, 1964, Ser. No. 401,964
10 Claims. (Cl. 260—2)

A process of making high molecular weight polyamines which are characterized as being substantially non-cyclic in structure.

3,372,130
CONTROL OF RATE OF RISE OF POLYURETHANE FOAMS WITH PHOSPHORIC ACID AND A TERTIARY AMINE
Samuel Chess, San Pedro, and Robert G. Pilmer, Palos Verdes Peninsula, Calif., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware
No Drawing. Continuation-in-part of application Ser. No. 397,026, Sept. 16, 1964. This application Mar. 2, 1967, Ser. No. 619,912
3 Claims. (Cl. 260—2.5)

The rate of foam rise in the preparation of polyurethane foams is controlled by employing as catalyst a combination of a tertiary amine and phosphoric acid; the amount of acid is less than required to neutralise the amine.

3,372,131
FIRE PROTECTING ADHESIVES COMPRISING DICYANDIAMIDE-ALDEHYDE CONDENSATION PRODUCT
Hans Adolf Rohlfs and Heinz Schmidt, Wiesbaden-Biebrich, and Karl Stumpp, Wiesbaden, Germany, assignors to Chemische Werke Albert, Wiesbaden-Biebrich, Germany, a corporation of Germany
No Drawing. Filed Mar. 31, 1964, Ser. No. 356,023
Claims priority, application Germany, Apr. 6, 1963, C 29,594; Feb. 21, 1964, C 32,215
19 Claims. (Cl. 260—17.3)

The invention relates to novel fire retardant adhesive compositions comprising an amine-aldehyde condensation product prepared by condensing an aminoplast forming compound comprising dicyandiamide and an aldehyde at least in part in the presence of phosphate ions and at least in part in the presence of ammonium ions, the phosphate ion component being present in an amount of at least 4.1% by the weight of the anhydrous amino-compound and the anhydrous aldehyde, and a method of forming fire-retardant adhesive bonds between two surfaces.

3,372,132
GRAFT POLYMERS OF CELLULOSE CRYSTALLITE AGGREGATES
Mamerto M. Cruz, Jr., Newtown Square, Pa., assignor to FMC Corporation, Philadelphia, Pa., a corporation of Delaware
No Drawing. Continuation-in-part of application Ser. No. 112,152, May 3, 1961. This application May 6, 1964, Ser. No. 365,508
14 Claims. (Cl. 260—17.4)

A free-flowing, particulate, sand-like graft copolymer of crystalline cellulose is formed by reacting cellulose crystallite aggregates having a level-off D.P. with a polymerizable monomer containing a doubly bonded methylene group. When molded by heat and pressure, the copolymer forms electrical insulators with excellent resistance to high humidity conditions. Translucent films are formed by dispersing the graft polymer in a non-solvent liquid and evaporating the liquid.

3,372,133
PROCESS FOR PRODUCING ORGANOPOLYSILOXANES
Karl W. Krantz, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
No Drawing. Filed June 23, 1965, Ser. No. 466,468
8 Claims. (Cl. 260—28)

Phenylsilsesquioxane polymers of high intrinsic viscosity are prepared by the suspension polymerization of lower molecular weight precursor materials in the presence of a high boiling aromatic solvent for both the precursors and the final materials and in the presence of controlled amounts of a high boiling aliphatic diluent which has a solvent attraction for the aromatic solvent but not towards the organopolysiloxanes. The resulting high intrinsic viscosity materials are useful as wire insulation, thin films, textile treating materials and the like.

3,372,134
REINFORCED SYNTHETIC RUBBER LATEX AND USES
Robert M. Pierson, Hudson, and Richard W. Hobson, Mitchell S. Kolaczewski, and Thomas H. Rogers, Jr., Akron, Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio
No Drawing. Filed June 1, 1964, Ser. No. 371,806
7 Claims. (Cl. 260—29.7)

1. In the process of preparing a synthetic rubbery polymeric latex by polymerizing a polymerizable conjugated diene monomer while dispersed in an aqueous emulsion system containing a micelle producing surfactant, and a free radical initiator, at a polymerization temperature of from about 40° F. to about 85° F. and forming a rubbery latex particle in which the monomer is soluble, in which sufficient surfactant is present in the water to form micelles to promote the conversion of monomer to polymer during at least up to 40% conversion of monomer to polymer and stabilize the resulting latex particles during said conversion period, but insufficient to prevent the surface tension of the system from increasing to a maximum value during polymerization and then decreasing to a minimum value during agglomeration when at least 45% of monomer has been converted to polymer, the improvement which comprises

adding a resinous latex selected from the group consisting of polystyrene and copolymers of styrene and a conjugated diene hydrocarbon to the system after the system has undergone a 10% conversion and before about a 40% conversion of monomer to polymer, continuing polymerization of the monomer to a conversion of from about 45% to about 70% and then treating the latex particles with agitation to cause agglomeration of the latex particles and a decrease of the surface tension and recovering the latex.

3,372,135
SILICONE VARNISH
Tamotsu Wada, Tokyo, and Mitsuo Ishizaka, Yokohama-shi, Japan, assignors to Tokyo Shibaura Electric Co., Ltd., Kawasaki-shi, Japan, a Japanese corporation
Filed Dec. 12, 1963, Ser. No. 330,155
Claims priority, application Japan, Dec. 13, 1962, 37/55,086
16 Claims. (Cl. 260—33.9)

Silicone varnish that may be dried at low temperatures and method of preparing the same comprising a silicone resin solution, and either a complex metal hydroxide having a metal atom such as Ni, Cu, Co, and Cr coordinated with amines or with both amines and water, or, a complex salt having the complex metal hydroxide reacted with an organic acid.

3,372,136
DISPERSED TETRAFLUOROETHYLENE - HEXAFLUOROPROPYLENE COPOLYMER BASED COATING COMPOSITIONS
Yutaka Kometani, Hyogo-ken, and Akira Yamada and Soichi Satoyama, Takatsuki-shi, Japan, assignors to Daikin Kogyo Kabushiki Kaisha, Osaka-shi, Japan, a juridical person of Japan
No Drawing. Filed Oct. 21, 1965, Ser. No. 500,364
13 Claims. (Cl. 260—33.8)

Coating compositions of a tetrafluoroethylene—hexafluoropropylene copolymer dispersed in a solution of a polymer containing chlorotrifluoroethylene dissolved in a flurine containing organic solvent.

3,372,137
PROCESS FOR PREPARING MINERAL REINFORCED POLYLACTAM COMPOSITIONS
Paul A. Tierney, St. Louis, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed June 3, 1964, Ser. No. 372,398
21 Claims. (Cl. 260—37)

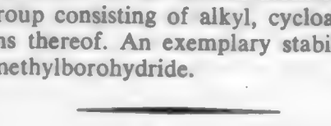
1. A process for preparing polylactam compositions comprising

(a) combining lactam monomer, basic lactam polymerization catalyst, lactam polymerization initiator, and inorganic material heat-pretreated at temperatures above about 375° C. for a time sufficient to remove surface hydroxyl group; and

(b) heating the mixture formed thereby at a temperature from about the melting point of said lactam up to about 250° C. for a time sufficient to cause polymerization.

3,372,138
PROCESS FOR COLORING SYNTHETIC LINEAR POLYESTERS
Francis Bowman, Albert Charles Cooper, and Francis Irving, Manchester, England, assignors to Imperial Chemical Industries Limited, London, England
No Drawing. Filed May 28, 1965, Ser. No. 459,914
Claims priority, application Great Britain, June 8, 1964, 23,599/64; Oct. 16, 1964, 42,323/64
7 Claims. (Cl. 260—40)

1. Process for the mass coloration of synthetic linear polyesters which comprises using as colouring matter at least one dyestuff of the formula:



wherein:

D is a dyestuff radical which is free from sulphonic acid groups and which is selected from the class consisting of anthraquinone, anthrapyridone, isothiazoloanthrone, anthrapyrimidine, anthrapyrimidone and phthaloylacridone dyestuff radicals;

Y, which is attached to a carbon atom of a benzene ring present in D, is selected from the class consisting of —S— and —NH—;

n is a positive integer not exceeding 2;

m is a positive integer not exceeding 4; and any further substituents on the benzene ring A are chlorine atoms, by mixing said dyestuff with the polyester, melting the resulting mixture, and spinning said mixture into fibers.

3,372,139
PREPARATION OF CROSS-LINKABLE POLYOLEFIN COMPOSITIONS
Erich Behr, Troisdorf, and Rolf Beckmann, Siegburg, Germany, assignors to Dynamit Nobel Aktiengesellschaft Troisdorf, Bezirk Cologne, Germany, a corporation of Germany
No Drawing. Filed Sept. 7, 1965, Ser. No. 485,575
Claims priority, application Germany, Sept. 8, 1964, D 45,368
11 Claims. (Cl. 260—41)

An additive, for example, carbon black, and a cross-linking agent, and a polyolefin polymer are combined in a mixture, preparatory to further treatment, such as for example cross-linking, by the steps of (1) heating a mixture of the additive and polyolefin to sinter the mixture, (2) cooling the sintered polymer, and (3) dispersing the cross-linking agent in the cooled sintered polymer.

3,372,140
STABILIZED OLEFIN POLYMERS
Donald R. Witt, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Filed Sept. 13, 1965, Ser. No. 487,060
11 Claims. (Cl. 260—45.9)

Polymers are stabilized with a compound having the general formula $M(BR_4)_y$ wherein M is ammonium, lithium, sodium, potassium, rubidium, cesium, beryllium, magnesium, calcium, strontium, or barium; *y* is the valence of M; and R is a 1 to 20 carbon atom radical selected from the group consisting of alkyl, cycloalkyl, aryl, and combinations thereof. An exemplary stabilizer is ammonium tetramethylborohydride.

3,372,141
SELF-EXTINGUISHING POLYSTYRENE RESIN COMPOSITIONS
Richard T. Dickerson and William F. Tousignant, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed Feb. 4, 1963, Ser. No. 256,109
7 Claims. (Cl. 260—45.95)

1. A self-extinguishing styrene polymer comprising the homopolymers and copolymers of monovinyl aromatic compounds containing no more than a minor amount of another monoethylenically unsaturated organic compound copolymerized therewith and containing from about 0.1 to about 5 percent by weight of a mixed bromine-containing alkenyl-aryl ether of: (1) a bromine-containing alkenyl compound wherein the hydrogen atoms on the olefinic carbon atoms in the alkenyl group have been replaced by bromine atoms and said alkenyl group contains

from 3 to 4 carbon atoms; and (2) triphenyl carbinol or a halogenated phenol.

3,372,142

EPOXIDATION PROCESS

Douglas R. Smith, Freeport, Tex., assignor to the Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Jan. 31, 1964, Ser. No. 341,782
5 Claims. (Cl. 260—47)

5. The process of epoxidizing a vicinal chlorohydrin compound by dehydrochlorinating said compound in the presence of an aqueous solution of between 1.5 and 5.5 N alkali metal hydroxide and substantially saturated with an alkali metal carbonate.

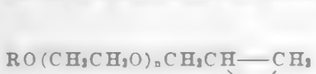
3,372,143

PROCESS FOR PRODUCING MODIFIED POLYESTERS WITH EPOXY ETHER COMPOUNDS

Hiroshi Terada, Ohtake-shi, Masao Ishii, Tokyo, and Makoto Yamada, Kazunari Tokuda, Osamu Nakagawa, Takeshi Imaida, and Shunichi Takashima, Ohtake-shi, Japan, assignors to Mitsubishi Rayon Co., Ltd., Tokyo, Japan, a corporation of Japan

No Drawing. Filed May 29, 1964, Ser. No. 371,182
Claims priority, application Japan, May 31, 1963, 38/28,436; June 12, 1963, 38/31,510
7 Claims. (Cl. 260—47)

A process for producing a fiber-forming modified polyester which comprises reacting terephthalic acid or its dimethyl ester, ethylene glycol and a compound having an epoxy group in the molecule and represented by the formula:



wherein R is an alkyl group having 1 to 18 carbon atoms, an aryl group, or an alkylaryl group and *n* is an integer of from 1 to 10, as a third component, alone or together with a compound having at least two epoxy groups in the molecule, in the same manner as in the production of unmodified polyesters. The resulting modified polyester has mechanical properties substantially the same as those of the unmodified polyester (polyethylene terephthalate) and can be formed into fibers or films having much superior dyeability with a disperse dyestuff.

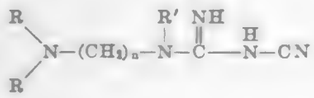
3,372,144

LOW TEMPERATURE AMINOALKYLDICYANDIAMIDE CURING AGENTS FOR EPOXY RESINS

Arnold Drucker, Stamford, Conn., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Jan. 25, 1966, Ser. No. 522,839
5 Claims. (Cl. 260—47)

1. A composition comprising (A) an organic polyepoxide material having a plurality of reactive 1,2 epoxy groups and (B) as a curing agent an amount of a substituted aminoalkyldicyandiamide having the structure:



wherein R represents a lower alkyl group of from 1 to 6 carbon atoms, R′ represents a substituent selected from the group consisting of hydrogen and benzyl and *n* is an integer from 2 to 10 inclusive.

3,372,145

PROCEDURE FOR CONTINUOUS MANUFACTURE OF POLYOXYMETHYLENE OF ULTRA-HIGH DEGREE OF POLYMERIZATION

Seizo Okamura and Toshinobu Higashimura, Sakyo-ku, Kyoto, Japan, assignors to Research Institute for Production Development, Sakyo-ku, Kyoto, Japan, a non-profit-making organization of Japan

Filed Jan. 7, 1964, Ser. No. 336,288
Claims priority, application Japan, Jan. 14, 1963, 38/1,859
6 Claims. (Cl. 260—67)

A process for the manufacture of ultra-high molecular weight polyoxymethylene including the steps of (1) polymerizing trioxane crystals suspended in an organic liquid containing a dissolved polymerization catalyst for less than about 5 minutes at a temperature between —20° C. and 60° C., (2) separating the catalyst solution from the solid monomer and polymer, (3) deactivating the polymerization after a conversion of about 10–20% by weight of the monomer, and (4) separating athe monomer from the polymer.

3,372,146

POLYACETAL TERPOLYMERS CONTAINING RANDOMLY RECURRING GROUPS DERIVED FROM A DICARBONAL

Henri Sidi, Paramus, N.J., assignor to Tenneco Chemicals, Inc., a corporation of Delaware

No Drawing. Filed Aug. 12, 1964, Ser. No. 389,196
11 Claims. (Cl. 260—67)

Certain isomeric dicarbonals may be copolymerized with formaldehyde or with its cyclic trimer, trioxane, to form a new class of polyacetal copolymers and terpolymers which contain randomly recurring groups derived from the isomeric dicarbonals. These new polyacetal copolymers and terpolymers are characterized by viscosimetrically-determined average molecular weights in the range from 10,000 to 100,000, and by excellent thermal and hydrolytic stability.

3,372,147

PRODUCTION OF THERMOSETTING AROMATIC-FORMALDEHYDE RESINS

Raymond L. Heinrich and John M. Powers, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N.J., a corporation of Delaware

Filed Dec. 21, 1964, Ser. No. 419,720
13 Claims. (Cl. 260—67)

Thermosettable resins of high oxygen content are produced by reacting an aromatic hydrocarbon and formaldehyde in the presence of an acid catalyst under specific conditions to produce a liquid hydrocarbon phase which is separated and subjected to neutralization and vacuum distillation under specific conditions to obtain a thermosettable resin as a bottoms product.

3,372,148

TEREPHTHALIC ACID-ALIPHATIC ACID COPOLYESTER RESINS

Maria V. Wiener, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Filed Feb. 12, 1963, Ser. No. 257,861
5 Claims. (Cl. 260—75)

1. A random ethylene glycol-neopentyl glycol terephthalate-aliphatic dicarboxylate copolyester in which the aliphatic dicarboxylate units are derived from an aliphatic dicarboxylic acid having the general formula

in which X is at least one member selected from the group consisting of hydrogen and alkyl radicals containing from

one to four carbon atoms and n is a positive integer not less than six, in which the glycol units in said copolyester consist essentially of units of ethylene glycol and neopentyl glycol, said ethylene glycol units constituting from 70 to 30 mol percent of the total number of mols of acid component in the copolyester, the neopentyl glycol units correspondingly constituting from 30 to 70 mol percent of the total number of mols of acid component in the copolyester, the terephthalic acid units comprise from 95 to 70 mol percent of the total number of mols of terephthalic acid and aliphatic dicarboxylic acid component in the copolyester and the aliphatic dicarboxylic acid units comprise from 5 to 30 mol percent of the total mols of terephthalic and aliphatic dicarboxylic acid component in the copolyester.

3,372,149

PROCESS FOR PREPARING SALTS OF AMINOALKYL ESTERS OF CARBOXYLIC ACID POLYMERS

Joseph Fertig, Elizabeth, Emil Daniel Mazzarella, Mountainside, and Martin Skoultchi, Somerset, N.J., assignors to National Starch and Chemical Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Continuation-in-part of applications Ser. No. 394,055, Sept. 2, 1964, and Ser. No. 561,749, June 30, 1966. This application May 19, 1967, Ser. No. 639,604

3 Claims. (Cl. 260—78.4)

This invention relates to a novel process for the preparation of a class of water soluble polymeric derivatives. More particularly, this invention relates to a novel process for preparing the water soluble acid salts of primary and secondary aminoalkyl esters of carboxylic acid polymers by means of the reaction, in an aqueous medium, between a carboxylic acid polymer and either a primary or a secondary alkyleneimine.

3,372,150

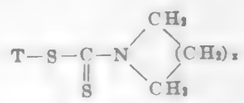
POLYMETHYLENE 2-BENZOTHIAZOLYL CARBODITHIOATES

John J. D'Amico, Dunbar, W. Va., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Original application Jan. 7, 1966, Ser. No. 519,300, now Patent No. 3,306,906, dated Feb. 28, 1967. Divided and this application Nov. 14, 1966, Ser. No. 593,728

3 Claims. (Cl. 260—79.5)

1. The process of vulcanizing a diene polymer rubber which comprises incorporating therein sulfur and an accelerating amount of a compound of the formula



where T is selected from the group consisting of benzothiazolyl, nitro-, chloro-, lower alkyl-, and lower alkoxy-substituted benzothiazolyl, and x is an integer at least 5 but less than 7 and heated at a vulcanizing temperature.

3,372,151

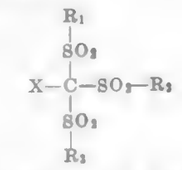
PROCESS FOR POLYMERIZATION USING SALTS OF ALKYL TRISULFONYLMETHANES (TSM'S) AS EMULSIFIERS

Clyde Stephen Scanley, Stamford, Conn., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Continuation-in-part of application Ser. No. 324,259, Nov. 18, 1963. This application Dec. 21, 1964, Ser. No. 420,134

5 Claims. (Cl. 260—86.1)

A suspension or emulsion polymerization process in which the emulsifying agent is a substituted trisulfonylmethane of the formula:



wherein X is a cation, R_1 is the functional group $-C_nH_{2n}-Z-C_mH_{2m+1}$ with Z being methylene, phenylene, naphthylene, cyclohexylene, or oxy, provided that $n+m$ is from 4 to 21, further provided that when Z is oxy, n is at least 1, and R_2 and R_3 each are lower alkyl, phenyl, tolyl, cyclohexyl or R_1.

3,372,152

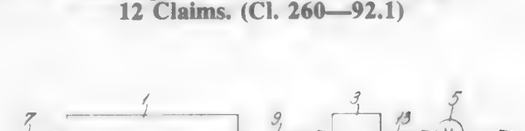
EPOXY RESINS FROM HALOGEN-SUBSTITUTED, UNSATURATED ALCOHOLS

Morton H. Litt, Morristown, and George J. Schmitt, Madison, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Original application Dec. 5, 1961, Ser. No. 157,270, now Patent No. 3,324,187. Divided and this application Apr. 6, 1967, Ser. No. 646,782

2 Claims. (Cl. 260—91.3)

1. A fluorine-substituted, epoxy resin prepared by the interaction of epichlorohydrin with a dihydric, fluorine-substituted, olefinic alcohol having the general formula



wherein R_3 is a member selected from the group consisting of alkyl, cycloalkyl, aryl, aralkyl, alkoxy and aryloxy, R_1 is a member selected from the group consisting of hydrogen, alkyl, cycloalkyl, aryl, aralkyl, alkoxy, halogen, amide, acyl, carboalkoxy, vinyl and allyl, X is a member selected from the group consisting of chlorine and fluorine, the total number of chlorine atoms represented by X ranging from 0 to 4, m is an integer ranging from 0 to 1, n is an integer ranging from 0 to 20 and p is an integer ranging from 0 to 1.

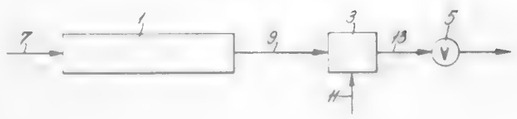
3,372,153

POLYMER POWDERS AND PROCESS THEREFOR

Andrew Turner and Edgar W. Wise, South Charleston, W. Va., assignors to Union Carbide Corporation, a corporation of New York

Filed Apr. 9, 1965, Ser. No. 446,916

12 Claims. (Cl. 260—92.1)

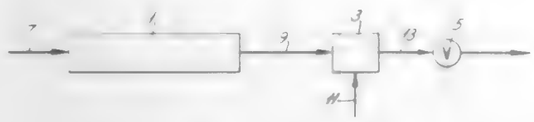


1. In a process for producing a powdered polymer of an olefinically-unsaturated monomer comprising polymerizing said monomer in contact with a free-radical initiator in a reaction zone at elevated pressure followed by withdrawing the polymerization product from the reaction zone and reducing the pressure of said polymer product to about atmospheric pressure, the improvement of subsequent to said polymerization and prior to said pressure reduction admixing said polymerization product with a lower monohydric alkanol of from 1 to 6 carbons in an amount sufficient to promote the formation of polymer particles of reduced size.

3,372,154
ETHYLENE POLYMER POWDERS AND PROCESS THEREFOR

Andrew Turner and Edgar W. Wise, South Charleston, W. Va., assignors to Union Carbide Corporation, a corporation of New York

Filed Apr. 9, 1965, Ser. No. 446,917
4 Claims. (Cl. 260—94.9)



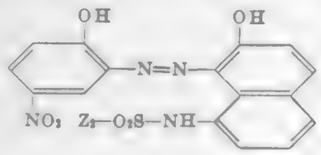
4. In a process for producing a powdered ethylene polymer comprising polymerizing ethylene in contact with a free-radical initiator in a reaction zone at elevated pressure followed by withdrawing the polymerization product from the reaction zone and reducing the pressure of said polymer product to about atmospheric pressure, the improvement of subsequent to said polymerization and prior to said pressure reduction admixing said polymerization product with ethylene having a temperature of at least 100° C. below that of the reaction zone in an amount of at least 10 weight percent of the total weight of monomer fed to said reaction zone.

3,372,155
MIXED CHROMIUM COMPLEX MONOAZO DYESTUFFS

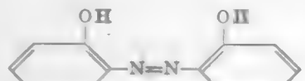
Gerhard Dittmar, Leverkusen, and Walter Scholl, Cologne-Mulheim, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Feb. 26, 1964, Ser. No. 347,386
Claims priority, application Germany, Feb. 28, 1963, F 39,137
2 Claims. (Cl. 260—145)

1. A mixed chromium complex azo dyestuff which contains in complex union one atom of chromium and two molecules of different monoazo dyestuffs of the formulae:



and



wherein Z_1 stands for methyl, ethyl, or phenyl, and Z_2 stands for methyl, ethyl, phenyl, or p-methylphenyl.

3,372,156
IMPROVING THE SOLUBILITY OF HIGH-MOLECULAR WEIGHT SUBSTANCES BY DIALDEHYDE POLYSACCHARIDE TREATMENT

Franz Schwarzer, Wiesbaden, and Hans Macholdt, Wiesbaden-Biebrich, Germany, assignors to Kalle Aktiengesellschaft, Wiesbaden-Biebrich, Germany, a corporation of Germany

No Drawing. Filed Aug. 27, 1964, Ser. No. 392,631
Claims priority, application Germany, Aug. 30, 1963 K 50,689
12 Claims. (Cl. 260—232)

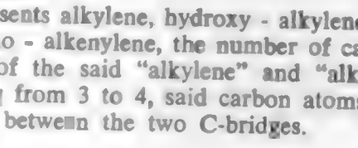
This invention relates to a process for improving the solubility of a macromolecular carbohydrate and derivatives thereof and polyvinyl alcohol and derivatives thereof and to a compound of such improved solubility, the process comprising treating the compound at an elevated temperature with a dialdehyde polysaccharide in a quantity of about 0.1 to 10 percent by weight.

3,372,157
6-AMINO-PENICILLANIC ACID DERIVATIVES

Peter Baumann, Frenkendorf, Basel-Land, Markus Zimmermann, Riehen, and Franz Häfliger, Basel, Switzerland, assignors to Geigy Chemical Corporation, Greenburgh, N.Y., a corporation of Delaware

No Drawing. Continuation-in-part of applications Ser. No. 252,593, Jan. 21, 1963, Ser. No. 263,421, Mar. 7, 1963, Ser. No. 263,422, Mar. 7, 1963 and Ser. No. 442,529, Mar. 24, 1965. This application July 8, 1965, Ser. No. 470,604
Claims priority, application Switzerland, Jan. 26, 1962, 977/62; Mar. 9, 1962, 2,878/62, 2,879/62; Jan. 4, 1963, 66/63; Mar. 6, 1963, 2,854/63, 2,855/63; Sept. 4, 1964, 11,560/64
42 Claims. (Cl. 260—239.1)

1. A compound of the formula



wherein

A is a member selected from the group consisting of the radicals of the formulas

each of R_1, R_2 and R_3 represents alkylene, lower alkyl-alkylene, hydroxy - alkylene, oxo - alkylene, lower alkoxy-alkylene, chloro - alkylene, bromo - alkylene, chloro-lower alkyl - alkylene, bromo - lower alkyl - alkylene, exo - methylene - alkylene or alkenylene, the number of carbon atoms of "alkylene" and "alkenylene" in the said definitions of R_1, R_2 and R_3 being from 2 to 4, said carbon atoms being ring members between the two C-bridges,

R_4 represents hydrogen, lower alkyl, halogen, or phenyl,

R_5 represents alkylene of from 2 to 3 carbon atoms,

Y_1 represents hydrogen, lower alkyl, hydroxyl or lower alkoxy,

Y_2 represents hydrogen or lower alkyl,

Y_1 and Y_2 when taken together represent oxo,

R_2'' represents alkylene, lower alkyl - alkylene, hydroxy-alkylene, oxo - alkylene or lower alkoxy - alkylene, the number of carbon atoms of "alkylene" in the said definitions of R_2'' being from 3 to 4, said carbon atoms being ring members between the two C-bridges,

R represents hydrogen or a cation, the salt of which falling under the above formula is pharmaceutically acceptable, and

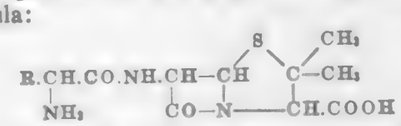
$R_2°$ represents alkylene, hydroxy - alkylene, oxo-alkylene or oxo - alkenylene, the number of carbon atoms of each of the said "alkylene" and "alkenylene" of $R_2°$ being from 3 to 4, said carbon atoms being ring members between the two C-bridges.

3,372,158
PROCESS FOR THE PREPARATION OF PENICILLINS

Brian William Hatt, Redhill, and Harry Smith, Maplehurst, near Horsham, England, assignors to Beecham Group Limited, Brentford, England, a British company

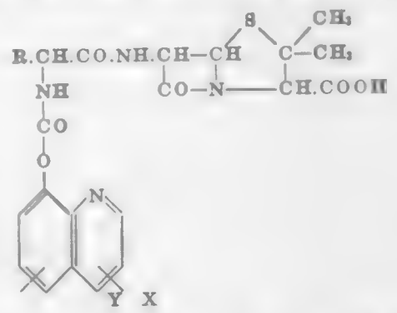
No Drawing. Filed Mar. 4, 1966, Ser. No. 531,738
Claims priority, application Great Britain, Mar. 18, 1965, 11,464/65
2 Claims. (Cl. 260—239.1)

1. In a process for the preparation of penicillins of the formula:



(I)

and physiologically acceptable non-toxic salts thereof, wherein R is phenyl, the improvement which comprises treating an N-protected penicillin of the formula:



(II)

wherein R is as hereinbefore defined and X and Y are the same or different and are each hydrogen, halogen, lower alkyl or lower alkoxy with a salt of a heavy metal in aqueous or partly aqueous solution at a pH between 1 and 7.

3,372,159
NOVEL 3-SPIROLACTONE, STEROIDS OF THE ANDROSTANE SERIES AND METHODS OF PRODUCING SAID COMPOUNDS

Oswald Auguste de Bruin, Van Houtenlaan, Weesp, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Nov. 12, 1965, Ser. No. 507,531
Claims priority, application Netherlands, Nov. 14, 1964, 64—13,306
8 Claims. (Cl. 260—239.57)

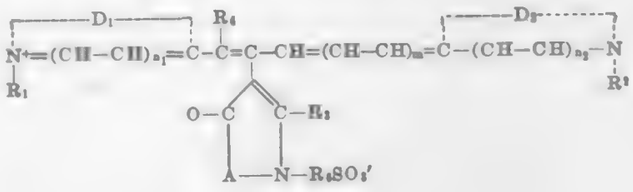
Condense γ bromo cis-crotonic acid esters or β-alkoxy derivatives thereof with 3-keto-androstanes to produce a 3-spirolactone of the androstane series, for example 3-ethoxy-4(5'α-androstane-3'β,17' - diol - 3'-yl-17-acetate)-but-2-ene-acid lactone. The compounds have anti-(endogenic)-estrogenic activities. This abstract is not intended to be a description of the invention defined by the claims.

3,372,160
CYANINE DYES

Geoffrey Ernest Ficken, Ilford, Essex, England, assignor to Ilford Limited, Ilford, England, a British company

No Drawing. Filed May 6, 1964, Ser. No. 365,521
Claims priority, application Great Britain, May 17, 1963, 19,755/63
8 Claims. (Cl. 260—240.1)

1. A cyanine dye selected from the class consisting of dyes of the formula:



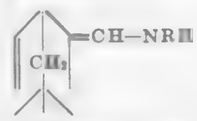
wherein R_1 and R_2 are each alkyl lower groups, R_3 is selected from the class consisting of hydrogen and lower alkyl, phenyl and naphthyl or phenyl and naphthyl substituted by alkyl, amino, hydroxy, alkoxy and oxyalkyl groups or halogen atoms, and benzyl or naphthylmethyl, and furyl or pyridyl groups, R_4 is selected from the class consisting of hydrogen and alkyl groups, R_5 is selected from the class consisting of straight and branched chain saturated divalent alkylene groups of from 2 to 6 carbon atoms, A is selected from the class consisting of oxygen and $—NR_8$ wherein R_8 is selected from the class consisting of hydrogen and lower alkyl, phenyl and naphthyl or phenyl and naphthyl substituted by alkyl, amino, hydroxy, alkoxy and oxyalkyl groups or halogen atoms, and benzyl or naphthylmethyl, and furyl or pyridyl groups, D_1 and D_2 complete ring systems selected from the class consisting of benzothiazole, benzoxazole, benzoselenazole, thiazole, thiazoline, quinoline and indole, and n_1, n_2 and m are each selected from nought and one.

3,372,161
POLYCYCLICAMINOSULFONES

Leo A. Paquette, Columbus, Ohio, assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Continuation-in-part of application Ser. No. 308,690, Sept. 13, 1963. This application Oct. 16, 1963, Ser. No. 316,520
10 Claims. (Cl. 260—247.1)

Enamines of the formula,



wherein NRR is a cyclic amino group, are condensed with methane or chloromethanesulfonyl chloride to give polycyclicaminosulfones of the formula

The unsaturation can be removed by hydrogenation and/or the free base can be converted to acid addition salts, N-oxides, N-oxide acid addition salts, and alkyl quaternary ammonium salts.

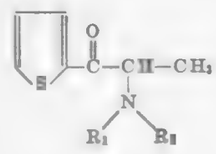
3,372,162
1-(2-THIENYL)-1-OXO-2-AMINO PROPANES

Marcel Pesson, Paris, and Suzanne Geiger, born Berschandy, Neuilly-sur-Seine, France, assignors to Societe anonyme dite: Laboratoire Roger Bellon, Neuilly-sur-Seine, Seine, France, a French company

Filed July 3, 1964, Ser. No. 380,187
Claims priority, application Great Britain, July 4, 1963, 26,642/63
11 Claims. (Cl. 260—247.1)

5. 1-(2'-thienyl)-1-oxo-2-N-morpholinopropane.

11. A 1-(2'-thienyl)-1-oxo-2-amino propane compound selected from the group consisting of a 1-(2'- thienyl)-1-oxo-2-amino propane of the formula



wherein:

R_1 and R_2 are members selected from the group consisting of hydrogen, lower alkyl having from 1 to 4 carbon atoms, benzyl, and

R_1 and R_2 together with the nitrogen atom to which they are attached form a morpholine, pyrrolidine, piperidine, piperazine, 4-lower alkyl substituted piperazine, and 4-hydroxy lower alkyl substituted piperazine rings each of said lower alkyls having from 1 to 4 carbon atoms,

or its pharmaceutically acceptable acid addition salts.

3,372,163

PROCESS FOR THE PREPARATION OF LINEAR QUINACRIDONE IN THE FORM OF RED PIGMENTS

Marco Tessandori, Milan, Italy, assignor to Aziende Colori Nazionali Affini ACNA S.p.A., Milan, Italy, a corporation of Italy

No Drawing. Continuation-in-part of application Ser. No. 374,276, June 11, 1964. This application May 10, 1966, Ser. No. 548,846

5 Claims. (Cl. 260—279)

1. A process for the preparation of quinacridone in the gamma form as a red pigment characterized by a crystalline X-ray diffraction pattern showing bands corresponding to the θ angles of 6.5°, 13.1°, 13.3°, 13.7°, 17.0°, 20.5°, 23.8°, 25.0° and 26.4° which process comprises treating crude quinacridone having crystals of a size not greater than 2 microns, at least 90% of said crystals being in the alpha form, with about 10 to 100 parts by weight per part of said crude quinacridone of dimethylsulfoxide at a temperature ranging from about room temperature to the boiling point of the dimethylsulfoxide and recovering said gamma form of quinacridone.

3,372,164

BENZENESULFONYL SEMICARBAZIDES

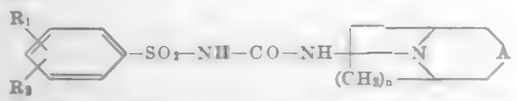
Erich Haack, Heidelberg, and Ruth Heerdt and Kurt Stach, Mannheim, and Felix H. Schmidt, Mannheim-Neuostheim, Germany, assignors to C. F. Boehringer & Soehne G.m.b.H., Mannheim-Waldhof, Germany, a corporation of Germany

No Drawing. Filed Aug. 25, 1964, Ser. No. 392,041

Claims priority, application Germany, Sept. 3, 1963, B 73,366

9 Claims. (Cl. 260—292)

A novel class of chemical compounds characterized by blood sugar reducing activity is disclosed. The compounds and their alkali metal, alkaline earth metal and ammonium salts are characterized by the following formula for the free base



in which R_1 and R_2 are selected from the group consisting of hydrogen, halogen, alkyl, alkenyl, alkoxy, alkenoxy, alkylmercapto, acyl, azido, and trifluoromethyl; A is selected from the group consisting of methylene ($>CH_2$), carbonyl ($>CO$) and hydroxymethylene ($>CHOH$) which can be etherified or esterified and n is 1 or 2.

3,372,165

1,2,3,4,5,6 - HEXAHYDRO - 8 - HYDROXY - 2,6 - METHANO-3-BENZAZOCINE DERIVATIVES

Sydney Archer, Bethlehem, N.Y., assignor to Sterling Drug Inc., New York, N.Y., a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 72,844, Dec. 1, 1960. This application Nov. 23, 1962, Ser. No. 239,777

18 Claims. (Cl. 260—294.7)

1,2,3,4,5,6 - hexahydro-3-(Y-lower alkylene-)-6-(R^1)-11-(R^2)-8-(R^3-O-)-2,6-methano-3-benzazocines wherein Y is halo-alkenyl, cyano, cyano-lower alkenyl, or cycloalkyl, R^1 is hydrogen or lower alkyl, R^2 is hydrogen, methyl, or ethyl, and R^3 is a member of the group consisting of hydrogen, methyl, and, when Y is other than cycloalkyl, the further members lower alkanoyl and pyridinecarbonyl, have pharmacodynamic activity and are useful as antagonists of certain strong analgesic agents, such as morphine and meperidine. The preferred species, 1,2,3,4,5,6-hexahydro-3 - cyclopropylmethyl-6,11 - dimethyl - 8 - hydroxy-2,6-methano-3-benzazocine, also has muscle relaxant and anticonvulsant properties and is useful as a non-addicting strong analgesic.

3,372,166

BENZOXAZOLONES AND BENZOTHIAZOLONES

William J. Houlihan, Mountain Lakes, N.J., assignor to Sandoz Inc., Hanover, N.J.

No Drawing. Continuation-in-part of application Ser. No. 379,749, July 1, 1964. This application Feb. 23, 1967, Ser. No. 617,823

4 Claims. (Cl. 260—304)

The compounds are 4a - substituted - isoindolo[1,2-b] benzoxazol- (and benzothiazol-)11-ones which are useful as sedatives and tranquilizers. They are prepared by reacting an o-acylbenzoic acid with an o-aminophenol (or thiophenol).

3,372,167

PREPARATION OF WATER SOLUBLE SULFUR VAT DYES

Jan Jacobus Anthonius Moll, Vlaardingen, Netherlands, assignor to Fabriek Van Chemische Producten Vondelingen-plaat N.V., Rotterdam, Netherlands, a corporation of Dutch law

No Drawing. Filed Nov. 29, 1963, Ser. No. 327,097

Claims priority, application Netherlands, Nov. 29, 1962, 286,138

10 Claims. (Cl. 260—315)

1. A process for the preparation of water soluble sulfur vat dyes which comprises treating the sulfur vat dye to remove electrolytes until the amount of electrolytes present in the dye is reduced below about 5 percent by weight and converting the treated sulfur vat dye to the water soluble form by contacting with a salt of sulfurous acid.

3,372,168

10,10-LOWER ALKYL-9-[1-LOWER ALKYL-PYRROLIDINES (3)] - 9,10 - DIHYDRO - ANTHRACENES AND 9-HYDROXY DERIVATIVES THEREOF

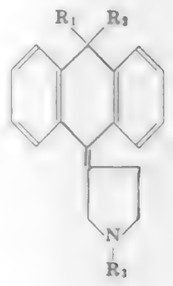
Ernst Jucker, Ettingen, Anton Ebnöther, Reinach, Basel-Land, and Andre Stoll, Birsfelden, Switzerland, assignors to Sandoz Ltd., Basel, Switzerland

No Drawing. Filed June 2, 1965, Ser. No. 460,838

Claims priority, application Switzerland, July 7, 1964, 8,912/64

6 Claims. (Cl. 260—326.5)

Compounds of formula



in which R_1, R_2 and R_3 are an alkyl radical containing between 1 and 3 carbon atoms and their acid addition salts, are useful as antidepressants. The dosage is 10–200 mg. per day orally, that is, 0.15–3 mg./kg. of body weight.

3,372,169

PREPARATION OF DIPHENYLMALEIC ANHYDRIDE AND DIPHENYLMALEIC ANHYDRIDE DIMER

John H. Fager, Cross River, N.Y., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Mar. 29, 1966, Ser. No. 538,237

7 Claims. (Cl. 260—346.3)

A method of preparing diphenylmaleic anhydride dimer by reacting phenylacetic anhydride and an aromatic amine N-oxide in an inert solvent in the presence of light. The diphenylmaleic anhydride dimer produced therefrom is also novel. The invention also covers a method of preparing diphenylmaleic anhydride by reacting phenylacetic anhydride and an aromatic amine N-oxide in an inert solvent.

3,372,170

SULFATION USING AMIDOSULFONIC ACID IN AN INERT SOLVENT

Hermann Remy, West Warwick, R.I., assignor to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Oct. 16, 1964, Ser. No. 404,504

Claims priority, application Germany, Oct. 29, 1963, F 41,130

3 Claims. (Cl. 260—372)

There is disclosed herein a method for the preparation of the blue acid dyestuff 1-amino-2-sulfonic acid-4-[2'-R-5'-(β - sulfato-ethylsulfonyl)anilino]anthraquinone, in which R represents hydrogen or the group —COOH, by reacting 1 - amino-2-sulfonic acid-4-[2'-R-5'-(β-hydroxy-ethylsulfonyl)anilino]anthraquinone with amidosulfonic acid at an elevated temperature in the presence of an inert organic solvent.

3,372,171

SULFATION USING AMIDOSULFONIC ACID IN AN INERT SOLVENT

Hermann Remy, West Warwick, R.I., assignor to Farbwerke Hoechst Aktiengesellschaft vormals Meister, Lucius & Bruning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Nov. 22, 1965, Ser. No. 509,180

Claims priority, application Germany, Dec. 2, 1964, F 44,585

3 Claims. (Cl. 260—374)

There is disclosed herein a method for the preparation of the blue acid dyestuff 1-amino-2-sulfonic acid-4-[2'-methoxy - 5' - (β - sulfato-ethylsulfonyl)-anilino]-anthraquinone by reacting 1 - amino - 2 - sulfonic acid-4-[2'-methoxy - 5' - (β-hydroxy-ethylsulfonyl)-anilino]-anthraquinone with amidosulfonic acid at an elevated temperature in the presence of an inert organic solvent.

3,372,172

PREPARATION OF 2,5-DIACYLAMINO-3,6-DIAMINO-1,4-BENZOQUINONES

Erhardt Winkelmann, Wolf-Helmut Wagner, and Manfred Schorr, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Dec. 12, 1963, Ser. No. 329,956

Claims priority, application Germany, Dec. 20, 1962 F 38,617

7 Claims. (Cl. 260—396)

Preparation of 2,5-diacylamino-3,6-diamino-1,4-benzoquinones by reacting the corresponding 3,6-dimethoxybenzoquinones with dry ammonia in an anhydrous, polar solvent.

3,372,173

SELENO-SUBSTITUTED STEROID COMPOUNDS

Albert Segaloff, Metairie, and Richard Bruce Gabbard, New Orleans, La., assignors to the United States of America

No Drawing. Filed June 3, 1965, Ser. No. 461,213

17 Claims. (Cl. 260—397.3)

Steroid compounds having a seleno-substituent at the 3-position, which exhibit androgenic activity, and a method of making the same. In the method, a 3-hydroxy-steroid is converted to its p-toluenesulfonate ester in any convenient manner such as by reaction with p-toluenesulfonyl chloride in the presence of an acid acceptor. The p-toluenesulfonate ester is then refluxed with selenourea to produce a steroidal selenopseudourea salt of p-toluenesulfonic acid. The steroidal selenopseudourea salts are hydrolyzed in basic solution and oxidized to diselenides or stabilized as an ester by a Schotten-Baumann recation. The specific steroids used were dehydroepiandrosterone and pregnenolone.

3,372,174

PROCESS FOR CONVERTING 17α-HYDROPEROXY-20-KETO-PREGNANES INTO THE CORRESPONDING 17-KETO-ANDROSTANES

John B. Siddall and John A. Edwards, Palo Alto, Calif., assignors to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed June 24, 1965, Ser. No. 466,810

Claims priority, application Mexico, July 8, 1964, 77,969

11 Claims. (Cl. 260—397.3)

Process for the preparation of 17-ketoandrostanes from corresponding 17α-hydroperoxy-20-ketopregnanes by treating the latter with hydroxide or oxido of an alkaline or alkaline-earth metal or a lower alcoholate of an alkaline metal or a hydride or amide of an alkaline metal.

3,372,175

19-NOR-14β,17α-PREGNANE DERIVATIVES AND PROCESS

John H. Fried, Palo Alto, Calif., assignor to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed Nov. 1, 1965, Ser. No. 505,995

6 Claims. (Cl. 260—397.4)

17β - hydroxy - 19 - nor - 14β,17α - pregn - 4 - ene-3,20-dione, 3β,17β - dihydroxy - 19 - nor - 14β,17α-pregn-4-ene-20-one, and the 3- and/or 17β-esters thereof, which are optionally substituted at the C–6 position with a chloro or fluoro group and/or at the C–18 position with a methyl group, and/or which are optionally unsaturated between the C–6 and C–7 position, are progestational agents and fertility control agents.

3,372,176

ALLYL, HALOALKYL METAL COMPOUNDS

Frank F. Roselli, San Mateo, Calif., assignor to Diamond Shamrock Corporation, a corporation of Delaware

No Drawing. Original application Apr. 15, 1963, Ser. No. 272,882, now Patent No. 3,299,173, dated Jan. 17, 1967. Divided and this application Aug. 29, 1966, Ser. No. 590,129

10 Claims. (Cl. 260—429.5)

Compounds of the formula $(R^1O)_aM(OR^2)_b$ wherein M is selected from the group consisting of antimony, titanium, silicon, arsenic, tin, lead and bismuth; R^1 is an allyl radical; R^2 is a 2,3-dihalopropyl radical; a and b are integers from 1 to 4, inclusive; and $a+b$ is an integer from 3 to 5, are prepared by reacting a stoichiometric amount of halogen with an unsaturated ester of the formula $(R^1O)_{a+b}M$ e.g. triallyl antimonite. The unsaturated ester may be prepared by reacting the corresponding alcohol with a metal halide. The halogenation reaction is

preferably carried out in an inert solvent. These compounds are useful as fire-retardant additives in curable polyesters. The olefinic group of the additives participate in the polymerization with the result that the fire-retardant agent is an integral part of the cross-linked resin matrix.

3,372,177
PHENYLTOLOXAMINE ALUMINUM PAMOATE

Edmund Stanley Granatek, Baldwinsville, N.Y., assignor to Bristol-Myers Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Aug. 17, 1964, Ser. No. 390,204
1 Claim. (Cl. 260—448)

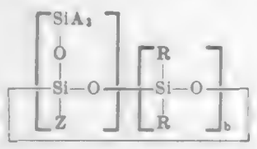
1. Phenyltoloxamine aluminum pamoate.

3,372,178
ARYL-VINYL CONTAINING LINEAR DISILOXANES AND TRI- AND TETRACYCLOSILOXANES

Tse C. Wu, Waterford, N.Y., assignor to General Electric Company, a corporation of New York

No Drawing. Filed Mar. 4, 1965, Ser. No. 437,287
10 Claims. (Cl. 260—448.2)

1. A cyclopolysiloxane having the formula:



where A is an aryl radical, R is an aryl radical, Z is selected from the class consisting of hydrogen and vinyl groups, and *b* is an integral number of from 2 to 3, inclusive.

8. The triarylsiloxysilane:

$$(C_6H_5)_3SiOSiViCl_2$$

3,372,179
S-SUBSTITUTED-β-MERCAPTOTHIOLBUTYRATES

Ferdinand B. Zienty, Warson Woods, and Alfred A. Schleppnik, St. Louis, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed July 15, 1965, Ser. No. 472,329
11 Claims. (Cl. 260—455)

Alkyl or aryl esters of S-substituted-β-mercapto thiolbutyric acid. These compounds are useful for various biological applications such as herbicides, insecticides.

3,372,180
PROCESS FOR THE PRODUCTION OF HYDROCARBYL 2,4-DIHYDROCARBYL ALLOPHANATES AND THIOLALLOPHANATES

Henri Ulrich, North Branford, Conn., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Filed Oct. 22, 1965, Ser. No. 502,398
18 Claims. (Cl. 260—455)

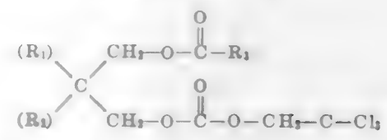
1. A process for the preparation of a compound selected from the class consisting of hydrocarbyl 2,4-dihydrocarbyl allophanates and hydrocarbyl 2,4-dihydrocarbyl thiolallophanates which comprises reacting at a temperature of about 20° C. to about 125° C. approximately stoichiometric proportions of the appropriate hydrocarbyl isocyanate and a compound selected from the class consisting of hydrocarbyl N-hydrocarbylcarbamates and hydrocarbyl N-hydrocarbyl thiolcarbamates in the presence of about 0.01% to about 5% by weight of carbamate of an alkali metal derivative of a compound having the formula RXH wherein R is lower-hydrocarbyl and X is selected from the class consisting of O and S.

3,372,181
CARBONATES AND CARBAMATES OF 2,2-DIALKYL - 1,3 - PROPANEDIOL-(2,2,2-TRICHLOROETHYLCARBONATE)

Joseph V. Swintosky, Perkiomenville, Pa., assignor to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Filed Aug. 24, 1965, Ser. No. 482,272
4 Claims. (Cl. 260—463)

1. A chemical compound of the formula:



in which:

R_1 is methyl or ethyl,

R_2 is a lower alkyl group having from two to four carbon atoms, and

R_3 is $-O-CH_2-C-Cl_3$, NH_2 or NHR_4, R_4 being a lower alkyl group having from one to four carbon atoms.

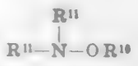
3,372,182
PROCESS FOR PREPARATION OF STABLE, FREE RADICAL NITROXIDES

Arthur Kentaro Hoffmann, New Canaan, Conn., Ernestine Gelb'um Abraham, Cumberland, Md., and Allan Murry Feldman, Norwalk, Conn., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

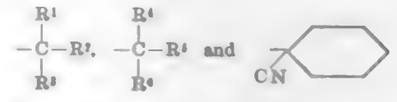
No Drawing. Filed Apr. 27, 1965, Ser. No. 451,315
6 Claims. (Cl. 260—465.5)

1. A process for preparing stable, free radical nitroxides of the formula:

which comprises pyrolyzing in an inert reaction medium a hydroxylamine of the formula:



wherein R^{10} is selected from the group consisting of



wherein:

R^1, R^2 and R^3 are alkyl;

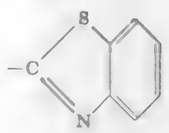
R^4 and R^5 are selected from the group consisting of alkyl, phenyl and halogen-substituted phenyl;

R^6 is selected from the group consisting of —CN, —$COOR^7$, —$CONH_2$, halogen, —SR^8 and —OR^9;

R^7 is selected from the group consisting of alkyl and phenyl;

R^8 is selected from the group consisting of —CN, —$COCH_3$, phenyl,

and



and

R^9 is selected from the group consisting of —$COCH_3$ and —COC_2H_5;

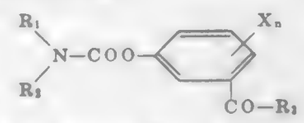
and wherein R^{11} is selected from the group consisting of R^{10} and phenyl.

3,372,183
META-ACYLPHENYL CARBAMATES

Camille Cottin, Lyon, and Jacques Mocotte, Champagne-au-Mont-d'Or, France, assignors to Progil, Paris, France

Filed Apr. 24, 1964, Ser. No. 362,220
Claims priority, application France, Apr. 25, 1963, 932,596
13 Claims. (Cl. 260—471)

The present disclosure relates to carbamic esters of the following general formula



wherein R_1 and R_2 are the same or different and include hydrogen atoms, alkyl, alkenyl, cycloalkyl, cycloalkylene, aryl, or alkyl radicals, or both members of a heterocyclic ring; R_3 is an alkyl radical; X is an electronegative group such as a halogen or the nitro group; and *n* is an integer of 0–4. These carbamic esters have general biocidal properties including bactericidal and fungicidal properties; they have good activity against sea molluscs and nematodes and are excellent insecticides. The carbamates may be used as powders, suspensions, solutions, or emulsions. They may be applied by spraying, coating or impregnating articles or materials therewith.

3,372,184
PRODUCTION OF DIALKYL 2,5-DIARYLAMINO-3,6-DIHYDROTEREPHTHALATES

Albert Murphy Auster, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed May 12, 1964, Ser. No. 366,917
8 Claims. (Cl. 260—471)

A process for preparing a dialkyl 2,5-diarylamino-3,6-dihydroterephthalate by condensing an arylamine with a dialkyl succinylsuccinate in an inert reaction medium in the presence of a salt or the arylamine and trifluoroacetic acid.

3,372,185
MANGANOUS BENZOATE AS AN ESTER INTERCHANGE CATALYST

William L. Hergenrother, Akron, Ohio, assignor to The Firestone Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Filed May 19, 1965, Ser. No. 457,185
8 Claims. (Cl. 260—475)

1. In a process for the formation of a polymerizable glycol ester of an aromatic dicarboxylic acid in a prepolymer composition for high molecular weight poly(alkylene aromatic dicarboxylate) by an ester interchange reaction between an alkyl monohydric alcohol ester of said dicarboxylic acid and an alkylene glycol, the improvement which comprises heating said alkyl monohydric alcohol ester of said dicarboxylic acid with an excess of an alkylene glycol in the presence of a catalytic amount of manganous benzoate, and removing the resulting monohydric alcohol from the reaction mass.

3,372,186
MANGANESE CHLORIDE TETRAHYDRATE AS AN ESTER INTERCHANGE CATALYST

William L. Hergenrother, Akron, Ohio, assignor to The Firestone Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Filed June 1, 1965, Ser. No. 460,477
8 Claims. (Cl. 260—475)

1. In a process for the formation of a polymerizable glycol ester of an aromatic dicarboxylic acid in a prepolymer composition for high molecular weight poly(alkylene aromatic dicarboxylate) by an ester interchange reaction between an alkyl monohydric alcohol ester of said dicarboxylic acid and an alkylene glycol, the improvement which comprises heating said alkyl monohydric alcohol ester of said dicarboxylic acid with an excess of an alkylene glycol in the presence of a catalytic amount of manganese chloride tetrahydrate and removing the resulting monohydric alcohol from the reaction mass.

3,372,187
METHOD OF MANUFACTURING VINYL ACETATE

George B. Karnofsky, Pittsburgh, Pa., assignor to Blaw-Knox Company, Pittsburgh, Pa., a corporation of Delaware

Original application Nov. 19, 1962, Ser. No. 238,514, now Patent No. 3,172,733, dated Mar. 9, 1965. Divided and this application Nov. 16, 1964, Ser. No. 411,252
7 Claims. (Cl. 260—498)

1. In the method of manufacturing vinyl acetate monomer by the known method wherein glacial acetic acid and acetylene are introduced into a reactor, the products of which are unreacted acetylene, unreacted acetic acid, vinyl acetate and other condensable side reaction components and wherein such reactor products are subsequently separated in a system comprising a succession of distillation columns in one of which vinyl acetate is stripped from said products and from the final one of which rectified acetic acid is obtained and wherein the unreacted acetylene and rectified acetic acid are recycled to the reactor, the herein-defined process wherein low temperature refrigeration for condensation of the reactor vapor prior to distillation is eliminated, comprising the steps of:

(a) introducing all of the reactor products in vapor and gaseous form into an absorption column interposed between the reactor and the distillation system,

(b) withdrawing a part of the unreacted acetic acid from the distillation system only after the vinyl acetate has been stripped therefrom but before it has been completely rectified and transferring the remaining part of the unrectified acetic acid to the distillation system immediately following the location at which the vinyl acetate has been removed from the distillation system,

(c) introducing the part of the acetic acid so withdrawn into the absorption column as a liquid in a flow countercurrent to the reaction products and absorbing therein condensable components from the reactor,

(d) controlling the temperature within the absorption column substantially throughout its length by indirect cooling to a generally uniform level below 100° F. and above 40° F., and

(e) passing the acetic acid with all of the absorbed components from the absorption column into the distillation system.

3,372,188
SULFOXIDATION PROCESS IN THE PRESENCE OF SULFUR TRIOXIDE

Terence G. Alston, Los Angeles, and William D. Schaeffer, Pomona, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed Mar. 12, 1965, Ser. No. 439,441
4 Claims. (Cl. 260—503)

The invention comprises the use of sulfur trioxide in the sulfoxidation of paraffin hydrocarbons to produce normal alkane sulfonic acids where are useful as biodegradable surfactants. The process comprises contacting a paraffin with sulfur dioxide, oxygen and sulfur trioxide at temperatures between about 20 and 100° C. and sufficient pressures to maintain liquid phase conditions. The reaction

is initiated in the presence of a free radical initiator which can be ultraviolet light, peroxides or azo compounds. The sulfur trioxide functions to maintain activity of the reaction without the continuous addition of a free radical forming material thereto.

3,372,189

PROCESS FOR SYNTHESIZING UREA

Eiji Otsuka and Kazumichi Kanai, Fujisawa, and Sadashi Chikaoka, Yokohama, Japan, assignors to Toyo Koatsu Industries, Incorporated, Tokyo, Japan, a corporation of Japan

Filed May 24, 1965, Ser. No. 457,914
Claims priority, application Japan, May 26, 1964, 39/29,335
5 Claims. (Cl. 260—555)

1. Method of eliminating carbon dioxide from an ammonia synthesizing raw material gas containing hydrogen, nitrogen and carbon dioxide and utilizing said eliminated carbon dioxide in the manufacture of urea, comprising the steps of introducing said gas into the lower portion of a washing zone maintained at a pressure of at least about 150 kg./cm.^{2} and passing said gas upwardly through said zone, introducing an absorbent comprising an aqueous solution containing carbon dioxide and ammonia at a temperature less than about 100° C. into the upper portions of said zone and passing it downwardly through said zone in countercurrent contact with said gas to absorb the carbon dioxide in said gas and form an absorbate, collecting said absorbate in the lower portions of said zone, maintaining the composition of said absorbate collected in said lower portions at 2.0 to 3.6 mols ammonia per mol of carbon dioxide by feeding ammonia into the lower portion of said zone while maintaining the temperature of said absorbate at 120 to 180° C., removing said gas freed of carbon dioxide from the upper portions of said zone and passing it to an ammonia synthesis reactor, and removing said absorbate from the lower portions of said zone, adjusting the pressure and temperature thereof to a presure and temperature suitable for urea synthesis and thereafter passing same to a urea synthesis reactor to form an aqueous solution of urea, unreacted carbon dioxide and unreacted ammonia.

3,372,190

PROCESS FOR THE PREPARATION OF TETRACYCLINE HYDROCHLORIDE FROM TETRACYCLINE BASE

George Krsek, Los Angeles, Orville Lowe, Long Beach, and Jerome Murray, San Gabriel, Calif., assignors to Rachelle Laboratories, Inc., a corporation of California

No Drawing. Filed Oct. 23, 1964, Ser. No. 406,176
8 Claims. (Cl. 260—559)

Tetracycline hydrochloride is prepared in high yield from tetracycline base by reacting successive portions of the base in 2-isopropoxy ethanol in such a manner that the reaction mixture initially contains an excess of base over acid, and at the end of the addition, an excess of acid is added to the base. By this means virtually total reaction is ensured and degradation of the base by excess acid minimized.

3,372,191

NITROGENOUS AND FLUORINATED CYCLOALKANES AND CYCLOALKENES AND PREPARATION THEREOF

Harry F. Smith, and Joseph A. Castellano, Wayne, N.J., assignors to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware

No Drawing. Filed Sept. 27, 1965, Ser. No. 491,506
20 Claims. (Cl. 260—563)

1. Fluoraminated compositions selected from the group consisting of bis(difluoramino)cycloalkenes, bis(difluoramino)alkylated cycloalkenes, tetrakis(difluoramino) cycloalkanes and tetrakis(difluoramino)alkylated cycloalkanes, said cycloalkanes and cycloalkenes having from 5 to 10 carbon atoms in the alicyclic ring.

3,372,192

PREPARATION OF FLUORINE-GUANIDINES AND BI-GUANIDES

Claude E. Merrill, Lancaster, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed June 25, 1964, Ser. No. 379,436
7 Claims. (Cl. 260—564)

1. A process for preparing fluorine and nitrogen containing organic compounds which comprises;

(a) providing an aqueous solution having a solute member selected from the group consisting of guanidine salts and biguanide, the guanidine salt solute member being selected from the group consisting of guanidine carbonate, guanidine sulfate and guanidine phosphate,

(b) contacting a flowing liquid film of said solution with fluorine thereby to prepare fluorinated products of the corresponding solute member of said aqueous solution, and

(c) recovering said fluorinated products.

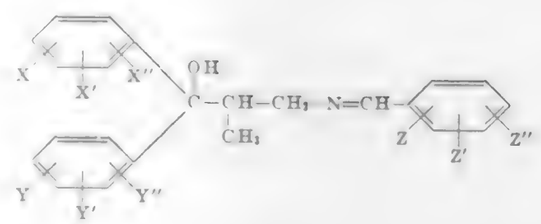
3,372,193

1,1-DIARYL-2-METHYL-3-(BENZYLIDENE-AMINO)PROPAN-(1)-OLS

Robert B. Moffett, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Filed June 1, 1966, Ser. No. 554,304
2 Claims. (Cl. 260—566)

1. A componnd of the formula



wherein X, X′, X″, Y, Y′, Y″, Z, Z′, and Z″ are members selected from the group consisting of hydrogen; alkyl containing from 1 to 4 carbon atoms, inclusive; alkoxy containing from 1 to 4 carbon atoms, inclusive; and halogen.

3,372,194

QUATERNARY BENZYLAMMONIUM SALTS

Bent Preben Arnkjaer, Glostrup, Steen Hove Antonsen, Lyngby, and Hans Otto Andersen, Virum, Denmark, assignors to Aktieselskabet Alfred Benzon, Copenhagen, Denmark, a firm

No Drawing. Filed Feb. 16, 1966, Ser. No. 433,199
Claims priority application, Denmark, Feb. 17, 1964, 757/64
6 Claims. (Cl. 260—567.6)

Quaternary benzyl ammonium salts having pronounced preventive effect against development of gastric ulcers, of the same order of magnitude as atropine and other anticholinergic compounds which are widely used in the treatment of gastric ulcers but free from the anticholinergic effect of atropine and like compounds.

3,372,195

REDUCTION OF NITRILES TO PRIMARY AMINES

John C. Little, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed May 4, 1964, Ser. No. 364,750
15 Claims. (Cl. 260—570.7)

Primary amines are made by hydrogenating a nitrile to its corresponding primary amine at a temperature between 0° and 200° C. and a pressure between 500 and 2000 p.s.i.g. wherein the reaction is carried out in the presence of at least 5 moles of ammonia per equivalent of nitrile and a catalytic amount of ruthenium.

3,372,196

5-(3-METHYL-AMINOPROPYL)-5H-DIBENZO [a,d]-CYCLOHEPTENE

Edward L. Engelhardt, Gwynedd Valley, Pa., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Original application July 25, 1963, Ser. No. 297,710. Divided and this application Nov. 25, 1966, Ser. No. 619,083
1 Claim. (Cl. 260—570.8)

5 - (3 - methylaminopropyl) - 5H - dibenzo [a,d]-cycloheptene which is useful as an anti-depressant and serves as a mood elevator or psychic energizer.

3,372,197

ISOMERIZATION OF DISUBSTITUTED CYCLOHEXANONES

Francis Johnson, Newton Lower Falls, Mass., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Dec. 11, 1964, Ser. No. 417,765
7 Claims. (Cl. 260—586)

1. The process for converting a disubstituted cyclohexanone having one and only one substituent in the 2-position, each substituent being alkyl, alkoxy, alkylthio, aryl, aryloxy or arylthio, from a more stable to a less stable cis-trans isomer comprising

(1) reacting by contacting the cyclohexanone with a member selected from the group consisting of dialkylamines, pyrrolidine, piperidine and morpholine to produce the corresponding enamine and

(2) hydrolyzing the enamine in an aqueous medium at a pH of not more than 6 and a temperature of not more than 100° C.

3,372,198

VINYLATION OF ORGANIC COMPOUNDS

Norbert F. Cywinski, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Continuation-in-part of application Ser. No. 150,648, Nov. 7, 1961. This application Apr. 18, 1963, Ser. No. 273,815
4 Claims. (Cl. 260—597)

1. A process for the production of a ketone from one of acetylene and an alpha-acetylene containing 3–5 carbon atoms to the molecule which comprises reacting at least one of said acetylenes with a ketone having 3–15 carbon atoms to the molecule, said ketone having at least one hydrogen atom attached to at least one of the carbon atoms attached to the ketone group, in the presence of a chemical-free radical initiator at a pressure sufficient to maintain the liquid phase.

3,372,199

PROCESS FOR THE PRODUCTION OF HYDROCINNAMALDEHYDE

Paul N. Rylander, Newark, and Nathan Himselstein, Hillside, N.J., assignors to Engelhard Industries, Inc., Newark, N.J., a corporation of Delaware

No Drawing. Filed Mar. 20, 1964, Ser. No. 353,615
1 Claim. (Cl. 260—599)

Aryl aldehydes having alpha, beta olefinic bonds, such as cinnamaldehyde, are hydrogenated to the corresponding aralkyl aldehyde using palladium catalyst and an iron promoter. The method provides the desired aldehydes under appropriate conditions to the virtual exclusion of corresponding alcohols.

3,372,200

TETRAORGANOBORON-PHOSPHORUS COORDINATION COMPLEX COMPOUNDS

Charles J. Stern, Jr., Westfield, and Edward G. Budnick, Scotch Plains, N.J., assignors to Plains Chemical Development Co., Roselle, N.J., a corporation of New Jersey

No Drawing. Continuation-in-part of application Ser. No. 47,943, Aug. 8, 1960. This application Oct. 23, 1964, Ser. No. 406,145
8 Claims. (Cl. 260—606.5)

1. A hexavalent boron-phosphorus containing coordination complex having a formula selected from the group consisting of $(R_1)_3B{\cdot}P(R_2)_3$ and $(R_4)_3B{\cdot}P(R_3)_3$ where R_1 is a hydrocarbyl group containing 4 to 10 carbon atoms, R_2 is alkyl, R_3 is monocyclic carbocyclic aryl and R_4 is alkyl.

3,372,201

ALKOXYLATION OF SECONDARY ALCOHOLS

Robert E. Leary, Somerville, Louis J. Nehmsmann III, Warren, Leslie M. Schenck, Mountainside, and John M. Walts, Clark, N.J., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed June 17, 1966, Ser. No. 558,280
5 Claims. (Cl. 260—615)

1. In a process for producing secondary alcohol polyalkylene glycol ethers, having from 1 to 5 ether linkages, by reacting a secondary alkanol having from 6 to 20 carbon atoms, with an alkylene oxide at a temperature of about 30° to about 150° C. in the presence of a catalytic amount of BF_3 catalyst; the improvement comprising employing as said catalyst a BF_3/trialkylphosphate complex wherein each alkyl contains about 1 to 12 carbon atoms or a BF_3/triarylphosphate complex wherein the aryl groups are monocyclic.

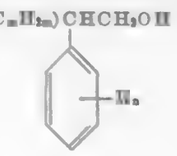
3,372,202

PREPARATION OF ar-HALOPHENETHYL ALCOHOLS

Chester E. Pawloski, Bay City, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Mar. 5, 1964, Ser. No. 349,763
8 Claims. (Cl. 260—618)

1. A process for making an ar-halophenethyl borate which comprises reacting by contacting the borate ester of an alcohol of the formula



wherein R is lower alkyl, *m* is 0–4, and *n* is 0–2, in the liquid phase at 0–200° C. with 0.5–1.5 equivalents of a halogenating agent selected from the group consisting of chlorine, bromine, bromine chloride, sulfuryl chloride, and N-bromosuccinimide.

3,372,203
REMOVAL OF IMPURITIES FROM ALCOHOLS BY EXTRACTION WITH SUGAR
Jerry W. Wimberley, Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
No Drawing. Filed Oct. 1, 1964, Ser. No. 400,877
10 Claims. (Cl. 260—643)

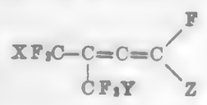
The odor level of alkyl sulfates prepared by sulfating aliphatic alcohols contaminated with odor precursors is improved by contacting said alcohols with sugar prior to sulfating.

3,372,204
PROCESS FOR PREPARATION OF 1-PHENYL-HEPTAFLUOROCYCLOPENTENE
Maurice Stacey, Robert Stephens and John Colin Tatlow, Edgbaston, Birmingham, England, assignors to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York
No Drawing. Filed May 5, 1966, Ser. No. 547,775
4 Claims. (Cl. 260—650)

1. A process for the preparation of 1-phenylheptafluorocyclopentene which comprises reacting 0.5 to 3 moles of 1-bromoheptafluorocyclopentene with 0.5 to 3 moles of bromobenzene and 5 to 10 moles of copper bronze at an elevated temperature in the range of about 200 degrees centigrade to about 300 degrees centigrade.

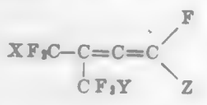
3,372,205
FLUORINATED ALLENES AND PROCESS FOR PREPARING SAME
Robert E. A. Dear, Convent Station, and Everett E. Gilbert, Morristown, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York
No Drawing. Filed Dec. 22, 1966, Ser. No. 603,735
16 Claims. (Cl. 260—653.3)

1. As new compositions of matter, the fluorinated halomethyl butadienes of the formula:

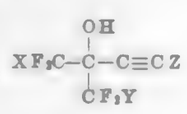


wherein X and Y are the same or different members of the group consisting of hydrogen, fluorine and chlorine, Z is hydrogen or chlorine, and when both X and Y are hydrogen, Z is also hydrogen.

9. The process for preparing fluorinated halomethyl butadiene compounds of the formula:



wherein X and Y are the same or different members of the group consisting of hydrogen, fluorine and chlorine, Z is a member of the group consisting of hydrogen and chlorine and when X and Y are both hydrogen, Z is also hydrogen; which comprises contacting a halomethyl-3-butyne-2-ol of the formula:

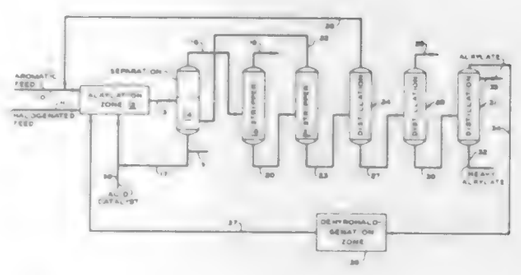


wherein X and Y and Z are as defined above, with a quantity of sulfur tetrafluoride at least about molecularly equivalent to the butyne-ol, at temperatures between about 0° C. and about 30° C. for a period of at least about 2 hours.

3,372,206
PROCESS FOR THE CYCLIZATION OF BUTADIENE-1,3
Roy L. Pruett, Charleston, and William R. Myers, St. Albans, W. Va., assignors to Union Carbide Corporation, a corporation of New York
No Drawing. Filed Mar. 16, 1964, Ser. No. 352,359
9 Claims. (Cl. 260—666)

Process for producing the trimer of butadiene-1,3 which is prepared by inter-reacting butadiene-1,3 with a diaryl manganese compound. The trimer of butadiene-1,3 is useful in the manufacture of reagents.

3,372,207
ALKYLATION PROCESS
Thomas Hutson, Jr., Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed July 10, 1964, Ser. No. 381,773
6 Claims. (Cl. 260—671)



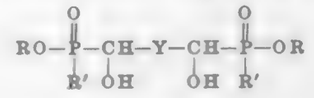
Paraffins are halogenated to a mixture of primary and secondary monohaloalkanes. This mixture is passed to an alkylation zone where an aromatic hydrocarbon is alkylated using a catalyst such as HF. The effluent comprising unreacted primary monohaloalkanes, catalyst, and alkylate product is withdrawn from said alkylation zone and passed to a separation system wherein the catalyst is separated from the hydrocarbon; said unreacted primary monohaloalkanes are separated from the alkylate product and passed through a dehydrohalogenation zone wherein they are converted to 1-olefins. The 1-olefin effluent from this dehydrohalogenation zone is recycled to said alkylation zone wherein said 1-olefins are reacted with the aromatic hydrocarbon to produce additional alkylate.

3,372,208
FLAME RESISTANT EPOXY RESINS CONTAINING PHOSPHORUS AND A HALOGEN
Rolland M. Waters, Beltsville, Md., and John C. Smith, Houston, Tex., assignors to Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed Mar. 20, 1964, Ser. No. 353,571
7 Claims. (Cl. 260—830)

This application discloses and claims a flame retardant thermosettable epoxy resin consisting essentially of a polyepoxypolyhalophosphonate produced by first forming an adduct by reacting (a) at least 3 moles of a polyepoxide containing more than one 1,2-epoxy group per molecule with (b) one mole of a phosphorus trihalide followed by a rearrangement of that adduct by a heat treatment.

3,372,209
DIPHOSPHORUS ESTER HYDROCARBON DIOLS
Gail H. Birum, Kirkwood, and Rodney B. Clampitt, St. Louis, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed Aug. 24, 1964, Ser. No. 391,726
18 Claims. (Cl. 260—932)

Phosphorus hydrocarbon diols of the formula



are useful as reactive flame retarding components in polymers such as polyesters, polyurethanes and polyethers. In the foregoing formula each R is an alkyl of 1 to 12 carbon atoms or a chloroalkyl or bromoalkyl of 2 to 12 carbon atoms while each R′ is an alkyl or alkoxy having 1 to 12 carbon atoms or chloroalkoxy or bromoalkoxy having 2 to 12 carbon atoms or phenyl and Y is alkylene having 2 to 10 carbon atoms or phenylene. The new diols are produced by reacting a dialdehyde with a phosphite or phosphonite ester and water or a non-oxidizing mineral acid or mixtures of the two at a temperature from about —25 to about 125 degrees centigrade.

3,372,210
O,O-DILOWERALKYLPHOSPHORODITHIOMETHYL-(POLY) CHLOROPHENOXYACETATES
Arnold D. Gutman, Oakland, and Thomas L. Snell, Hayward, Calif., assignors to Stauffer Chemical Company, New York, N.Y., a corporation of Delaware
No Drawing. Filed Sept. 23, 1964, Ser. No. 398,762
5 Claims. (Cl. 260—951)

Compounds having the general formula:

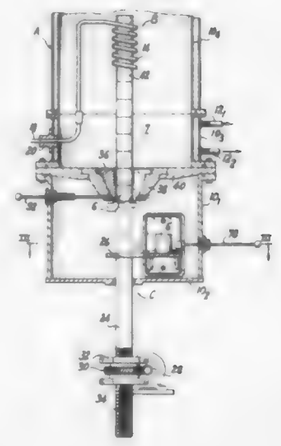
wherein R and R^1 are lower alkyl, X is selected from the group consisting of hydrogen and halogen, preferably chlorine, and *n* is an integer from 1 to 5, inclusive. The compounds are particularly effective as herbicides in the control of grasses and broadleaf plants with both pre-emergence and post-emergence activity. Typical compounds are O,O - dimethyl - phosphorodithioylmethyl-p-chlorophenoxyacetate, O,O - dimethylphosphorodithioylmethyl-2,4,5-trichlorophenoxyacetate and O,O - diisopropylphosphorodithioylmethyl-p-chlorophenoxyacetate.

3,372,211
METHOD FOR MANUFACTURING ORGANOPHOSPHORUS PEROXIDE COMPOUNDS
Nickolai Kirillovich Bliznjuk, Moscow, and Alexei Filippovich Kolomiets and Sergei Georgievich Zhemchuzhin, Moskovskaja Oblast, U.S.S.R., assignors to Vsesojuzny Nauchno-Issledovateisky Institute Fitopatologii
No Drawing. Filed May 7, 1964, Ser. No. 365,821
3 Claims. (Cl. 260—985)

A method for manufacturing organophosphorus peroxide compounds in which hydrogen peroxide is reacted with an organophosphorus compound selected from the group consisting of phosphates, and phosphonates of the formula: $R—P(O)(OR')_2$, wherein R is selected from the group consisting of CH_3, $(CH_3)_2NCH_2$, OH, and R″O, wherein R″ is alkyl having 2 to 4 carbon atoms; and R′ is alkyl having 2 to 8 carbon atoms.

The organophosphorus peroxide compounds are useful as initiators of polymerization reactions of vinyls and also as herbicides, fungicides, insecticides, and bleaching agents.

3,372,212
PROCESS FOR PRODUCING DENSIFIED AND ELONGATE BODIES
Bernard Gayet and Jean Holder, Ballancourt, France, assignors to Commissariat à l'Energie Atomique, Paris, France
Filed Nov. 3, 1964, Ser. No. 408,584
Claims priority, application France, Nov. 6, 1963, 952,795
4 Claims. (Cl. 264—.5)



Elongate bodies are formed of cylindrical elements having the cross-section of the body with the elements stacked in end to end relationship. The elements are moved through an induction coil to melt the central part of each element and the elements are then cooled bonding the elements together into an elongated body.

3,372,213
METHOD OF MANUFACTURING OXIDE NUCLEAR FUEL CONTAINING A BORIDE
Atsushi Nishiyama, Kawachi, and Toshio Kasamatsu, Nishinomiya, Japan, assignors to Sumitomo Electric Industries, Ltd., Osaka, Japan, a company of Japan
Filed Dec. 11, 1964, Ser. No. 417,719
Claims priority, application Japan, Dec. 16, 1963, 38/67,386, 38/67,387
5 Claims. (Cl. 264—.5)

1. A method of manufacturing nuclear fuel material having prolonged fuel life which comprises the steps of mixing the powder of oxide nuclear fuel with the powder of at least one of TiB_2, ZrB_2, CrB_2, NbB_2 and VB_2, compacting the mixture under a compacting pressure of at least 3 T./cm.^{2}, and sintering the compacted mixture at a temperature of at least 1,500° C. in a high degree of vacuum of at least 10^{-3} mm. Hg.

3,372,214
METHOD OF DIELECTRICALLY HEAT-MOLDING EPOXY RESINS
Stephen D. Marcey, Dayton, Ohio, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland
No Drawing. Continuation of application Ser. No. 284,004, May 29, 1963. This application Mar. 20, 1967, Ser. No. 624,628
2 Claims. (Cl. 264—25)

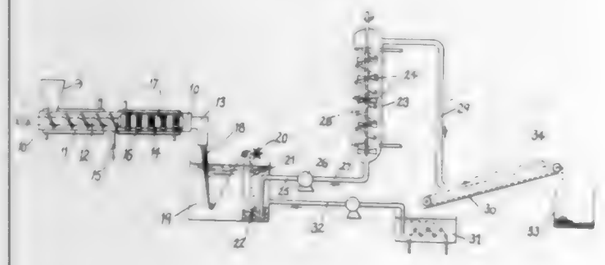
A method of molding and curing a composition of an epoxy resin and a polar epoxy resin curing agent in which the composition is uniformly dielectrically preheated to a temperature within 50° F. of the post-curing temperature within a period of from about 4 to about 60 seconds and poured into a mold which has also been

preheated to the post-curing temperature. The filled mold is maintained at the post-curing temperature for a period of from about 5 to about 45 minutes to gel the composition. The gelled composition is removed from the mold and post cured for a period of from about 30 to about 60 minutes to completely cure the composition. The post-curing temperature can range, for example, from about 150° to about 200° F.

3,372,215
PRODUCTION OF EXPANDABLE POLYMER PARTICLES

Leslie A. Muirhead and Edward L. Hill, Wilmslow, and Brian W. Forster, Lymm, England, assignors to Shell Oil Company, New York, N.Y., a corporation of Delaware

Filed Mar. 16, 1966, Ser. No. 534,829
Claims priority, application Great Britain, Mar. 17, 1965, 11,311/65
8 Claims. (Cl. 264—53)



In the manufacture of expandable thermoplastic particles, such as polystyrene particles containing a vaporizable blowing agent, the vaporizable mass is extruded in filamentary form as an unexpanded extrudate, immediately cooled by contact with a fluid to a temperature not below 60° C., and maintained at that temperature for a normalizing period of time sufficient to result in a product which, upon later unconfined expansion, results in expanded particles in which 90% of the cells have a cell diameter not greater than 100 microns.

3,372,216
METHOD OF MANUFACTURING A MAGNETIC MEMORY CORE

Cornelis Jacobus Esveldt and Thomas Johannes van der Weerden, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

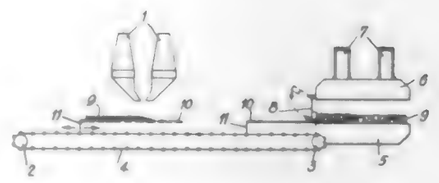
No Drawing. Filed Mar. 24, 1965, Ser. No. 442,536
Claims priority, application Netherlands, Mar. 28, 1964, 64—3,377
1 Claim. (Cl. 264—61)

1. A method of manufacturing an annular magnetic core having an external diameter less than 0.9 mm., an internal diameter of at least half the external diameter, and a height of 0.2 to 0.3 mm., a value of $uV1>18$ mv. and a value of the quotient $uV1/dVz>5$ at a disturbance ratio of 0.55 and a rise time (τ) of 0.2 microsecond comprising the steps of forming a finely-divided mixture of about 39 to 41 mol. percent of Fe_2O_3, about 49 to 51 mol. percent of MnO, about 4 to 6 mol. percent of CuO, and about 4 to 6 mol. percent of ZnO, heating said mixture to a temperature between about 600° C. and 700° C., finely-dividing the resulting product, mixing the finely-divided resulting product with an organic binder, separating a grain fraction from the latter mixture having a grain size between 50 and 120 microns, compacting the latter grain fraction into annular bodies having dimensions approximating those desired in the annular cores, heating the annular bodies to a temperature of about 1350° C. to 1370° C. within sixty seconds in an atmosphere containing at least as much oxygen as air while on a substrate of a refractory metal, cooling the annular bodies to a temperature of about 930° C. to 975° C. at a rate not exceeding 30° C./min., and air quenching the annular bodies.

3,372,217
METHOD AND APPARATUS FOR THE MANUFACTURE OF PRESSED BOARDS

Franciscus Paerels and Werner Ernst Hostettler, Zurich, Switzerland, assignors to Fred Fahrni, Zurich, Switzerland

Filed Oct. 30, 1961, Ser. No. 148,340
Claims priority, application Switzerland, Oct. 28, 1960, 12,099/60
7 Claims. (Cl. 264—122)



2. In a method for the manufacture of pressed boards from wood particles provided with bonding substances, characterized in forming a particle blank below a scattering device by scattering on an endless belt of a transport device, inserting this transport device in the open press, and withdrawing this device from the press while running the belt at the same time, the direction of motion of the belt and its speed being chosen in such a manner that the upper portion of the belt remains motionless in relation to the press plates during this withdrawing motion in order to deposit the blank on the lower press plate without relative motion between the blank and the press plate, and further characterized in that during the scattering operation running the upper portion of the belt alternatively back and forth below the scattering device while the transport device is motionless.

3,372,218
MELT-SPINNING POLYESTER FILAMENTS

David George Bennie, Kinston, and Thurman Ralston Jones, Jr., Greenville, N.C., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Sept. 30, 1964, Ser. No. 400,556
1 Claim. (Cl. 264—169)

1. In a melt-spinning process wherein molten polyethylene terephthalate is spun at a temperature of about 290° C. through a spinneret of chromium steel to form a multifilament yarn, and wherein wetting of the outer face of said spinneret by the molten polyethylene terephthalate has caused spinning discontinuities; the improvement for greatly reducing the frequency of said spinning discontinuities over an extended period of time which comprises conducting said melt-spinning process with a coating on said spinneret face of a continuous film of wax-like tetrafluoroethylene telomer having a number average molecular weight of about 25,000 to 35,000; said coating being produced by heating said spinneret in an electric furnace at a sufficiently high temperature to provide an oxidized surface and cleaning said spinneret, then applying said tetrafluoroethylene telomer as a dispersion, drying the applied dispersion to form a coating, and fusing the coating at a temperature above 325° C.

3,372,219
SYNTHETIC FIBRES BASED UPON POLYVINYL CHLORIDE

Louis Joseph Gord, Ligny-en-Barrois, Meuse, France, assignor to Societe Rhovyl, Paris, France, a French body corporate

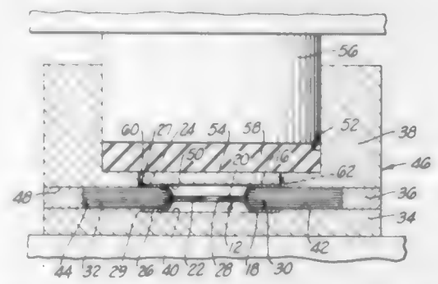
No Drawing. Filed Feb. 6, 1964, Ser. No. 343,148
Claims priority, application France, Feb. 12, 1963, 924,506; Jan. 21, 1964, 961,027
5 Claims. (Cl. 264—210)

Textile fibres based on polyvinyl chloride, but having a particularly low susceptibility to heat shrinkage, are made by spinning from solution or suspension a mixture of chlorinated polyvinyl chloride having a second order transition temperature of at least 100° C., containing at least 66% by weight of chlorine, and having an AFNOR index T51.013 of at least 100, an acetone-soluble content below 10%, and in the form of fibres consisting wholly of the chlorinated polyvinyl chloride, a stretchability in boiling water below 2 times stretch; with polyvinyl chloride, the proportion of the chlorinated polyvinyl chloride being 5–50% of the weight of the mixture.

3,372,220
METHOD OF MOLDING A POLISHING AND DEBURRING WHEEL

Norman H. Stingley, 12801 Woodland Ave., Garden Grove, Calif. 92640

Filed Apr. 12, 1965, Ser. No. 447,166
4 Claims. (Cl. 264—236)



A process for making a polishing and deburring wheel is disclosed in which a wheel having a hub and radially extending wire bristles is located in a mold fitting closely against the hub, a material which is thermohardening and which is elastomeric after thermohardening is injected into the mold adjacent to the hub so as to flow outwardly within the mold substantially parallel to the wires in order to prevent deflection of the wires from a substantially radial position.

3,372,221
PROCESS FOR PREPARING FILAMENTARY MICROTAPES OF LABYRINTHIAN CROSS SECTION

Lloyd E. Lefevre, Bay City, and Robert J. Mathieson, Rhodes, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Continuation-in-part of application Ser. No. 338,279, Jan. 2, 1964. This application Aug. 6, 1965, Ser. No. 477,908
10 Claims. (Cl. 264—285)

This application discloses and claims a process for forming filamentary microtapes comprising the sequential steps of orienting a flat fused ribbon of an organic thermoplastic resinous material passing the so oriented and folded ribbon through restricting means of narrower width than the width of the flat oriented ribbon while maintaining minimum forwarding tension on said ribbon and finally withdrawing the so folded microtape from the restricting means at an angle of at least 15 degrees from the straight line projection of the microtape passage through said restricting means.

3,372,222
PROCESS FOR PREPARING FILAMENTARY MICROTAPES OF LABYRINTHIAN CROSS SECTION

Floyd E. Romesberg and Gerald M. Hart, Midland, and Lloyd E. Lefevre, Bay City, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Continuation-in-part of application Ser. No. 338,278, Jan. 2, 1964. This application Aug. 6, 1965, Ser. No. 477,909
9 Claims. (Cl. 264—285)

This application discloses and claims a process for forming filamentary microtapes comprising the sequential steps of passing a flat fused ribbon of an organic thermoplastic resinous material through restricting means of narrower width than the width of the flat ribbon while maintaining sufficient tension on said ribbon and finally withdrawing the so folded microtape from the restricting means at an angle of at least 15 degrees from the straight line projection of the microtape passage through said restricting means.

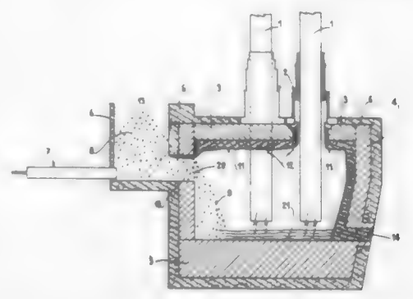
ELECTRICAL

3,372,223
ELECTRIC ARC REDUCTION FURNACE AND METHOD

Charles Daniel Menegoz, Francois Damesin, and Serge Socquet, Mourenx-Ville-Nouvelle, Basses Pyrenees, France, assignors to Pechiney Compagnie de Produits Chimiques et Electrometallurgiques, Paris, France

Filed Jan. 13, 1965, Ser. No. 425,229
Claims priority, application France, Jan. 14, 1964, 960,249
25 Claims. (Cl. 13—9)

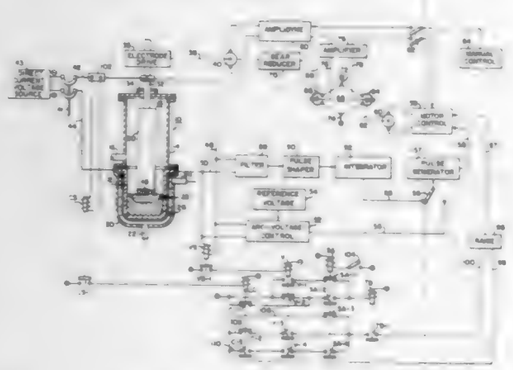
1. An electric arc furnace for reduction of a feed material comprising an oxide ore and a carbonaceous reducing agent, in which substantially all of the electric current supplied to each electrode passes from said electrode into the stripped molten bath on the hearth of the furnace directly through the arc as distinguished from passage through the arc and through the feed material, an electrically insulating device about a portion of each electrode and engaging the electrode in sealing relationship to prevent the escape of vapors therebetween, a lateral prolongation of said device gastightly extending like a dome across the top of the furnace to the furnace side walls, at least one feed opening in a furnace side wall for introduction of the feed material into the furnace, a feed tunnel leading to the feed opening which is located in spaced



relationship from the next electrode and above the hearth of the furnace by amounts to prevent the feed material from coming into contact with the electrode, pistons for displacing feed material laterally into said feed tunnel

and through said feed tunnel into the furnace whereby the feed tunnel is maintained substantially filled with feed material, the reaction vapors arising from within the furnace being limited to passage from the furnace through said feed tunnel whereby substantially all of the condensible part of the vapors condenses upon the feed material for return to the furnace in response to displacement of feed material from the tunnel into the furnace, and at least one top hole in a side wall of the furnace adjacent the hearth for drainage of molten product from the furnace.

3,372,224
CONTROL SYSTEM FOR CONSUMABLE ELECTRODE ARC MELTING FURNACE TO RAISE THE ELECTRODE UPON A POWER FAILURE
Harold S. Jackson, Troy, N.Y., and James B. Murtland, Jr., and Charles F. Rebhun, Natrona Heights, Pa., assignors to Allegheny Ludlum Steel Corporation, Brackenridge, Pa., a corporation of Pennsylvania
Filed Sept. 15, 1964, Ser. No. 396,647
11 Claims. (Cl. 13—13)

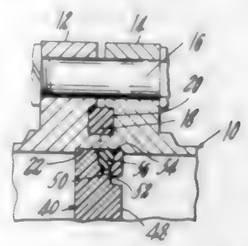


1. In a consumable electrode furnace of the type in which an arc normally exists between a consumable electrode and a molten pool of metal beneath it by virtue of the application of electrical power between the electrode and the pool to create arc voltage and arc current; the improvement of apparatus for moving the electrode upwardly and away from the pool upon failure of said power source, comprising means for sensing arc current, means for sensing arc voltage, and mechanism operable in response to the absence of both arc current and arc voltage for causing the electrode to move upwardly and away from the pool.

3,372,225
ELECTRONIC MUSICAL INSTRUMENT INCORPORATING ROTARY ELECTROSTATIC DEVICES FOR PRODUCING CELESTE OR CHORUS EFFECTS
Donald J. Leslie, Pasadena, Calif., assignor to Columbia Records Distribution Corp.
Filed Mar. 10, 1964, Ser. No. 350,717
53 Claims. (Cl. 84—1.24)

In order to produce a celeste or chorus effect, auxiliary electrical-acoustic channels are derived from the main channels of the electronic organ. One auxiliary channel, including a frequency changing device **15**, suitable amplifiers and a speaker **18**, derives signals from one organ output **11** at which impulses corresponding to notes C, D, E, F#, G# and A# exist. The other auxiliary channel, including the frequency changing device **19**, suitable amplifiers and a speaker **12**, derives signals from the other organ output **12** at which impulses corresponding to notes C#, D#, F, G and B exist. Each frequency changing device (FIG. 3) includes a rotary electrostatic plate **36** cooperable with stationary plates **31**, **32**, **33** and **34** at which the impulses respectively exist in equiangularly spaced phase shift relationship. Motive means M drives the plate **36** at a variable or random rate such as by the device shown in FIGS. 6, 6*a*, 7 and 8.

3,372,226
COAXIAL TRANSMISSION LINE GAS STOP
Donald N. Sewell, Acton, Mass., assignor to Dielectric Products Engineering Company, Inc., Littleton, Mass., a corporation of Michigan
Filed Dec. 14, 1965, Ser. No. 513,765
9 Claims. (Cl. 174—22)



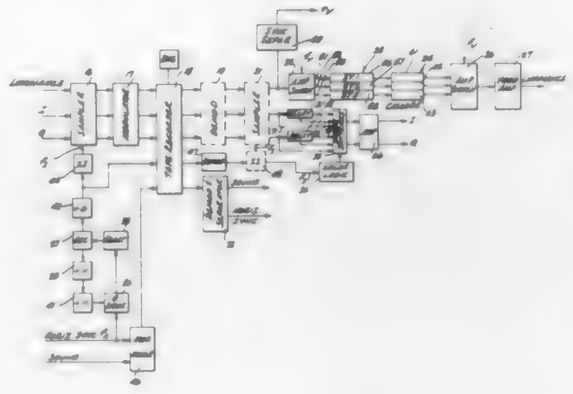
A gas stop structure for replacing an anchor insulator of standard configuration without the necessity of modifying the joint of a coaxial transmission line comprises a Teflon disc having a groove in its inner periphery in which an O-ring member is received for sealing engagement with the inner conductor of the transmission line. A V-shaped groove is formed in the outer periphery of the disc off center of its width and a compensating groove is formed in one face of the disc adjacent the base of the V-shaped groove. This latter groove, in addition to providing electrical compensation, increases the flexibility of one wall of the V-shaped groove. A silicone rubber O-ring having a cross sectional area approximately three times the cross sectional area of the compensation groove, is disposed in the V-shaped groove and forces the flexible wall of that groove out so that the rubber O-ring lies entirely within the V-shaped groove. Thus the rubber O-ring does not interfere with assembly of the disc and inner and outer conductors, while clamping pressure on the walls of the disc at its outer periphery forces the rubber O-ring out into sealing relation with the outer conductor.

3,372,227
ELECTRICAL CONNECTOR UNIT
Kenneth C. Allison, 1546 S. Shore Drive, Crystal Lake, Ill. 60014
Filed Sept. 21, 1966, Ser. No. 581,047
7 Claims. (Cl. 174—87)

Electrical connector unit having an inner sleeve of deformable sheet metal having openings with edge portions which define teeth adapted to pierce the insulation

of wire lead end portions confined within said sleeve. The sleeve has an entrance at one end thereof through which the wire lead end portions have access to the interior area of the sleeve so as to occupy a position opposite said teeth, said interior area of the sleeve being of gradually diminishing cross-sectional size away from said entrance pending such deformation of the sleeve.

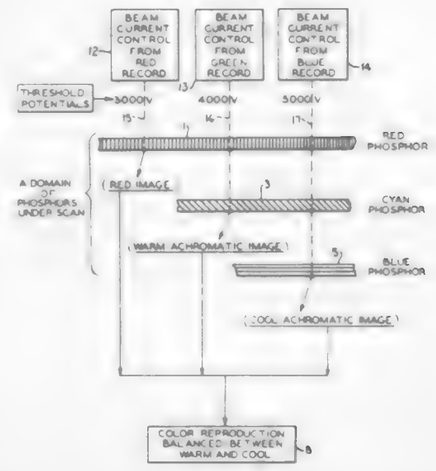
3,372,228
TELEVISION SIGNAL RECORDER
Russell R. Law, Malibu, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed May 21, 1965, Ser. No. 457,642
16 Claims. (Cl. 178—5.4)



A system for reducing the bandwidth requirements of a television signal including a sampler which samples one out of every *n* information areas in a pattern that is repeated every X-frames, a multiple channel recorder for recording the sampled luminance and chrominance information on separate channels; and a circuit for reconstructing the television signal from the played-back sampled information including a plurality of storage tubes alternately operable so that X-frames of played-back luminance information is written into one storage tube while X-frames of previously stored luminance information is read out of another storage tube and a pair of tapped delay lines which delay the played-back sampled chrominance signals for time durations which are multiples of one horizontal scan line whereupon the delayed chrominance signals are combined on the same scan line with non-delayed played-back chrominance information.

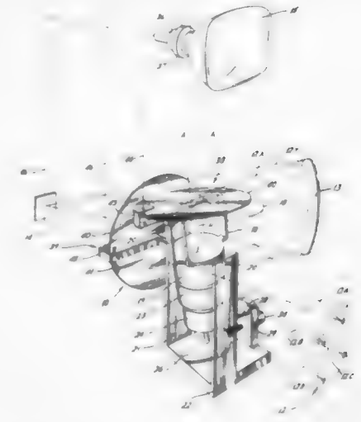
3,372,229
COLOR DISPLAY SYSTEM BY SUPERPOSITION OF A RED IMAGE WITH WARM AND COOL ACHROMATIC IMAGES
Carl A. Barlow, Jr., and Samuel R. Shortes, Dallas, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware
Continuation of application Ser. No. 450,705, Apr. 26, 1965. This application Feb. 6, 1967, Ser. No. 614,362
25 Claims. (Cl. 178—5.4)

Disclosed are color display systems and methods for producing colored images from a plurality of records. The system includes a viewing screen having first, second and third phosphors which when energized emit light of different wavelengths. Switching means are provided for energizing the first phosphor in response to a first record to produce a corresponding image in light of relatively long wavelengths, for independently simultaneously energizing the first and second phosphors in response to a second record to produce a corresponding image in warm substantially achromatic light, and for independently simultaneously energizing all of the phosphors in response to a



third record to produce an image corresponding to the third record in cool substantially achromatic light.

3,372,230
TEMPERATURE SCANNING APPARATUS
Albert Wurz, North Wales, Pa., assignor to Philco-Ford Corporation, a corporation of Delaware
Filed Mar. 31, 1965, Ser. No. 444,367
2 Claims. (Cl. 178—6.8)

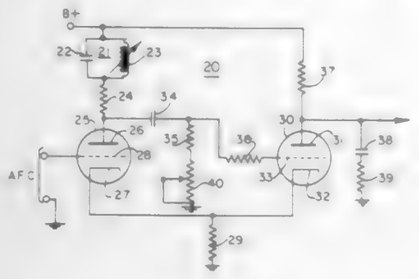


Apparatus for determining and displaying temperature patterns. A reflector is mounted for rocking and rotary motions, and is combined with individually illuminated light shutter members which partake of these motions. Thermal radiations, to be determined and displayed, are transmitted by this reflector to a transducer to control the cathode of a cathode ray tube. Electric signals are derived from the illumination passed by the shutter members to control the deflectors of the cathode ray tube.

3,372,231
SINE WAVE STABILIZED MULTIVIBRATOR
Donald J. Barchok, Chicago, Ill., assignor to Admiral Corporation, Chicago, Ill., a corporation of Delaware
Filed Feb. 15, 1965, Ser. No. 432,495
8 Claims. (Cl. 178—7.3)

1. In a television receiver; a multivibrator oscillator including first and second vacuum tube units having respective anodes, cathodes, and control grids; an impedance

common to said cathodes providing feedback voltages between said vacuum tube units; a coupling circuit joining the anode of said first tube unit to the control grid of said second tube unit; a source of direct current control voltage controlling the frequency of said multivibrator coupled to the control grid of said first tube unit; a sine-

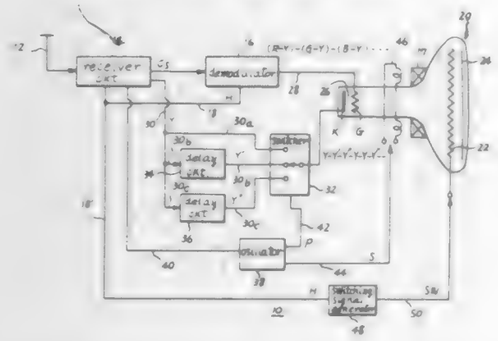


wave stabilizing circuit connected in the anode circuit of said first tube unit; and means in said coupling circuit altering the switching time of said multivibrator whereby a wider range of control voltage may be tolerated without danger of said multivibrator going into uncontrolled oscillation.

3,372,232
COLOR TELEVISION RECEIVER

Satoshi Shimada, Tokyo, Japan, assignor to Sony Corporation, Tokyo Japan, a corporation of Japan

Filed Aug. 30, 1965, Ser. No. 483,619
15 Claims. (Cl. 178—5.4)



A phosphor strip kinescope television receiver having means for applying a luminance signal to the electron gun of the color kinescope and including first and second delaying circuits for delaying the luminance signal for substantially the duration and twice the duration respectively of the horizontal sweep. The luminance signal, the delayed signal, and the subsequently delayed signal are rapidly switched by means of an oscillator circuit to cause each of said three signals to impinge on each vertical phosphor strip. Grid means are provided to assure that only one color is illuminated during each horizontal sweep, and the proper color difference signal is added to the luminance signals during the given color sweep. In this way, all of the picture information is applied to each color phosphor strip through sequential horizontal sweep illumination.

3,372,233
HORIZONTAL AND VERTICAL SYNC SIGNAL COMPARISON SYSTEM

Charles H. Currey, Northbrook, Ill., assignor to A. C. Nielsen Company, Chicago, Ill., a corporation of Delaware

Filed Mar. 29, 1965, Ser. No. 443,257
12 Claims. (Cl. 178—69.5)

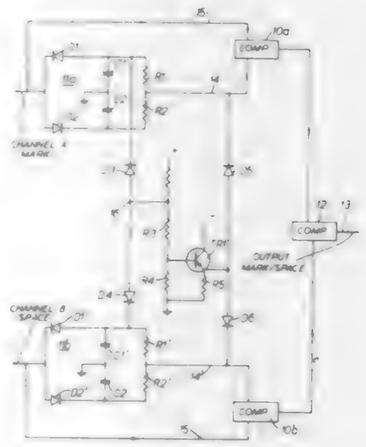
The phase of horizontal and vertical synchronization signals from reference and monitored receivers are compared to determine the channel to which the monitored receiver is tuned. First and second coincidence gates deliver output pulses when the horizontal and vertical synchronization signals are respectively in phase and the output pulses are applied to a third coincidence gate which de-

livers output pulses only when pulses are received from both the first and second gates. A multivibrator and integrator serve to provide a DC signal when output pulses are received from the third gate and the DC signal operates an indicator or recorder.

3,372,234
PULSE SIGNAL DEMODULATOR WITH JUDGEMENT LEVEL PRODUCING AND COMPARISON MEANS

Edward Albert Henry Bowsher, Romford, and Kenneth George Perkins, Cranham, England, assignors to Plessey-UK Limited, a company of Great Britain

Filed Feb. 10, 1964, Ser. No. 343,899
Claims priority, application Great Britain, Feb. 21, 1963, 6,944/63
4 Claims. (Cl. 178—88)

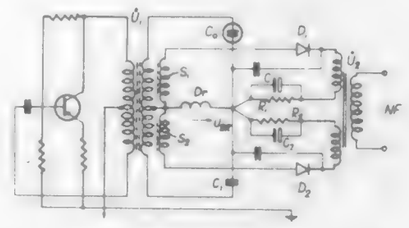


Telegraph receiving apparatus including independent demodulators for "MARK" and "SPACE" channels each demodulator being responsive to a repetitive input signal capable of having either of two levels whose relative and absolute values are liable to variation and including a comparator circuit arranged to receive as separate input signals the instantaneous level of the received signal and a judgement level which lies approximately half way between the level of the maximum and minimum values of the input signal, the comparator circuit being arranged to give an output indicating which of the instantaneous or judgement levels is the greater, the "MARK" and "SPACE" channel demodulators each being associated with a common clamping circuit arranged to prevent the judgement level for either demodulator from rising above a level corresponding to a predetermined fraction of the highest instantaneous signal level obtaining in either channel.

3,372,235
HIGH FREQUENCY CIRCUIT ARRANGEMENT FOR CAPACITIVE TRANSDUCER

Bernhard Weingartner, Vienna, Austria, assignor to Akustische U. Kino-Gerate Gesellschaft m.b.H., Vienna, Austria, a firm

Filed May 18, 1964, Ser. No. 368,104
Claims priority, application Austria, May 20, 1963, A 4,073/63
6 Claims. (Cl. 179—1)

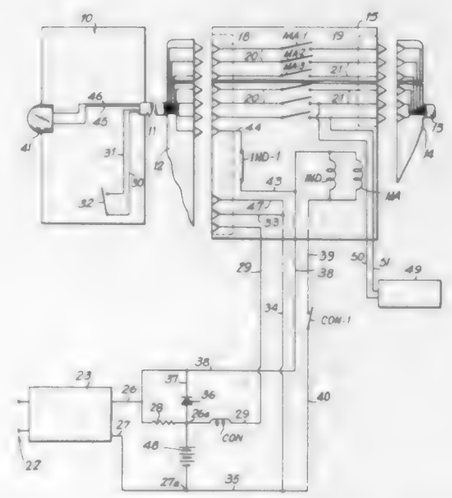


A high frequency electrostatic microphone circuit comprises a transformer having a center tapped secondary winding connected in circuit with a capacitor microphone and a fixed capacitor to form a bridge circuit. The transformer primary winding is connected to the output of a high frequency oscillator. An inductor is connected between the secondary center tap and the junction of the microphone and capacitor. The circuit also includes a demodulating network comprising a pair of oppositely poled diodes, an output transformer having a primary winding in two sections, and the parallel combination of a resistor and capacitor. These elements are connected together to form two series circuits, each including the inductor, across the center tapped secondary winding. The capacitor is chosen so that the parallel R-C circuit exhibits a low impedance to audio frequency signals.

3,372,236
ISOLATING SWITCH ARRANGEMENT FOR TELEPHONES

Edmund I. Schwartz, Fairlawn, N.J., assignor to Devenco Incorporated, New York, N.Y., a corporation of New York

Filed Jan. 18, 1965, Ser. No. 426,261
8 Claims. (Cl. 179—1)



Relay has switches interposed between mainline cable and telephone instrument. Relay coil is energized to close switches when handset is lifted, and deenergized when handset is replaced. Relay embedded in mass of hardened plastic. Indicator lamp energized through switch of second relay when switches of first relay are open, and deenergized when first relay switches close.

3,372,237
MULTIPLEX COMMUNICATION SYSTEM WHEREIN A REDUNDANT BIT OF ONE SIGNAL IS REPLACED BY A BIT OF ANOTHER SIGNAL

Kenneth R. Hackett, Boulder, Colo., assignor to Ball Brothers Research Corporation, Boulder, Colo., a corporation of Colorado

Filed Sept. 18, 1963, Ser. No. 309,788
10 Claims. (Cl. 179—15)

10. Apparatus for multiplexing and demultiplexing a first digital signal and a second digital signal, comprising means to create spaces periodically at spaced time intervals on said first signal, said spaces being separated by a plurality of pulses of said first signal, means to insert pulses from said second signal successively into said spaces, at least a portion of which pulses constitute a synchronizing pattern, to form a multiplexed digital signal containing both said first and second digital signals, retiming means to alter said multiplexed digital signal into a series of pulses of substantially equal perods for subsequent transmission or manipulation, means to individually sample and examine selected pulses from said multiplexed digital signal to determine whether they constitute part of said synchronizing pattern including means to generate control pulses to advance the sampling process to a succeeding pulse until said synchronizing pattern is located, means to gate the pulses comprising said second signal from said multiplexed signal to obtain said second digital signal, means to retime the pulses on said multiplexed signal so that the pulses comprising said second signal occupy a substantially smaller time interval than the other pulses, and means to sample said retimed multiplexed signal so as to sample only the pulses comprising said first signal to obtain said first digital signal.

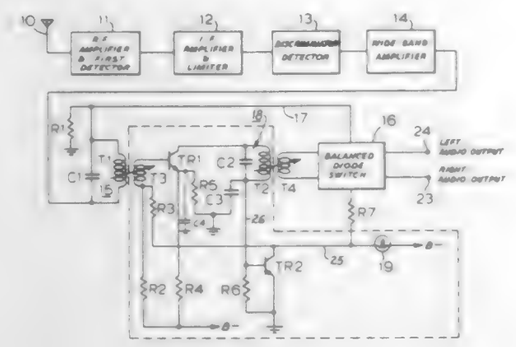
3,372,238
STEREOPHONIC DECODERS FOR F.M. RECEIVERS

Roland H. Fichtner, Waterloo, Ontario, Canada, assignor to Dominion Electrohome Industries Limited, Kitchener, Ontario, Canada

Filed Oct. 10, 1966, Ser. No. 585,660
6 Claims. (Cl. 179—15)

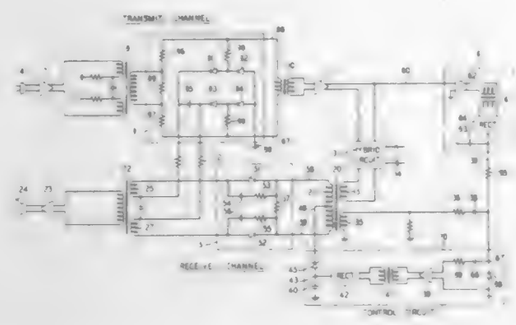
"Motorboating" of an F.M. receiver adapted to reproduce both monaural and stereophonic signals is avoided

by means of a single transistor connected to the tuned circuit of the frequency doubler of the stereophonic decoder and a D.C. feedback path between this transistor and the doubler transistor that varies the base-emitter D.C. bias of the doubler transistor and increases its collec-



tor current in response to an increase in the collector current of the former transistor, whereby a stronger signal is required to switch the decoder from the monaural to the stereophonic operating condition than the signal required to switch the decoder from the stereophonic to the monaural operating condition.

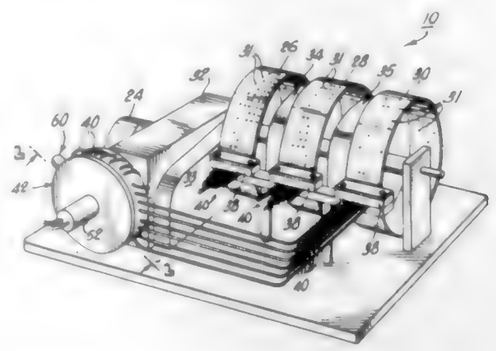
3,372,239
VOICE-SWITCHED INTERPHONE SYSTEM
Frank J. Clement, Matawan, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed July 1, 1964, Ser. No. 379,454
12 Claims. (Cl. 179—81)



In a loudspeaker telephone system, variolossers insert complementary losses into the transmit and receive channels respectively to reduce acoustical and transhybrid feedback. A direct current flowing through parallel branches of a control circuit regulates the loss inserted by each variolosser, the control circuit being constructed in such a way that clipping and variolosser unbalance are minimized.

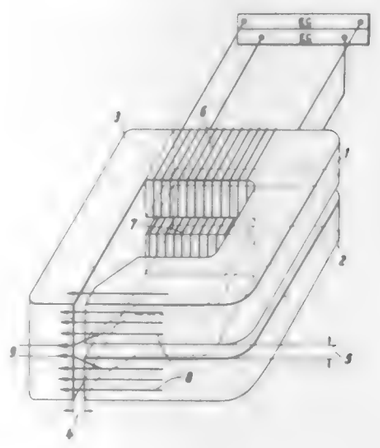
3,372,240
TIME INDICATING RECORDING AND REPRODUCING APPARATUS
John S. Boyers, Bridgeport, Roger C. Curtis, New Haven, Ralph H. Sherman, Jr., Bridgeport, and Raymond R. Crowley, Fairfield, Conn., assignors to Dictaphone Corporation, Bridgeport, Conn., a corporation of New York
Filed Oct. 14, 1963, Ser. No. 315,839
8 Claims. (Cl. 179—100.2)

A recording and reproducing system particularly useful in monitoring audio communications such as communications between aircraft and an aircraft control tower at an airport. The audio communication is recorded on a magnetic record such as a belt or tape, and coded digital signals are recorded at regular intervals on the record near the recorded audio communications. Each of the coded digital signals represents the time of day when the adjacent communication was recorded. The reproducing portion of the system audibly reproduces the audio communications while simultaneously converting the coded digital time of day signals into decimal form



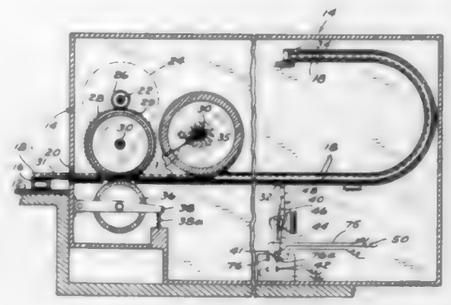
and displaying them visually. Thus, a particular recorded portion can be located rapidly because the time of day when it was recorded is displayed visually while the recording is being reproduced. The system for producing coded digital time-of-day signals includes synchronously-driven rotary drums with coded patterns of holes in them. Light from lamps shines through the holes and into a photoelectric light-to-electric signal transducer structure which produces the desired signals.

3,372,241
MULTITRACK ERASE HEAD
Werner Dziekan and Harald Harkensee, Wedel, Holstein, Germany, assignors to Telefunken Patentverwertungs-G.m.b.H., Ulm (Danube), Germany
Filed Oct. 22, 1963, Ser. No. 318,027
Claims priority, application Germany, Oct. 22, 1962, T 22,897; May 18, 1963, T 24,017
6 Claims. (Cl. 179—100.2)



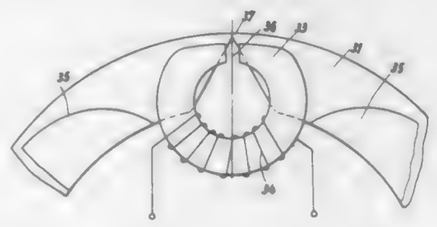
A magnetic erasing head for multiple track tape recorders in which a plurality of spaced core halves are attached at one end to a common core plate which is as wide as the magnetic tape for the recorder, each of the spaced core halves being as wide as a single track of the magnetic tape and being separated from the common core plate by an air gap, with an individual winding for each of the spaced core halves and circuit means for energizing all of the windings simultaneously to erase the entire magnetic tape or fore individually energizing selected windings to erase the corresponding individual track.

3,372,242
MAGNETIC TAPE DEVICE WITH FLEXIBLE HEAD MOUNTING AND MOVING MEANS
Elmer E. Garrett, Rte. 133, Bridgewater, Conn. 06752
Filed Dec. 10, 1963, Ser. No. 329,538
6 Claims. (Cl. 179—100.2)



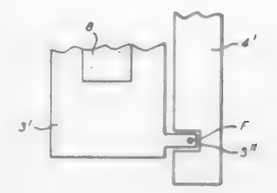
A magnetic tape device having a magnetic recording and reproducing head carried by a flexible tongue. The tongue is slidable in a guide which has straight and arcuate sections, the latter being housed. A motor driven feed means causes the tongue to move in and out of the arcuate guide while a spring pressed take up device winds and unwinds the electrical connectors for the head. Circuitry is provided for selectively stopping the tongue after a single cycle or alternatively to cause it to cycle continuously.

3,372,243
VIDEO TRANSDUCER INCLUDING HIGH AND LOW FREQUENCY SYSTEMS
Eduard Schüller, Wedel, Holstein, Germany, assignor to Telefunken Patentverwertungs-G.m.b.H., Ulm (Danube), Germany
Original application Sept. 10, 1962, Ser. No. 224,464, now Patent No. 3,255,307, dated June 7, 1966. Divided and this application Jan. 14, 1964, Ser. No. 351,880
Claims priority, application Germany, Sept. 8, 1961, T 20,724
8 Claims. (Cl. 179—100.2)



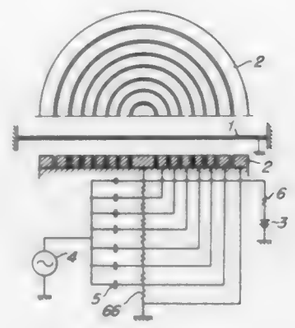
A rotatable magnetic head arrangement for the scanning of broad band signals in the form of a succession of magnetic traces carrying magnetic fields having but a single direction of magnetization and varying according to the entire frequency range of the board band signal, the head arrangement including two annular magnetic systems each having an air gap, the two system air gaps extending parallel to one another and being at least partially coextensive, one magnetic system being responsive to the high frequency portion of the signal band and the other magnetic system being responsive to the low frequency portion thereof.

3,372,244
SEMICONDUCTIVE TRANSDUCERS
Mathew E. Sikorski, New Providence, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Original application May 23, 1963, Ser. No. 282,792. Divided and this application July 7, 1966, Ser. No. 574,521
1 Claim. (Cl. 179—110)



The disclosure is directed to electromechanical transducers in which stress is applied in various ways to one or both junctions of a transistor. Several device configurations are disclosed which are designed to increase the efficiency of translation of the stress to the junction.

3,372,245
ELECTROSTATIC ELECTRO-ACOUSTIC TRANSDUCER
Tomio Yoshida, Yokohama, and Yasuhiro Riko, Kawasaki-shi, Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan, a corporation of Japan
Filed Jan. 20, 1964, Ser. No. 338,679
Claims priority, application Japan, Jan. 25, 1963, 38/2,687; Oct. 5, 1963, 38/75,582, 38/75,583
9 Claims. (Cl. 179—111)

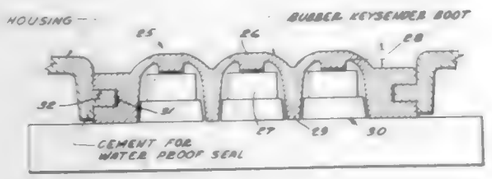


An electrostatic electroacoustic transducer including a novel driving electrode which drives the vibrating member in the manner that the force across the vibrating member is proportional to the free vibrational mode in order for that number to vibrate at a single mode over whole frequency range, the frequency characteristics being further improved by using a novel structure of driving electrode having an auxiliary electrode for motional feedback.

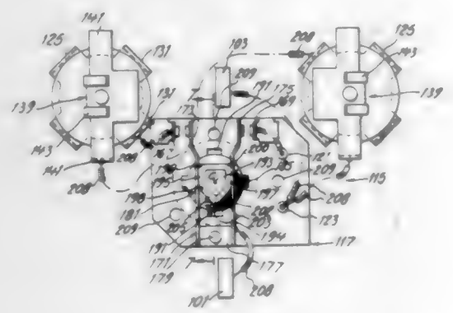
3,372,246
WATERPROOF PUSHBUTTON TELEPHONE SUBSET
Walter J. Knuepfer, La Grange, Ill., assignor to International Telephone and Telegraph Corporation, New York, N.Y., a corporation of Delaware
Filed Aug. 14, 1964, Ser. No. 389,676
1 Claim. (Cl. 179—179)

A waterproof telephone subset is provided. The set has

pushbuttons for dialing which are covered by a resilient boot. The boot permits operation of each button individually while preventing the ingress of water or dust into the set.

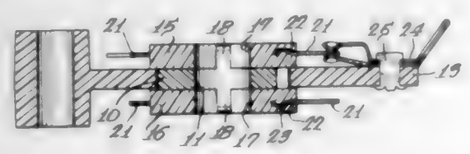


3,372,247
ELECTRIC SWITCH HAVING A PAIR OF CONTACTS ACTUATED BY A CAM MEANS HAVING A PLURALITY OF FLAT OUTER SURFACES
David R. Locke, Bridgeport, and Ronald B. Wuennemann and Robert J. Tolmie, Fairfield, Conn., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Original application Jan. 12, 1962, Ser. No. 165,819, now Patent No. 3,255,435, dated June 7, 1966. Divided and this application Oct. 21, 1965, Ser. No. 513,887
2 Claims. (Cl. 200—6)



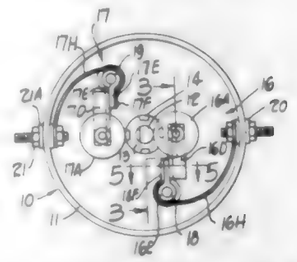
This disclosure is directed to an electric switch comprising a pair of spaced movable leaf spring contacts each adapted for engagement with a corresponding spaced stationary contact wherein an actuator member is provided with cam means disposed between said movable contacts for controlling movement thereof and having a plurality of spaced flat outer surfaces adapted to coact with said movable contacts to be detented by the latter in any moved position.

3,372,248
MULTIPOSITION ROTARY ELECTRIC SWITCH
Kenneth C. Allison, 1546 S. Shore Drive, Crystal Lake, Ill. 60014
Filed Dec. 27, 1966, Ser. No. 604,760
12 Claims. (Cl. 200—11)



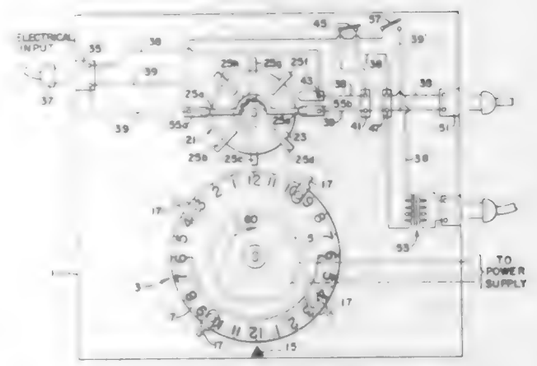
Three section rotor assembly having a pair of rotor contact supporting members containing embedded contacts and a hub member sandwiched between said rotor supporting members and joined in fixed relation to said rotor supporting members by means of axial extensions formed integrally with said hub member.

3,372,249
CIRCUIT BREAKER FOR IGNITION SYSTEMS
Donald D. Withem, 7251 Pettibone Road, Chagrin Falls, Ohio 44022
Filed May 12, 1966, Ser. No. 549,565
9 Claims. (Cl. 200—19)



A circuit breaker arrangement for an ignition system in which there are two cylindrical surfaces non-rotatably mounted on an engine-driven rotatable shaft of an internal combustion engine, the surfaces being spatially disposed relative to each other along the axis of the shaft, a first of the surfaces being of electrical conducting material around its circumference and a second of said surfaces being of electrical conducting material interrupted by electrical insulating material about its circumference, the electrical conducting material of the two cylindrical surfaces being in continuous electrical connection through the shaft, a pair of rollers of electrically conducting material, a first of the rollers being maintained in continuous engagement with the first of said surfaces during its rotation with the shaft, a second of said rollers being in continuous engagement with the second of said surfaces during its rotation with the shaft, one of said rollers being electrically connected with one side of the ignition system and the other of said rollers being electrically connected with the other side of the ignition system, the second roller on engaging the insulating material of the second surface breaking the circuit of the ignition system, the said surfaces and rollers all being enclosed in a unitary housing which carries the rollers in position and which protects the rollers and surfaces from foreign material which might interfere with good electrical contact between rollers and the respective surfaces.

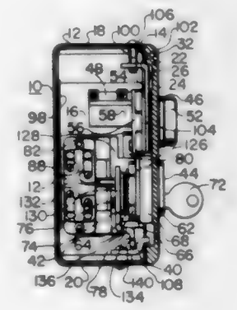
3,372,250
ALL-PURPOSE TIMER
Norman L. Douglas, 119 E. Fudge St., Covington, Va. 24426
Filed Apr. 20, 1966, Ser. No. 543,925
10 Claims. (Cl. 200—38)



1. An all purpose timer for selectively actuating electrically operated devices independent of the electrical requirements for such devices, comprising in combination:
(a) electrical input means;
(b) electrical output means for supplying an output required for the actuation of the electrically operated devices connected thereto;

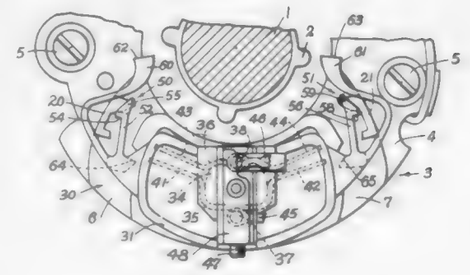
(c) conductive path establishing means electrically connected to said input means and said output means and including first and second contact members, said first contact member being electrically connected to said input means and said second contact member being electrically connected to said output means, and rotatable wafer switch means arranged for selectively connecting said first and second contact members to establish a closed conductive path between said input means and said output means, said switch means including a rotatable switch plate carrying a plurality of conductive bars, each of said bars extending radially from said plate and having another of said bars arranged diametrically opposite thereto, alternate ones of said contact bars being electrically connected with said diametrically opposed bar, said diametrically opposed bar being arranged for contacting said first and second contact members whereby two diametrically opposed and electrically connected bars form a closed conductive path between said first and second contact members so as to establish a conductive path between said input means and said output means;
(d) detent means operatively associated with said switch plate for fixing positions thereof wherein diametrically opposed bars are in alignment with said first and second contact members; and
(e) clock means arranged for cooperation with said wafer switch means for rotating the same at desired intervals so as to selectively cause said electrically connected diametrically opposed conductive bars and said diametrically opposed conductive bars which are not electrically connected to contact said first and second contact members, said clock means including a rotating plate having projecting finger means corresponding to the desired time switching for the electrical devices connected to the output means of the timer, said finger means upon rotation of said clock plate engaging one of said conductive bars of said switch means for pressing against such bar to cause rotation of said switch plate, said detent means fixing a different position of said switch plate and two different diametrically opposed conductive bars contact said first and second contact members.

3,372,251
TAMPER-PROOF KEY-OPERATED ELECTRIC CONTROL STATION
Robert J. Bowman and David F. Wesolowski, Milwaukee, Wis., assignors to Square D Company, Park Ridge, Ill., a corporation of Michigan
Filed Feb. 23, 1967, Ser. No. 617,907
6 Claims. (Cl. 200—44)



A key-operated tamper-proof electric control station having a die cast outlet box and cover with externally accessible screws securing the cover to the box. An internal locking arrangement provided for the control station includes a pin extending from one internal end wall of the box and a strike plate extending from the other internal wall of the box prevents unauthorized access to switches carried by the cover when the securing screws are removed unless a key-operated lock, which actuates the switches and carries a member which hooks behind a portion of the strike plate, is rotated to an unlocked position.

3,372,252
DIRECTION SIGNALING APPARATUS
Walter T. Stol, Warren, and Robert Thomson, Dearborn Heights, Mich., assignors to Boyne Products, Inc., Boyne City, Mich., a corporation of Michigan
Filed Oct. 7, 1966, Ser. No. 585,037
11 Claims. (Cl. 200—61.34)

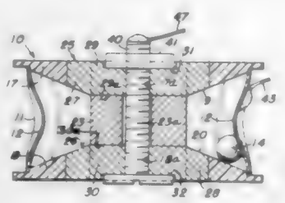


Vehicle direction signaling apparatus having a support on which an actuator is mounted for rocking movement about an axis in either of two directions from a neutral position to a latched, turn indicating position in which a set of indicator lamps at one side or the other of a vehicle is actuated, the support and actuator having cooperable latch parts on the same side of the axis for latching the actuator in its turn indicating position and the support having an abutment engageable by the actuator latch on the opposite side of the axis, the arrangement being such that when the actuator is rocked about the axis in such direction as to effect latching engagement of one actuator latch part and the corresponding support latch, the other actuator latch engages the abutment on the support to arrest the actuator in an intermediate position in which the direction signal indicators at one side or the other of the vehicle are operative and from which position the actuator automatically is restored to its neutral position.

3,372,253
ANTI-DISTURBANCE SWITCH
James L. Baker, Bethesda, and Laurence M. Andrews, Silver Spring, Md., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed May 19, 1958, Ser. No. 736,409
2 Claims. (Cl. 200—61.45)

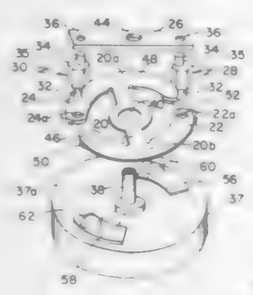
1. An anti-disturbance switch comprising: a hollow metallic cylindrical shell having a series of equi-spaced, inwardly projecting convex wall segments spaced around the shell circumference, said convex segments and said shell forming a series of cavities between successive convex wall segments, upper and lower tapered disks providing closures for the ends of said shell, said disks composed of an insulating material with surfaces tapering towards the shell center, a spur gear in said disk with tooth surfaces ground planar with the tapered surfaces of said disks, the outermost extremity of each tooth extending adjacent and opposite the innermost surface of a corresponding wall segment, said gear and shell acting as electrical conductors separated by the insulation of said disks, a metallic sphere in said shell, the

tapered disks and convex wall segments causing said sphere to rest in a cavity when the switch is at rest, the diameter of said sphere being small enough so that the sphere makes no electrical contact between said convex wall segments and the teeth of said gear, said sphere



being large enough so that when the sphere moves out of said cavity in response to disturbance of the switch it contacts the innermost surfaces of said convex wall segments and the outermost extremities of the gear teeth thus closing the circuit between the shell and gear.

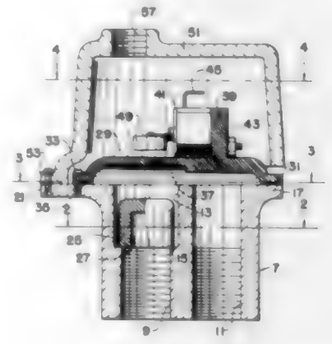
3,372,254
SNAP-ACTING SWITCH MEANS
Hadley Keys Burch, Pittsfield, Vt. 05762, and Lyndon Walkup Burch, 3 River St. Place, Boston, Mass. 02108
Filed Sept. 22, 1966, Ser. No. 583,492
21 Claims. (Cl. 200—63)



1. A snap-acting blade formed of thin resilient material and comprising a central leg, two tension legs each having means thereon forming a mounting point for a stress producing element, and two amplifier legs, one of said tension legs connected to one side, near one end of the central leg, the other tension leg connected to the other side and near the other end of the central leg, the mounting points of said tension legs so located with respect to said blade as to permit the application of tensional stress to said blade to cause it to warp, each amplifier leg connected to the blade in a location to permit amplification of the warpage of said blade, and so connected that when one amplifier leg is warped to one side of the blade, the other leg is warped to the other side, and vice versa, said tension legs and said amplifier legs substantially disposed within a circle centered on the middle of said central leg, projected through the ends of said central leg.

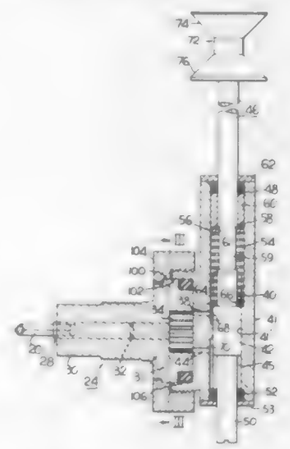
3,372,255
MAGNETICALLY RESPONSIVE FLUID FLOW SWITCH
Melvin O. Allen, 407 S. Coronado, and Shelley Graybill, 606 Cosmos Ave., both of Elkhart, Kans. 67950
Filed Aug. 9, 1965, Ser. No. 478,336
2 Claims. (Cl. 200—81.9)

1. A fluid flow switch comprising, a housing of non-magnetic material having an inlet bore and an outlet bore through same, the axes of said bores generally parallel to each other, each of said bores having internal threads in one end portion thereof, said inlet bore having a cylindrical float chamber in the other end portion thereof, said chamber having a diameter greater than the diameter of said bores and forming a float shoulder in said inlet bore, a generally circular flange portion of said housing on the other end portion thereof having a flat outer surface perpendicular to the axes of said bores, a plurality of threaded spaced cap mounting holes around the outside portion of said flange and through same, three integral cover mounting tabs around the outside portion of said flange having threaded cover mounting holes therein, a cylindrical float of magnetic responsive material having a diameter smaller than the diameter of said float chamber but greater than the diameter of said inlet bore and having a length less than the length of said float chamber, said float movably mounted in said float chamber with one end portion thereof engageable with said float shoulder, a blind bore in the said end portion of said float engageable with said shoulder, a circular domed cap of non-magnetic material sealingly mounted on said flange portion of said housing, an annular mounting flange portion of said cap having spaced mounting holes therethrough coincidental with said cap mounting holes of said housing, screw means mounting said cap on said housing, a sealing material between said cap and said housing sealing same, said dome portion of said cap forming a fluid chamber between said housing and said



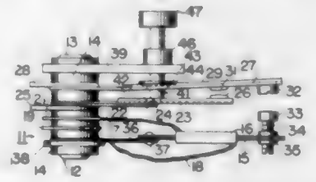
cap, a switch mounting bracket on the top outside portion of said cap, an electrical switch means mounted on said bracket, a switch actuating lever mounted on and extending from said switch means, a permanent magnet mounted on the projecting end portion of said lever and immediately above said float chamber, said magnet tending to be held away from said cap by said switch means, a non-magnetic cup-shaped cover having three mounting flanges around the bottom open end portion thereof coincidental with said cover mounting tabs of said housing, said cover mounted on said housing by screw means through said mounting holes, electrical wiring means operably mounted on said switch means and through said cover, said flow switch constructed and adapted to pass fluid into the threaded end portion of said inlet bore, through said float chamber and around said float and into said fluid chamber, out of said chamber and into and out through said outlet bore, the velocity of said fluid flow forcing said float upwards in said float chamber and engaging a bottom portion of said cap immediately below said magnet, said magnet drawn downwardly towards said float engaging the outside top portion of said cap, and moving said lever to actuate said switch until said fluid flow is insufficient to maintain said float in engagement with said cap, and said float falls downwardly away from said cap, whereupon said magnet lifting from said cap by said switch means and said lever activating said switch.

3,372,256
ROTARY MOTION DETECTOR WITH SIGNAL DEVICE
Neil J. Ryskamp, Markham, Ill., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Filed July 27, 1966, Ser. No. 568,158
1 Claim. (Cl. 200—82)



A rotary motion detector for sensing movement of a moveable part utilizing in combination a hydraulic actuator and positive displacement pump.

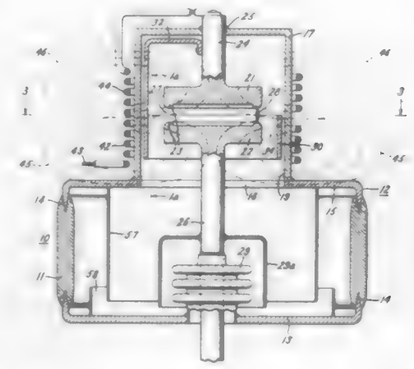
3,372,257
CIRCUIT OPENING RESET MEANS FOR NORMALLY CLOSED ELECTRIC SWITCHES
Edward S. Arlin, Norwalk, and Wayne T. Watson, Mansfield, Ohio, assignors to Norwalk Thermostat Company, Norwalk, Ohio, a corporation of Ohio
Filed Apr. 4, 1966, Ser. No. 539,764
10 Claims. (Cl. 200—122)



A resettable switch having two mutually engageable contacts, each separately mounted for displacement and a reset element having abutments which engage each contact mount to establish a separation of the contacts as a function of the separation of the abutments during a reset operation. The displacement of the reset element to the reset position displaces the contact mount, which makes the principal transit when the switch is tripped to its latch position while displacing the mount of the cooperating contact from its reset position to insure that separation of the contacts is maintained. When the resetting force is removed from the reset element, that element is retracted so that its abutment for the contact mount making the principal transit is spaced from the mount.

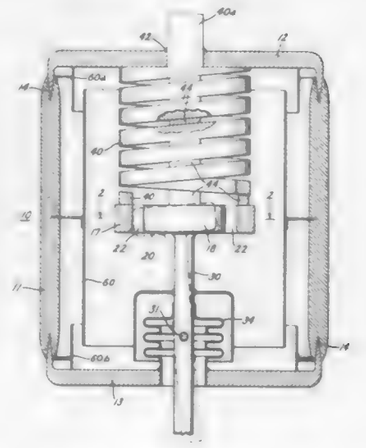
3,372,258
ELECTRIC CIRCUIT INTERRUPTER OF THE VACUUM TYPE WITH ARC-VOLTAGE CONTROL MEANS FOR PROMOTING ARC TRANSFER
Joseph W. Porter, Media, Pa., assignor to General Electric Company, a corporation of New York
Filed May 28, 1965, Ser. No. 459,656
11 Claims. (Cl. 200—144)

A vacuum type circuit interrupter in which arc transfer to a preferred arcing region of the interrupter is promoted by forcing high current arcs located outside the preferred arcing region tob urn with a higher arc voltage than when in said preferred arcing region. The lower arc



voltage in the preferred arcing region is obtained by a strong magnetic field that is oriented generally parallel to the arc when in the preferred arcing region but transverse to arc when outside the preferred arcing region.

3,372,259
VACUUM-TYPE ELECTRIC CIRCUIT INTERRUPTER WITH ARC-VOLTAGE LIMITING MEANS
Joseph W. Porter, Media, Pa., assignor to General Electric Company, a corporation of New York
Filed May 28, 1965, Ser. No. 459,657
9 Claims. (Cl. 200—144)

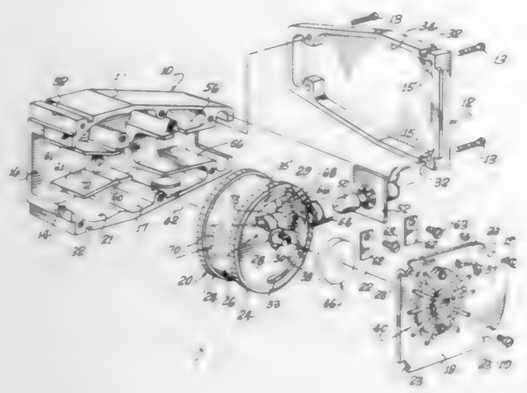


A high-current, A-C circuit interrupter of the vacuum type, comprises a first electrode and a second electrode of generally annular form surounding the first electrode in radially-spaced relationship to define an annular vacuum gap therebetween. During interruption, an arc extending radially of the annular gap is developed and driven circumferentially of the gap. The arc voltage developed by the circumferentially-moving arc is limited by a magnetic field that has its lines of force extending across the annular gap about its entire circumference in a radial direction.

3,372,260
POSITION INDICATOR FOR ROTARY ELEMENT
John M. Bell, Altadena, Calif., assignor to Victoreen Instrument Company, Cleveland, Ohio, a corporation of Ohio
Filed Oct. 19, 1965, Ser. No. 497,992
8 Claims. (Cl. 200—167)

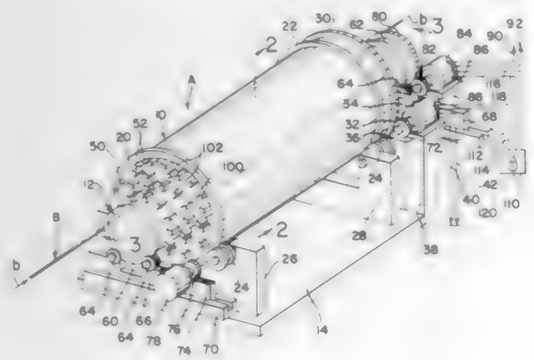
The rotary position of an element, typically a thumbwheel switch, is indicated visually by mounting symbols

at corresponding positions on a cylindrical shell that rotates wth the element; illuminating the symbol at a fixed postion; and projecting a optical image of the illuminated symbol onto a diametrically opposite translucent screen.



The optical projecting system is typically contained within the shell, but can greatly magnify the symbol, providing clearly readable indication even of closely spaced angular positions.

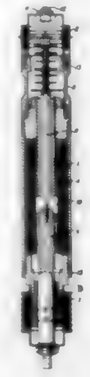
3,372,261
APPARATUS FOR HEATING AN ELONGATED METAL WORKPIECE
Cecil P. Porterfield, Cleveland, Ohio, assignor to The Ohio Crankshaft Company, Cleveland, Ohio, a corporation of Ohio
Filed June 17, 1965, Ser. No. 464,753
6 Claims. (Cl. 219—10.61)



There is provided an apparatus for heating a wire as it moves along a longitudinal path. This apparatus includes two generally telescoped, rotatable drums with a plurality of mutually facing permanent magnets. The drums are rotated to bring together opposite polarity magnets on opposite sides of the path of the moving wire. These opposite polarity magnets are moved across the path to create heating currents in the wire, without actually coming in contact with the wire.

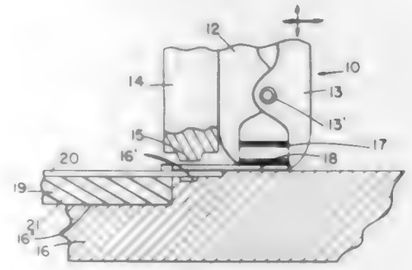
3,372,262
HYDROSOLENOID UNIT FOR ELECTRO-EROSION MACHINES
Abram Lazarevich Livshits, 5th V. Mikhailousky, 28, Apt. 9, and Vadim Evgenjevich Polotsky, Leninsky Prospect, 70/11, Apt. 238, both of Moscow, U.S.S.R.
Filed Apr. 24, 1964, Ser. No. 364,058
4 Claims. (Cl. 219—69)

A hydrosolenoid unit having a cylindrical housing containing a solenoid with a movable core having a vibration damping device including a rod connected to the core and supporting a plurality of removable discs of varied diameter for regulating vibration damping, the housing



having upper and lower bellows secured on both end faces thereof, the lower bellows being rigidly connected at its lower end to the movable core.

3,372,263
WELDING APPARATUS
Jerome H. Lemelson, 85 Rector St., Metuchen, N.J. 08840
Continuation-in-part of application Ser. No. 362,869, Apr. 27, 1964. This application Feb. 7, 1966, Ser. No. 525,504
9 Claims. (Cl. 219—80)

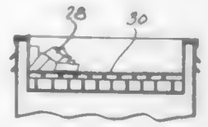


Welding apparatus is provided which is operative to engage, transfer or manipulate and position a member or assembly with respect to another member or assembly to be welded thereto. In one form of the apparatus, mechanical clamping means are provided for seizing and releasing articles to be welded. In another form, air suction means is used to seize, transfer and position articles to be welded whereafter the suction is released to cause release of the article after it is welded. The apparatus is controlled in its operation by automatic control means which may be operative to control the acts of seizing, moving and prepositioning one article to engage another article, the welding of said articles and the release of the assembly in a predetermined cycle of operation of said apparatus.

3,372,264
STOVE FOR SAUNA BATHS
Charles K. Williams, 475 Cambridge St., Ottawa 4, Ontario, Canada
Filed Jan. 27, 1967, Ser. No. 612,130
Claims priority, application Canada, Nov. 22, 1966, 976,104, Patent 764,585
2 Claims. (Cl. 219—367)

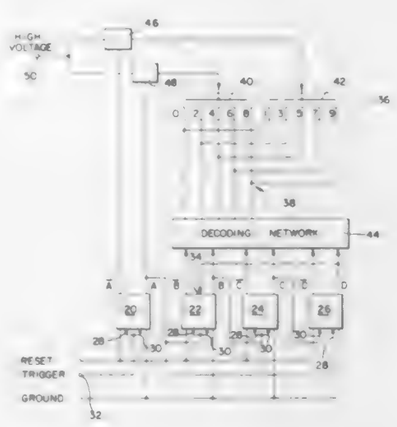
A sauna stove including an open-topped casing having in its upper portion an open-topped cage. The cage bottom comprises an open grid for supporting stones which are heated by electric heating elements mounted either immediately below the grid or positioned on the upper surface of the grid. In the latter arrangement, an expanded

sheet metal heat distributor coextensive in area with the grid may be superposed on the heating elements. Alternatively, a plurality of strips projecting above the heating



elements may be provided on the grid to prevent direct contact of the stove with the heating elements. The casing is provided with ventilating openings.

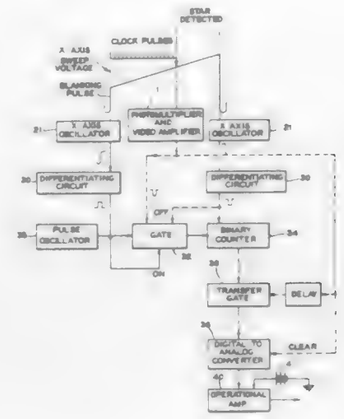
3,372,265
DIGITAL COUNTER
Bernard M. Gordon, Magnolia, and Zaki Abdun-Nabi, Framingham, Mass., assignors, by mesne assignments, to Transitron Electronic Corporation, a corporation of Delaware
Filed July 7, 1964, Ser. No. 380,891
12 Claims. (Cl. 235—92)



A decimal counter includes a biquinary indicator tube having a pair of anodes and ten cathodes associated with a four-stage binary counter and a decoding network so that the indicated count is stepped in sequence in response to each input pulse. There is a feed forward line from the first stage to the fourth stage and a feedback line from the fourth stage to the second stage for restoring the count in the counter to zero upon receipt of every tenth input pulse. The pair of outputs from the first stage are coupled to respective ones of the biquinary tube anodes by means including a gas discharge tube.

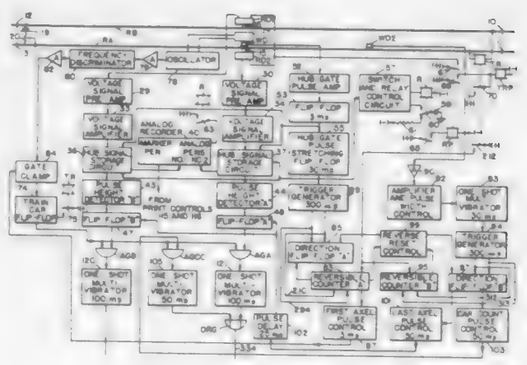
3,372,266
STAR POSITION DETERMINATION CIRCUIT
Edward A. Chilton, Westwood, and George V. Zito, Northvale, N.J., assignors to The Bendix Corporation, Teterboro, N.J., a corporation of Delaware
Filed July 29, 1964, Ser. No. 385,902
8 Claims. (Cl. 235—92)

A circuit for sensing the position of a star has an image dissector tube with a photocathode and provides a signal corresponding to the position of a photoimage of the star thereon. A counter is controlled by scanning means associated with the image dissector to start a count at the beginning of a line scan and to clear the count at the end of a line scan. The signal from the image dissector stops the count of the counter to provide a count corresponding to the photoimage position. Memory means is connected by gating means to the counter, and provides an output corresponding to the photoimage position. The



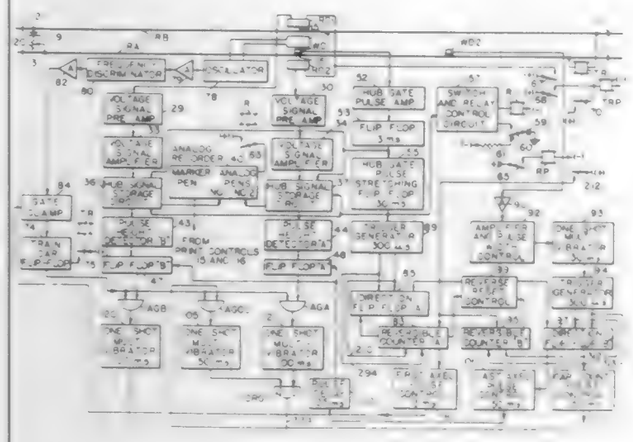
output of the memory means changes only upon a measured change in the photoimage position.

3,372,267
JOURNAL TEMPERATURE INFORMATION RECORDING SYSTEM FOR TRAINS
Donald W. Bramer, Fairport, Lyle Brockman, Rochester, Henry C. Sibley, Adams Basin, and John A. Snell, Rochester, N.Y., assignors to General Signal Corporation, a corporation of New York
Original application May 16, 1961, Ser. No. 110,528, now Patent No. 3,177,359, dated Apr. 6, 1965. Divided and this application Jan. 5, 1965, Ser. No. 423,557
5 Claims. (Cl. 235—92)



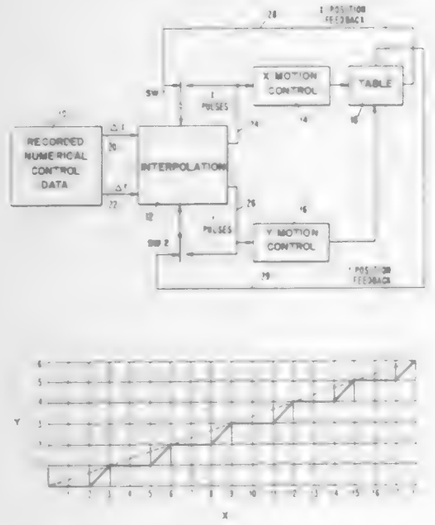
1. A system for counting vehicles as they pass a particular location along a right of way comprising, first and second wheel detectors disposed at spaced intervals along the right of way for providing outputs respectively each time a wheel of a vehicle passes in close proximity to the associated detector, said detectors being spaced a distance apart less than a distance between inside front and rear axles of any of the vehicles, reversible wheel counters for counting the outputs of the wheel detectors respectively, control means for causing said counters to operate through a complete cycle for each vehicle from a zero output count to a count of a total number of outputs for forward axles of a vehicle and return to zero count by subtracting counts of outputs for rear axles for that vehicle, said control means being operable in response to a particular count being made by at least one of the counters to reverse the counters after the outputs caused by passage of all forward axles of a vehicle have

been counted by both counters, respectively and means for generating a vehicle count output in response to the



actuation of at least one of the counters to a predetermined condition during the cycle of operation of that counter in counting outputs for the axles of each vehicle.

3,372,268
PULSE GENERATOR
Gerhard Emmerich Hoernes, Poughkeepsie, N.Y., assignor to International Business Machines Corporation, Armonk, N.Y., a corporation of New York
Filed Oct. 1, 1965, Ser. No. 491,993
4 Claims. (Cl. 235—151.11)



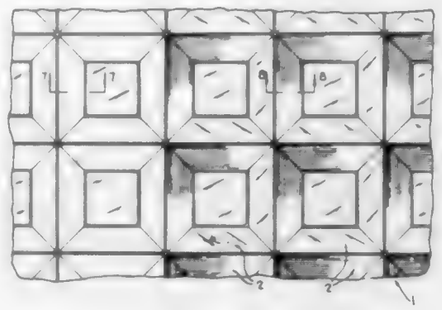
A positioning mechanism which responds to pulses supplied on a first and a second axis such that a movable element is moved along a slope. A pulse generator repetitively generates pulses on the *x* axis and generates a pulse on the *y* axis only when the pulse on the *y* axis will not cause the mechanism to be moved above the slope. An interpolator in the pulse generator subtracts the distance remaining to be moved in the *y* direction from the distance to be moved in the *x* direction repetitively until the result obtained is equal to or less than zero at which time a *y* pulse is emitted. For each subtraction, an *x* pulse is emitted. When the *y* pulse is emitted, the distance now remaining to be moved in the *x* and *y* directions is utilized in the calculations and the subtractions are performed again. This process continues until the distances in both directions are reduced to zero.

3,372,269
MULTIPLIER FOR SIMULTANEOUSLY GENERATING PARTIAL PRODUCTS OF VARIOUS BITS OF THE MULTIPLIER
Olin L. MacSorley and Frank R. Bielawa, Wappingers Falls, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Original application June 30, 1961, Ser. No. 121,024, now Patent No. 3,253,131, dated May 24, 1966. Divided and this application Oct. 22, 1965, Ser. No. 511,013
10 Claims. (Cl. 235—164)

1. A device for deriving the product of two numbers by generating and accumulating partial products, said device including means to store signals representative of a multiplicand, means to store signals representative of a multiplier, decoder means coupled to the means for storing signals representative of the multiplier which accepts signals in groups starting at the radix point and containing equal numbers of signals in each group, the decoder means operating in response to signals of each group to provide signals representing the numerical value of the group if it has an even value or representing a value of one greater than the numerical value if the value of the group is odd, means to represent the signals of each group as a positive number if the signals of the next higher order group represent an even value, means to obtain the difference between the value represented by the signals of each group and the radix value and represent the result as a negative number if the next higher order group has an odd value, multiple generation means coupled to the means for storing signals representative of the multiplicand for obtaining all even multiples of the multiplicand up to and including the radix times the multiplicand, the decoder means being coupled to the multiple generator means for selecting a corresponding multiple of the multiplicand in the multiple generator means, partial product accumulating means coupled to the multiple generation means for accumulating the selected multiples from said multiple generation means.

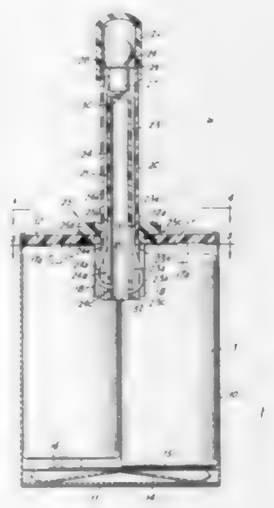
3,372,270
CEILING MODULES
Murray L. Quin, Overland, and Willard R. Garnett, Bellefountaine Neighbors, Mo., assignors to Emerson Electric Co., St. Louis County, Mo., a corporation of Missouri
Filed Sept. 22, 1965, Ser. No. 489,312
25 Claims. (Cl. 240—9)

A ceiling made up of ceiling modules each formed of four trapezoidal panels, each convergent edge of each of the panels being contiguous a convergent edge of another panel, the long bases of the panels lying in a common plane, and the short bases of the panels defining an open seat. A spine extends along and above each line of contiguity between adjacent panels and mounting means in the form of outwardly extending hooks are provided on the spines above the line of contiguity. A central closure



member openably mounted in the seat defined by the short bases of the trapezoids. The central closure member made up of a lamp housing and a light transmitting panel. Lamps mounted in the housing are offset vertically and cross intermediate their ends. Four modules supported at one corner by a single hanger.

3,372,271
BATTERY-OPERATED LIGHT
Douglas W. Rowed, East Lindfield, New South Wales, Norman D. Conran, Roseville, New South Wales, Neville J. Parker, Panania, New South Wales, Maurice L. Coates, Maroubra, New South Wales, and Edward L. Summers, Oyster Bay, New South Wales, Australia, assignors to Union Carbide Australia Limited, Sydney, New South Wales, Australia, a corporation of New South Wales
Filed Sept. 24, 1965, Ser. No. 490,049
4 Claims. (Cl. 240—10.64)

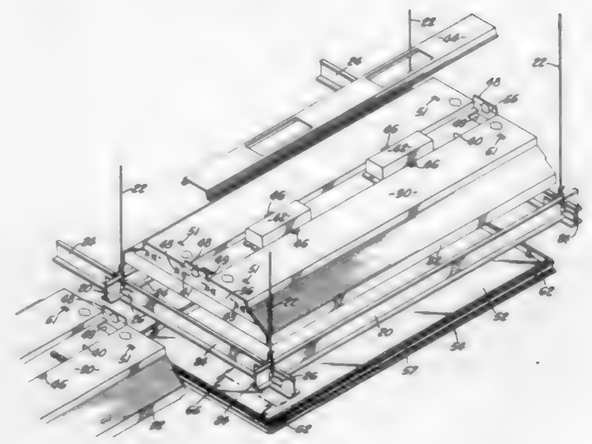


A battery-operated light consisting of a container having therein a cluster of battery cells arranged to form a central space therebetween for reception of a carrier standard for an electric lamp, the carrier standard being provided with electrical contact means for making and breaking a circuit between the battery cells and the electric lamp when the carrier standard is elevated from a fully nested position within the central space defined by the battery cells.

3,372,272
LIGHTING SYSTEM FOR FACILITATING THE DIAGNOSIS AND TREATMENT OF EYE DISORDERS
Donald W. Horley, Winchester, and Donald R. Korb, Boston, Mass., assignors to Donald W. Horley and Donald R. Korb, doing business as Boylston Research Associates, Boston, Mass., a partnership
Filed Dec. 7, 1965, Ser. No. 512,165
6 Claims. (Cl. 240—41.15)

A lighting unit for eye examination and treatment is arranged for suspension from the ceiling over a vertically adjustable patient's chair. The lighting unit includes five fixed 40 watt, 48 inch fluorescent bulbs, three of which produce black light for use in fitting contact lenses and are focused at the same point on the patient's eyes, a fourth of which provides direct white light and is also focused at that same point, and the fifth provides three levels of indirect white light. The lighting unit also includes a group of four 20 watt, 24 inch fluorescent lamps and a 3 watt incandescent lamp that is mounted behind the patient. A pushbutton control enables energization of the ten light sources at fixed intensity levels in different combinations to provide comprehensive accurate light environments for eye examination and treatment purposes.

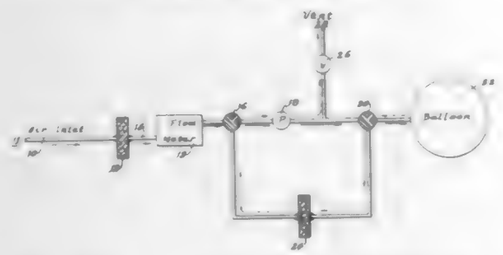
3,372,273
LIGHT FIXTURE FOR A SUSPENDED CEILING
Ormond S. Sutter, Placentia, Calif., assignor to Lok-Products Co., Fullerton, Calif., a corporation of California
Filed Mar. 8, 1965, Ser. No. 437,958
3 Claims. (Cl. 240—78)



A light fixture for suspended ceiling installations wherein a channel is formed along the upper surface of the reflector to form a wireway which can be adapted for easily

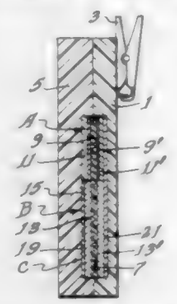
interconnecting a number of fixtures in a line, and further including a removable light diffuser.

3,372,274
INERT RADIOACTIVE FISSION GAS SAMPLER
Robert R. Landolt, West Lafayette, Ind., assignor to the United States of America as represented by the United States Atomic Energy Commission
Filed Jan. 26, 1966, Ser. No. 523,513
3 Claims. (Cl. 250—83)



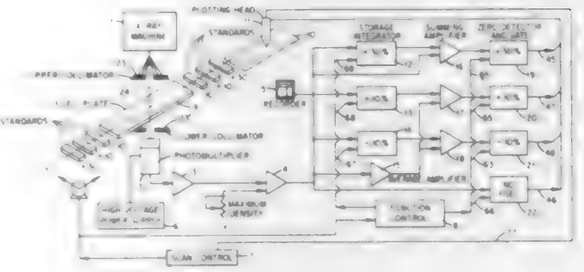
1. The method of measuring the radioactivity of an inert fission gas in a sample of a mixture of gases, comprising the steps:
removing all particulate matter from said sample, thereby obtaining a purified sample;
storing the purified sample in an airtight resiliently-expandable container for a predetermined time;
exhausting the contents of said collapsible container through a collecting means whereby particulate daughter products resulting from decay events occurring within said container are collected therein; and
measuring the radioactivity of the collecting means and the collapsed container to determine the amount of the particulate daughter present in the exhaust mixture;
whereby the quantity of radioactive inert fission gas present in the sample can be determined by the radioactivity decay characteristics of the inert fission gas.

3,372,275
NEUTRON FILM DOSIMETER USING MULTIPLE FILTERS
Leo F. Kocher, Richland, Wash., assignor to the United States of America as represented by the United States Atomic Energy Commission
Filed May 27, 1966, Ser. No. 554,292
7 Claims. (Cl. 250—83.1)



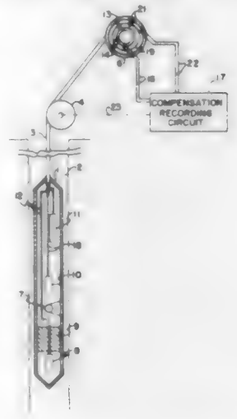
1. A film dosimeter adapted to be worn on the body, comprising at least one sheet of photographic film, three filters mounted adjacent to one face of said film, said filters having the following characteristics:
Filter A, comprising material which has a low capture cross-section for thermal neutrons and fast neutrons;
Filter B, comprising an inner layer adjacent the film having a high capture cross-section for thermal neutrons and an outer layer of a different material also having a high capture cross-section for thermal neutrons, both layers having low capture cross-sections for fast neutrons;
Filter C, comprising an inner layer of material adjacent the film which has a high capture cross-section for thermal neutron and an outer layer which has low capture cross-section for thermal neutrons, both layers having low capture cross-sections for fast neutrons;
Filters A, B and C being so designed as to give substantially equal absorption of photon radiation; and means for supporting said film and filters with the film adjacent the body.

3,372,276
METHOD AND SYSTEM FOR THE NON-DESTRUCTIVE INSPECTION OF VARIABLE DENSITY PLATES
Jay W. Reynolds, Oak Ridge, and Herman J. Stripling, Jr., Knoxville, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed May 21, 1965, Ser. No. 457,881
15 Claims. (Cl. 250—83.3)



A plate, having a plurality of different required area densities, and a plurality of corresponding standards are automatically inspected in a plurality of incremental longitudinal passes of the plate and standards between a source of penetrating radiation and a detector therefor to thus effect an inspection of the major portion of the plate. The plate inspection involves injecting data from the standards into circuitry for comparison with data derived from the plate itself, with the result that plate areas which are out-of-tolerance are indicated on a chart recorder.

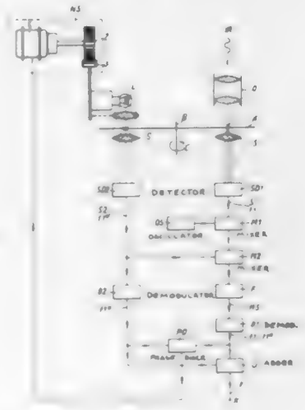
3,372,277
BOREHOLE ACTIVATION LOGGING SYSTEM COMPRISING VARYING STRATA IRRADIATION AS A FUNCTION OF THE RATE OF CHANGE OF TOOL VELOCITY
Arthur H. Youmans, Houston, Tex., assignor, by mesne assignments, to Dresser Industries, Inc., Dallas, Tex., a corporation of Delaware
Filed Dec. 24, 1963, Ser. No. 333,102
18 Claims. (Cl. 250—83.3)



1. A well logging instrument comprising:
a well logging tool adapted to be withdrawan from a well during logging operations;

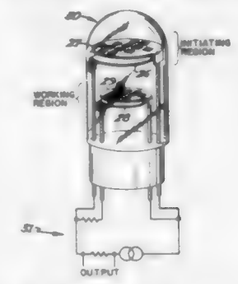
means disposed on said tool for irradiating the strata traversed by said tool;
a radiation detector responsive to radiation from said strata;
means for detecting variations in velocity of said tool while being withdrawn from said well; and
means for directly varying the irradiation to which said strata are subjected as a function of the rate of change of velocity of said tool thereby producing uniform irradiation of the strata.

3,372,278
APPARATUS FOR LOCATING SOURCES OF INFRARED RADIATION
Peter Aemmer, Milwaukee, Wis., assignor to Albiswerk Zurich S.A., Zurich, Switzerland, a Swiss corporation
Filed Feb. 9, 1966, Ser. No. 526,159
Claims priority, application Switzerland, Feb. 15, 1965, 2,025/65
5 Claims. (Cl. 250—83.3)



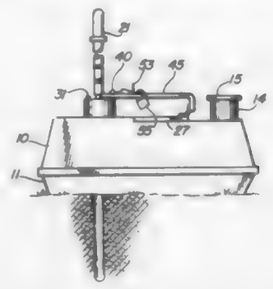
1. In apparatus for locating sources of infrared radiation by measuring at least one angular coordinate relative to the optical axis of the apparatus, said apparatus having a first radiation detector, an objective for projecting an image of the source-containing space onto said first detector, and a scanning member disposed between said detector and said objective for causing said detector to issue for each infinitesimal image element a first oscillating and frequency-modulated signal, the improvement which comprises a second radiation detector on one side of said scanning member, an internal auxiliary radiator situated on the other side of said scanning member for irradiating said second detector through said scanning member to produce in said second detector a second oscillating and frequency-modulated signal, said radiator being displaceable relative to said second detector for adjusting the phase position of said second signal relative to the phase position detectors for mixing said first and second signals, a filter connected to said mixer stage for furnishing a modulated of said first signal, a mixer stage connected to said two mixed signal, a frequency discriminator stage connected to said mixer stage for demodulating said mixed signal, a second frequency discriminator stage connected to one of said two detectors for demodulating the signal issuing therefrom, a phase discriminator connected to said two frequency discriminator stages for measuring the phase angle between the two demodulated signals, said phase discriminator having an output voltage indicative of said phase angle, positional control means mechanically connected with said auxiliary radiator and electrically connected to said phase discriminator for displacing said radiator in the phase-angle reducing sense under control by said output voltage, and an adding stage connected to said two frequency discriminator stages and having an output voltage corresponding to the sum of said two demodulated signals and indicative of the angular coordinate being measured.

3,372,279
ULTRAVIOLET SENSITIVE GEIGER-MUELLER TYPE RADIATION DETECTOR
Robert O. Engh and Robert G. Johnson, Hopkins, Minn., assignors to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed May 6, 1965, Ser. No. 453,792
12 Claims. (Cl. 250—83.6)



An ultraviolet detector having an anode-cathode arrangement providing an initiating region wherein discharge occurs in response to detected radiation and an anode-cathode arrangement providing a working region to which the discharge is subsequently transferred.

3,372,280
SAFETY HANDLE AND PROBE FOR PORTABLE SURFACE GAUGE USING RADIOACTIVE SOURCE
David B. Auld, 3123 Childers St., Andrew Lowery, 4901 Grinnell Drive, and Robert F. Penny, Rte. 1, Justice Drive, all of Raleigh, N.C. 27609
Continuation of application Ser. No. 290,539, June 25, 1963. This application Jan. 20, 1966, Ser. No. 560,396
3 Claims. (Cl. 250—106)

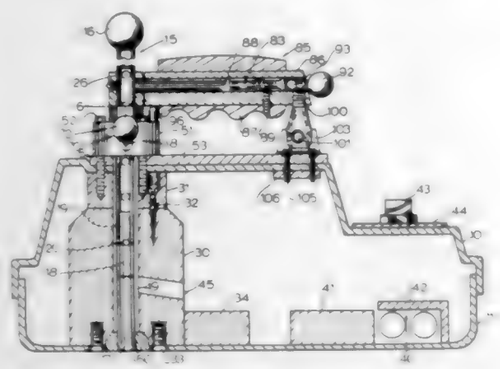


A portable radioactive surface gauge employs a probe rod which mounts a radioactive source and which is constructed so that it will interlock with the handle of the gauge only when the probe rod source is in a shielded above-surface position. The probe can otherwise be releasably secured for measuring in various sub-surface, direct transmission, positions. The handle remains useful as a handle when the probe rod, which is removably mounted in the gauge, is completely removed.

3,372,281
HANDLE-PROBE CONSTRUCTION FOR PORTABLE AND SUBSURFACE DENSITY GAUGE USING RADIOACTIVE SOURCE
David B. Auld, Raleigh, Robert W. Faulkner, Knightdale, and Andrew Lowery, Durham, N.C., assignors to Troxler Electronics Laboratories, Inc., Raleigh, N.C., a corporation of North Carolina
Filed Dec. 31, 1964, Ser. No. 422,796
3 Claims. (Cl. 250—106)

A cooperative probe and handle structure for a radioactive measuring gauge adapts the gauge source to surface

back-scatter measuring positions, subsurface direct transmission measuring positions and shielded transport positions. The gauge handle is hollow and mounts a locking device which locks the probe and handle and makes the



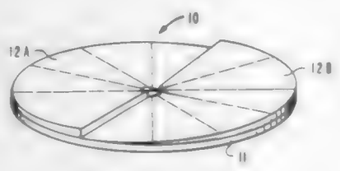
handle useful as a handle only when the probe is positioned so that the source is shielded. The gauge probe can be releasably locked in various positions such that the source can be placed in corresponding subsurface direct transmission positions or in a surface back-scatter position.

3,372,282

COLOR CODING OPTICAL RETICLE

Martin Bressler, Covina, Calif., assignor to Aerojet-General Corporation, El Monte, Calif., a corporation of Ohio

Filed Apr. 29, 1965, Ser. No. 451,911
5 Claims. (Cl. 250—236)



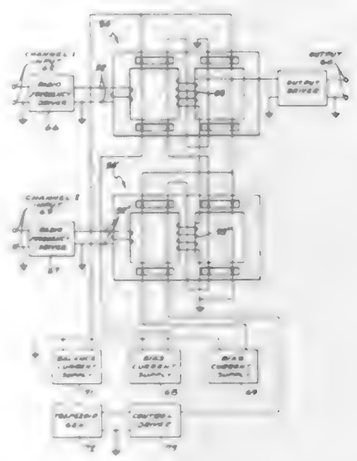
This disclosure concerns a color coding optical reticle for an optical system useful in detecting and tracking sources of infrared radiation. The reticle comprises a circular base of light-transmitting material, such as quartz, having a planar surface, and a coating disposed on the planar surface of the base. The coating comprises a material having light-absorptive and light-transmitting qualities so as to transmit a particular range of light wavelengths therethrough while absorbing other light wavelengths falling outside of the range. One such suitable material for the coating is germanium which transmits light in the infrared part of the spectrum, while absorbing a high percentage of light occurring in the visible part of the spectrum. The coating is of a specific variable thickness enabling the reticle to act as an optical wedge, wherein light incident thereon produces linear interference fringes because of interference occurring in light reflected by the reticle. These linear interference fringes are indicative of the particular wavelengths of light to which the reticle is exposed. Upon rotating the reticle at a constant angular velocity, the linear interference fringes produced thereon code the light incident to the optical system and to the reticle forming a component thereof as a composite frequency signal which is converted to a variable electrical signal by a light detector in registration with the reticle. The variable electrical signal from the detector may be analyzed so as to separate and compare the various spectral constituents of the light incident to the optical system.

3,372,283

ATTENUATION CONTROL DEVICE

Andre A. Jaecklin, Palo Alto, Calif., assignor to Ampex Corporation, Redwood City, Calif., a corporation of California

Filed Feb. 15, 1965, Ser. No. 432,500
12 Claims. (Cl. 307—83)



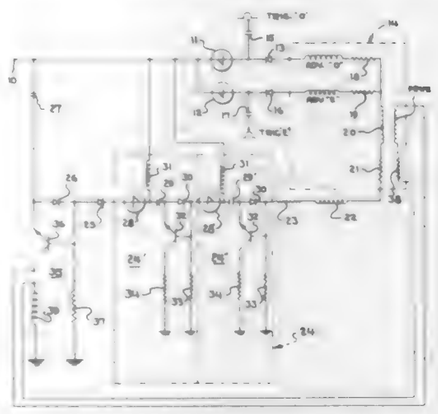
A transformer wherein attenuation of signals coupled between input and output windings on a core is controlled by varying the saturation of flux paths through the core between the windings. Very high level attenuation and a substantially linear attenuation control characteristic are obtained by the employment of a differential transformer configuration wherein input windings on two outer legs of a core are arranged to induce equal fluxes therein in directions of mutual opposition in a central leg of the core upon which an output winding is wound. Saturation inducing control windings in push-pull on legs interconnecting the outer and central legs vary the flux differential in the central leg to vary the attenuation of a signal coupled between the input and output windings in accordance with a control signal applied to the control windings. The transformer has varied utility as a slow switcher, automatic gain control, phase detector, analog adder, analog multiplier, etc.

3,372,284

VOLTAGE-MULTIPLYING DRIVE CIRCUIT FOR MAGNETIC CORE DEVICE

Keith Henry Dormer, Harrisburg, and Charles Thomas Wyrick, Camp Hill, Pa., assignors to AMP Incorporated, Harrisburg, Pa.

Filed Aug. 20, 1964, Ser. No. 390,980
16 Claims. (Cl. 307—88)



1. An electronic circuit comprising a pair of solid state switch means connected to be alternatively driven to conduction, an input for applying a substantially constant voltage to said switch means, means in circuit with each

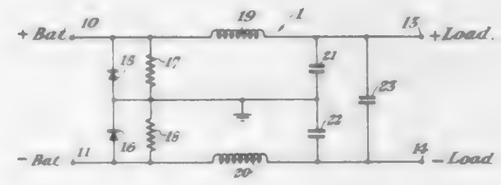
switch means and responsive to conduction thereof to produce output pulses, means connected to said last-mentioned means to delay conduction of said switch means to provide control current and to provide proper sequential conduction thereof, and voltage-multiplying means in said output pulse producing means to provide increased voltage.

3,372,285

TRANSIENT VOLTAGE SUPPRESSORS

Frank V. Blazek, Monroeville, and Chalmers W. Gilbert, Penn Hills Township, Allegheny County, Pa., assignors to Westinghouse Air Brake Company, Swissvale, Pa., a corporation of Pennsylvania

Filed Oct. 9, 1964, Ser. No. 402,868
6 Claims. (Cl. 307—93)



The present invention relates to an improved transient voltage suppressor for protecting solid state apparatus by subduing high voltage surges or transients which might appear on a source of power. The transient voltage suppressors comprises a three terminal network consisting of a plurality of diodes, resistors, capacitors and inductors for providing protection from each side of the power source to ground as well as across each side of the power source. The diodes are serially connected from line to line with the intermediate junction connected to ground. Similarly, the resistors are serially connected from line to line with their intermediate junction also connected to ground. Likewise, a pair of capacitors are serially connected from line to line with their intermediate junction also being connected to ground. An additional capacitor is connected between line to line, and an inductor is connected in each line between the source and load terminals. Accordingly, the voltage suppressor is capable of handling surges or spikes of either alternating or direct current types which may occur from line to line or line to ground.

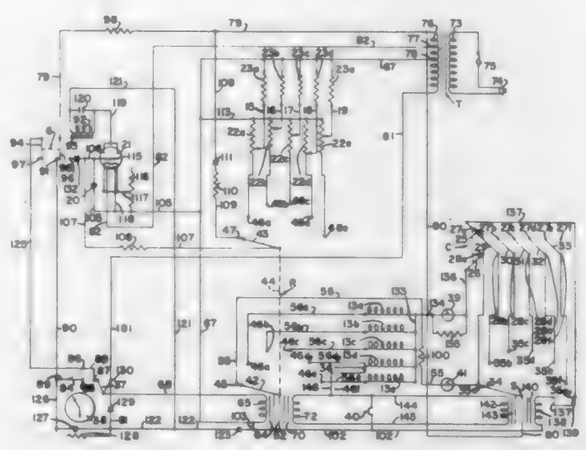
SPRINKLER SYSTEM CONTROL APPARATUS

Orlo Rotunda, 1720 9th St., Greeley, Colo. 80631

Filed Aug. 20, 1964, Ser. No. 390,846
8 Claims. (Cl. 307—141.4)



The subject matter is an automatic sequence control for a multi-bank lawn sprinkling system or the like, having a plurality of electrical actuators, such as solenoid valves. The sequence control includes two stepper relay switches adapted to operate in unison. The circuit extending from the first step of the first stepper relay is a starter circuit which includes a normally open switch adapted to be momentarily closed by a clock mechanism at selected time intervals, such as 24 hours. Circuits extend from the other contacts of this first stepper relay to the solenoid valves. The final step of the sequence on this first stepper relay includes a circuit to return the stepper arm to its initial position.

The starter circuit is adapted to swing the arm of each stepper from its first step contact to the next step in sequence and a pulser circuit is adapted to thereafter swing each arm from one step contact to the next. This pulser circuit includes a tube which functions as an electronic gate and flow of current is prevented in this circuit as long as there is a charge upon the grid of this tube. A timer circuit connects with this tube grid and includes a capacitor adapted to hold a charge on the grid. The charging and discharging of this capacitor operates the pulser circuit. A first charging circuit connects with the first step of the second relay to charge the capacitor at the initiation of the operation of the control. A second charging circuit, including a normally open relay switch, is connected with the timer circuit and is actuated by the relay solenoid in the pulser circuit to close the switch and charge the capacitor whenever a current is flowing in the pulser circuit and when the stepper arms are stepping.

Resistor leads connect with the subsequent contacts of the second relay and each circuit formed through this relay, as the arm of the relay moves from one contact to the next, is adapted to short the timer circuit to discharge the capacitor. However, the resistance in each lead permits only a slow leakage of current from the capacitor, sufficient to establish a selected time interval before the capacitor is discharged and current may again flow through the pulser circuit.

Additional features of this apparatus may include a manual switch for starting and stopping the apparatus at will. Such feaure may also include a third stepper type control adapted to shift one step once for each complete cyclic operation of the first two steppers with the leads of this third stepper interposed in the electrical auctuator leads, to allow or prevent operation of the electrical actuators during a cycle of operation of the sequence control, such, for example, as on alternate days.

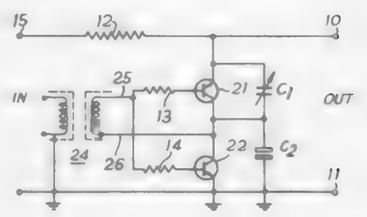
SUPPRESSION OF TRANSIENTS AT THE OUTPUTS OF TRANSISTOR SWITCHING CIRCUITS

Eric Metcalf, Headley, Bordon, England, assignor to The Solartron Electronic Group Limited, Farnborough, England, a British company

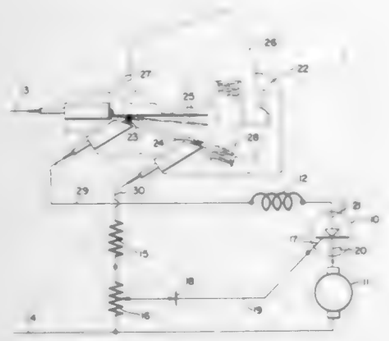
Filed Mar. 8, 1965, Ser. No. 437,664
11 Claims. (Cl. 307—240)



A circuit for connecting and disconnecting two terminals is described, which uses two transistors with their emitter-collector paths back to back, or one double emitter transistor with its emitter-collector paths back to back. A switching voltage is applied to the transistor or transistors when they are to conduct, and the switching voltage is prevented from reaching the two terminals by the

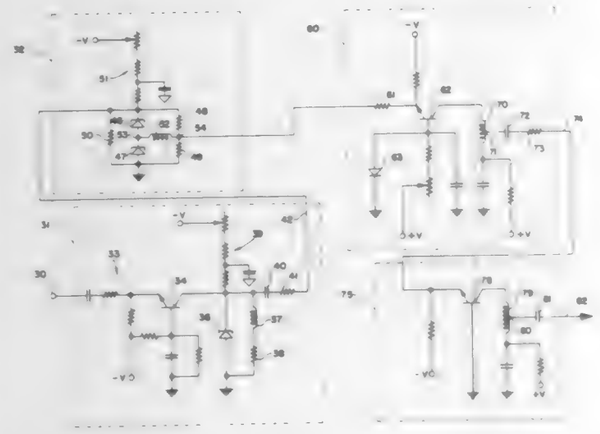
addition of a capacitor or capacitors to the circuit, connected as part of a balanced bridge circuit. The switching voltage is applied across opposite corners of the bridge, and the two terminals form another pair of opposite corners.

3,372,288
SEQUENTIAL SWITCHING WITH DELAY FOR CONTROLLED RECTIFIER CIRCUITS
Jerry Wigington, Pickens, S.C., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Aug. 24, 1964, Ser. No. 391,589
6 Claims. (Cl. 307—252)



A switching circuit employs a manually-operated sequential switch having two pairs of contacts and a single actuator for connecting and disconnecting an A.C. voltage to and from a circuit in which a semi-conductor rectifier having a signal current path controls a power current path to a load. The contact pairs are arranged mechanically to be closed and opened in a time sequence with a specified minimum time delay related to the period of the A.C. voltage. One pair of contacts applies A.C. voltage to the power current path and the other pair of contacts applies A.C. voltage to the signal current path.

3,372,289
TUNNEL DIODE BINARY OUTPUT CIRCUIT
Donald G. Meyer, San Pablo, Calif., assignor to Beckman Instruments, Inc., a corporation of California
Filed June 30, 1965, Ser. No. 468,219
9 Claims. (Cl. 307—286)



1. An output circuit for use with a tunnel diode binary circuit, the tunnel diode binary circuit including a pair of series connected tunnel diodes connected to a bias source, first and second series connected resistances shunting said tunnel diodes, and a memory inductance connected from the junction of the tunnel diodes to the junction of said resistances, the improvement comprising

an output terminal for said binary circuit connected to the junction of said resistances,

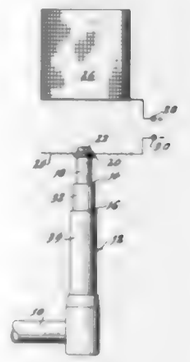
an amplifier,

said output terminal being connected through a third resistance to the input of said amplifier,

a current transformer, and

the output of said amplifier being connected through said transformer to an output terminal.

3,372,290
ELECTRICAL GENERATOR
Edmund S. Sowa, Westmont, and Charles J. Divona, Lockport, Ill., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed May 11, 1965, Ser. No. 455,020
3 Claims. (Cl. 310—5)



1. Apparatus for generating an electrical potential comprising:

a source of pressurized vapor;

means for forming said vapor into a high-velocity jet;

means having a surface fixed substantially normal to the flow direction of said vapor jet for abruptly deflecting said vapor jet, the relative motion of the vapor jet with respect to the deflecting surface being sufficient to cause a shock wave in the region of deflection whereby the vapor passing through said shock wave is ionized;

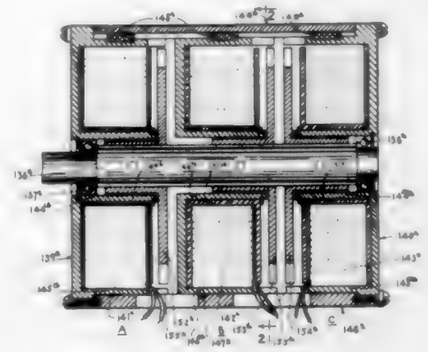
first conducting means located directly beyond the region of deflection and in the direction of flow of the deflected vapor for contacting said deflected vapor and collecting negative charge; and

second conducting means located further in the direction of flow than said first conducting means for contacting said vapor and collecting residual positive charge, whereby an electrical potential is built up between said first and second conducting means.

3,372,291
MOTOR DRIVES FOR CONTROL RODS OF REACTORS, AND THE LIKE
Chester W. Lytle and William A. Bradley, Albuquerque, N. Mex., and Robert V. Suhrke, Colorado Springs, Colo., assignors to Thomas A. Banning, Jr., Chicago, Ill.
Original application June 20, 1960, Ser. No. 37,503, now Patent No. 3,264,502, dated Aug. 2, 1966. Divided and this application Aug. 1, 1966, Ser. No. 578,951
4 Claims. (Cl. 310—49)

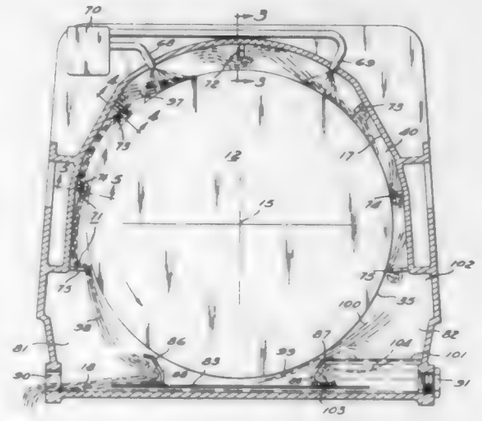
A stepping motor having a plurality of circular sections, each section including a stator and magnetic disk rotor

in axial alignment with each other and all elements having equally angularly spaced teeth. The stator and rotor of



each section are in full registry, upon the sequential energization of each section.

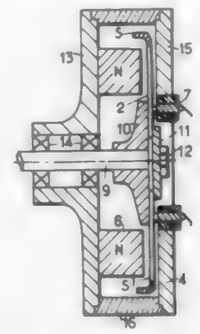
3,372,292
LIQUID-COOLED EDDY CURRENT DEVICE
Donald L. Lynch, Chagrin Falls, and Alexander K. Zweede, Euclid, Ohio, assignors to The Reliance Electric and Engineering Company, a corporation of Ohio
Filed Oct. 27, 1964, Ser. No. 406,790
16 Claims. (Cl. 310—105)



The disclosure shows an eddy current device, a clutch or brake, which is water-cooled by water spraying on the exterior passive surface of the eddy current drum. Centrifugal force of the rotating drum throws the water off and circumferential air flow caused by the rotating drum causes this water to travel circumferentially around the housing inner surface. Baffles are mounted on this housing inner surface to redirect the water several times onto the drum exterior surface to extract more heat from the drum to increase the power rating. A false bottom raised above the floor of the housing permits water to run underneath this false bottom to a drain in a lower corner of the housing.

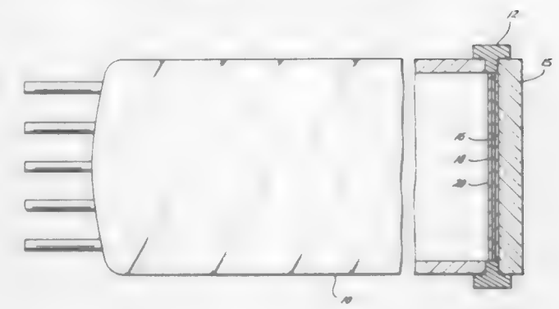
3,372,293
DISCOIDAL ELECTRIC ROTARY MACHINES
Jacques Henry-Baudot, Antony, France, assignor to Societe d'Electronique et d'Automatisme, Courbevoie, France
Filed July 27, 1964, Ser. No. 385,242
Claims priority, application France, Sept. 4, 1963, 946,579, Patent 1,375,231
9 Claims. (Cl. 310—268)

1. A low voltage high direct current dynamo-electric machine of the disc rotor type comprising in combination: a stator including an heteropolar field structure of permanent magnet poles and defining a magnetic airgap wherein the orientation of the magnetic field regularly reverses in successive zones; a disc shaped rotor rotatably mounted within said airgap, said rotor comprising a plurality of conductor blades arranged in at least one layer with their greater dimensions substantially oriented along the greater direction of the airgap, said blades being at least partly bare on one of their faces near at least one end



thereof; and brushes mounted in registration with the magnetic pole axes of said field structure and interconnected to D.C. transducing terminals, each one of said brushes electrically contacting and short-circuiting at least two of said conductor blades at ends and means for electrically connecting together other ends of said conductor blades to complete an electrical circuit only through those conductor blades which are in direct contact with said brushes.

3,372,294
CAMERA TUBE TARGET INCLUDING POROUS PHOTOCONDUCTIVE LAYER COMPRISING ANTIMONY TRISULFIDE, FREE ANTIMONY AND COPPER PHTHALOCYANINE
James K. Fisher, Garland, Tex., assignor to General Electrodynamics Corporation, Garland, Tex., a corporation of Texas
Continuation-in-part of application Ser. No. 452,640, May 3, 1965. This application July 29, 1966, Ser. No. 568,823
1 Claim. (Cl. 313—65)



A television camera tube having a photosensitive surface containing an inorganic photoconductor and a minor proportion of an organic photoconductor, such as copper phthalocyanine.

3,372,295
AIR PROPORTIONAL ALPHA DETECTOR
James R. Sparks, Albuquerque, N. Mex., assignor to the United States of America as represented by the United States Atomic Energy Commission
Filed Mar. 3, 1966, Ser. No. 533,387
2 Claims. (Cl. 313—93)

An air proportional alpha detector having a removable screen sealed with an aluminized "Mylar" film removably

mounted on a metal coated plastic housing, and a removable detector unit positioned within the housing adjacent the screen and including a plurality of longitudinal

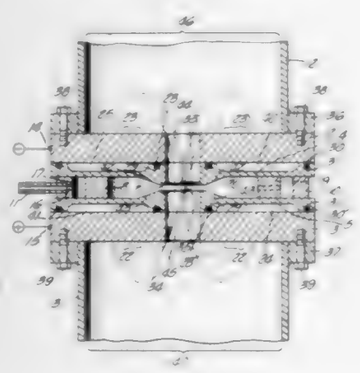
channels each having a wire independently suspended along the channel and an aluminized Mylar film seal adhesively bonded over the channels sealing the detector unit.

3,372,296

ARC PLASMA ELECTRODE PAIR HAVING A VENTURI-SHAPED CONFIGURATION

John Tom Naff, Costa Mesa, Calif., assignor to Automatic Fire Control Inc., South El Monte, Calif., a corporation of California

Filed Apr. 4, 1967, Ser. No. 628,355
5 Claims. (Cl. 313—231)



This invention relates to an arc reactor electrode configuration useful in generating an arc suitable for heating substances by passage through the arc plasma. A simple, replaceable parallel annular plate anode and cathode pair can be quickly replaced on wear.

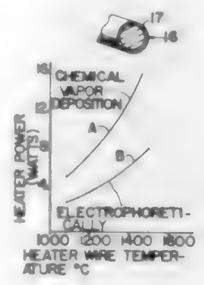
3,372,297

HIGH FREQUENCY ELECTRON DISCHARGE DEVICES AND THERMIONIC CATHODES HAVING IMPROVED (CVD) REFRACTORY INSULATION COATED HEATER WIRES

Cortland S. Pearsall, Los Altos, and Ray T. Wimber, San Diego, Calif., assignors to Varian Associates, Palo Alto, Calif., a corporation of California

Filed Sept. 28, 1964, Ser. No. 399,461
17 Claims. (Cl. 313—337)

The heat transfer adherence, coating resistance, density and electrolytic degradation characteristics of a coated heater for use in a thermionic cathode are improved by utilizing a chemical vapor deposited (CVD) refractory insulation coating on a refractory metal heater wire. The terminology (CVD) is restricted to include only coatings which are formed by the deposition of a non-volatile compound on a selected substrate from a gas (vapor) or mixture of gases, said mixture containing all the chemical elements required to synthesize the desired compound in the form of one or more gaseous compounds differing from the following compound. The deposition may take place either by thermal decomposition of a gas or by chemical reaction of the gas mixture constituents at the substrate which has been raised to a suitable temperature.

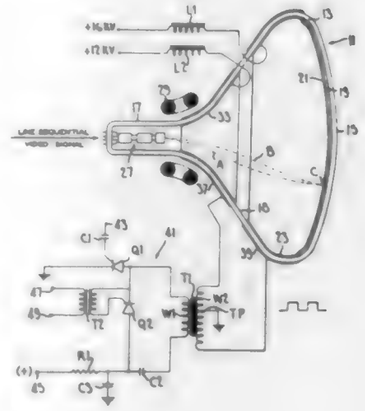


3,372,298

COLOR DISPLAY SYSTEM

Jerry D. Murryman, Dallas, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Filed May 31, 1966, Ser. No. 553,771
9 Claims. (Cl. 315—14)



1. A color display system comprising:

a kinescope including,

an envelope of dielectric material, said envelope having a face portion, a neck portion and an intermediate portion connecting said neck portion to said face portion,

a phosphor screen on the inner surface of the face portion of said envelope, said phosphor screen including a plurality of phosphors which emit light of different colors when struck by electrons of different energies,

a first conductive band around the inner surface of the intermediate portion of said envelope adjacent said phosphor screen and electrically connected thereto for applying electron accelerating voltages to the screen,

a single electron gun in the neck portion of said envelope for emitting a beam of electrons toward said screen,

a second conductive band around the inner surface of the intermediate portion of said envelope adjacent said neck portion forming a generally annular electrode which is substantially concentric with said gun and axially displaced therefrom toward said screen,

a third conductive band substantially equidistantly spaced outwardly away from said first band and in substantial juxtaposition therewith, said first and third bands forming with said envelope a capacitor for coupling time-varying signals from said third band to said first band, and

a fourth conductive band substantially equidistantly spaced outwardly away from said second band and in substantial juxtaposition therewith, said second and fourth bands forming with said envelope a capacitor for coupling time-varying signals from said fourth band to said second band;

means for applying D.C. bias voltages to said first and second bands to accelerate electrons emitted from said gun toward said screen;

field generating means for deflecting said beam of electrons in a scanning raster; and

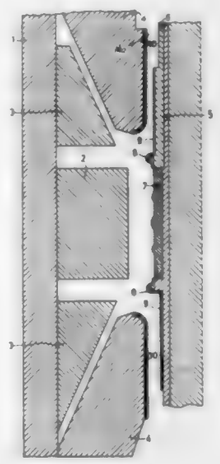
means for applying out-of-phase time-varying voltages to said third and fourth bands whereby electrons emitted from said gun are accelerated to at least two different energies for energizing said screen to produce multiple-color images having color image components which are in substantial registration.

3,372,299

RESONANT CAVITY MAGNETRON HAVING BUILT-IN MAGNETIC POLE SHOES WITH AN ELECTRICALLY CONDUCTIVE METAL COATING TO PREVENT FLASH-OVER TO THE CATHODE

Johannes Antonius van de Goor, Emmasingel, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

Filed Sept. 16, 1964, Ser. No. 396,883
Claims priority, application Netherlands, Sept. 18, 1963, 298,079
3 Claims. (Cl. 315—39.71)



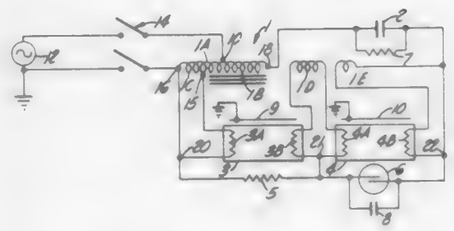
In a magnetron having built-in substantially conical perforated pole-shoes between which the ends of a cathode extend, at least the surface of the edge of the pole-shoes facing the cathode consists of refractory, electrically conductive metal such as molybdenum to prevent flash-over and reduce sputtering and evaporation of cathode material.

3,372,300

SEQUENTIAL STARTING CIRCUIT FOR A PAIR OF FLUORESCENT LAMPS

Shungo Furui, Yokohama, Japan, assignor of fifty percent to Grace Thunberg, Garden Grove, Calif.

Filed July 29, 1965, Ser. No. 475,682
7 Claims. (Cl. 315—96)



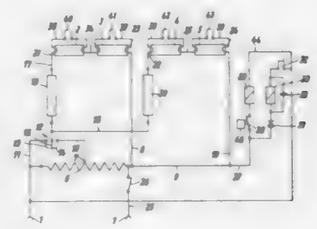
To light tubes are connected in series with a current supply and are lit in sequence during the starting operation. A relatively high resistance is permanently connected across one of the tubes and a glow switch starter is connected across the other of the tubes such that the requirement of a conventional ballast is obviated.

3,372,301

METHOD FOR IGNITING SEVERAL FLUORESCENT LAMPS AND CIRCUIT ARRANGEMENT FOR CARRYING OUT THIS METHOD

Henry Elfers, Hamburg, Germany, assignor to Lumoprint Zindler K.G., Hamburg, Germany, a corporation of Germany

Filed Nov. 5, 1963, Ser. No. 321,613
Claims priority, application Germany, Nov. 15, 1962, L 43,456
10 Claims. (Cl. 315—106)



8. A circuit arrangement for operating a plurality of fluorescent lamps connected in a common circuit and each having a pair of heaters energizable for the passage of an electric current through said heaters preparatorily to the illumination of said lamps and sustaining a discharge through said lamps for illumination thereof, said circuit arrangement comprising:

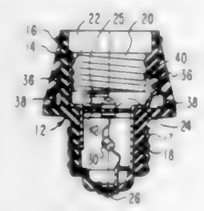
a high-voltage source capable of effecting discharge through said lamps upon the heating thereof and a low-voltage source of a level insufficient to ignite said lamps;

a two-position switch in circuit with said heaters and having a first position wherein said low-voltage source is connected across said heaters and a second position wherein said high-voltage source is connected across said heaters; and

a control network energized by said high-voltage source for initiating said discharge through said lamps, said network including an operating switch, and means operatively connecting said operating switch and said two-position switch for operating same after the lapse of a period of energization of said heaters in said first position of said two-position

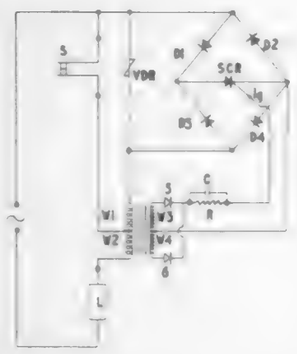
switch to shift same to said second position and apply high voltage to said heaters prior to the initiation of said discharge.

3,372,302
ADAPTOR MECHANISM FOR LIGHT CIRCUITS
Henry Fasola, Los Angeles, Calif., assignor to California Computer Products, Inc., Anaheim, Calif., a corporation of California
Filed Apr. 21, 1964, Ser. No. 361,325
7 Claims. (Cl. 315—272)



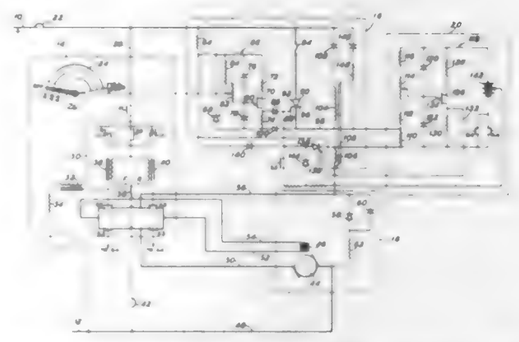
1. An adaptor mechanism for light circuits, comprising: a body structure having a base portion including a threaded member for engagement in mating relation with a conventional on-off type light socket and having a pair of electrical terminals arranged to make contact with corresponding terminals of the socket; a body structure socket portion adjacent to said base portion, including a threaded member for engagement in mating relation with a base of a single-filament light bulb having two terminals at the bulb base, said socket portion having a pair of terminals for contacting the light bulb base terminals; a diode rectifier connected to one of said terminals of said socket portion for blocking part of the applied alternating current energizing the light bulb; and said body structure including switch means for alternately opening and closing a circuit path bypassing the diode rectifier for establishing dual levels of illumination in the associated light bulb.

3,372,303
A.C. SWITCH CONTACTS
Leonard George Walter Knott, Hounslow, Middlesex, England, assignor to F. Devetta (Electronics) Limited, Hounslow, Middlesex, England, a British company
Filed Feb. 17, 1966, Ser. No. 528,304
Claims priority, application Great Britain, Sept. 28, 1965, 41,276/65
5 Claims. (Cl. 317—11)



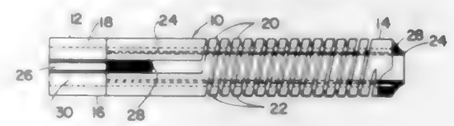
1. A device for connection across a pair of A.C. switch contacts comprising at least one silicon controlled rectifier connectable in parallel with the contacts for carrying current in either direction, split transformer means part in series with the contacts and part in series with the S.C.R. and means for deriving a control signal for the S.C.R. from the transformer means whereby the current which would otherwise produce arcing or sparking is passed through the S.C.R. and the S.C.R. is de-triggered thereby so that it switches off when the voltage across it has zero value.

3,372,304
OVERLOAD PROTECTION FOR SCR MOTOR CONTROL CIRCUIT
John J. Kuipers, Palos Heights, Ill., assignor, by mesne assignments, to Westinghouse Air Brake Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 6, 1964, Ser. No. 409,431
12 Claims. (Cl. 317—33)



This invention relates to a motor control circuit in which the motor current is controlled by the combination of a silicon controlled rectifier and a saturable reactor. In particular, the invention relates to an overload protection circuit for the SCR. The invention also includes a filter to damp out undesirable transients.

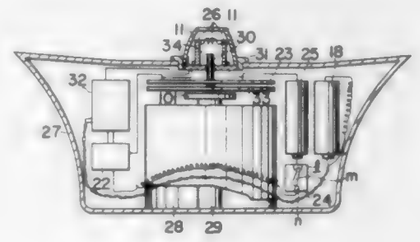
3,372,305
SILICON CARBIDE IGNITER
Anthony R. Mikulec, Snyder, N.Y., assignor to The Carborundum Company, Niagara Falls, N.Y., a corporation of Delaware
Filed Apr. 15, 1966, Ser. No. 542,939
7 Claims. (Cl. 317—98)



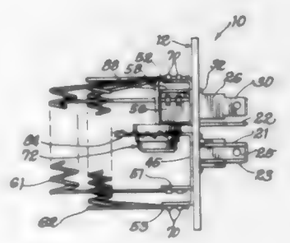
1. An igniter element comprising: an elongated hollow body composed of a non-metallic resistance material having a first portion comprising a pair of laterally spaced elongated members having outer surfaces and a second portion comprising a pair of spaced helical bands connected to and extending longitudinally from said elongated members, respectively, and terminating in an end portion; an elongated support member disposed within said body and secured adjacent the opposite ends thereof to said body with adhesive material; a coating of electrical conducting material deposited on said outer surfaces of said elongated members adjacent the ends thereof remote from said helical bands; and a polarizing key secured with said adhesive material between said elongated members adjacent the ends thereof remote from said helical bands.

3,372,306
PROXIMITY CONTROLLED AUTOMATIC CIGARETTE LIGHTER AND THE LIKE
Hiroyasu Koizumi, Yokohama-shi, Japan, assignor to Kobayashi Shinijiro, Tokyo, Japan
Filed Sept. 14, 1965, Ser. No. 487,147
Claims priority, application Japan, Sept. 15, 1964, 39/52,564
6 Claims. (Cl. 317—85)

In an electrically ignited gas fueled cigarette lighter, opening and closing of the fuel valve which connects the liquid reservoir with the discharge nozzle of the lighter is effected automatically upon placing a cigarette or the like at a predetermined position close to the outlet opening of said nozzle, by means of an electric proximity control circuit including sensing means influenced by the cigarette, to effect a current change in said circuit suitable for the opening of said valve via a solenoid or the like control device. According to one embodiment, the control circuit is in the form of a self-running high-frequency oscillator subjected to the varying capacity between said sensing means and the metal mass of the device, to start and stop the oscillation of the circuit. Alternatively, the proximity control is by means of a light beam being intercepted by the cigarette and impinged upon a photoelectric cell forming part of the control circuit. Simultaneously with the opening of the fuel valve, a heater also controlled by said circuit and disposed in the vicinity of the capacitative or optical sensing means may be energized to ignite the fuel jet, whereby to completely dispense with any manual operations in the use of the lighter. Upon removal of the lighted cigarette, the circuit returns to its normal or rest condition ready for a renewed operation.

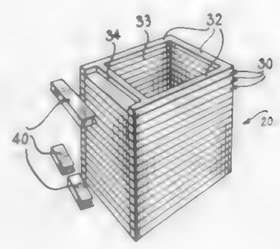


3,372,307
RESISTOR AND RECTIFIER UNIT
Michael F. Bedocs, Wilmette, Ill., assignor to Indak Manufacturing Corp., Northbrook, Ill., a corporation of Illinois
Filed Dec. 23, 1965, Ser. No. 516,009
10 Claims. (Cl. 317—100)



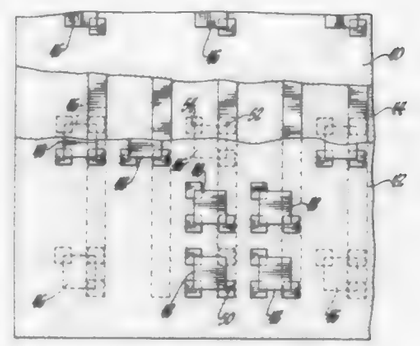
4. In an electrical device,
the combination comprising an insulating support,
a plurality of terminal members mounted on said support,
one of said terminal members having a flange thereon projecting away from said support,
said flange having a substantially circular opening therein,
a rectifier having a casing securely mounted in said opening,
said flange having a plurality of fins thereon radiating from said flange around said opening for dissipating the heat generated in said rectifier during use.

3,372,308
INTERCONNECTING FRAME ASSEMBLY WITH IMPROVED CONNECTOR STRUCTURE
Rocco J. Noschese, Rowayton, Conn., John C. Sarazen, Mansfield, Mass., and Nathaniel C. Williams, New Brunswick, N.J., assignors to Burndy Corporation, a corporation of New York
Filed Aug. 26, 1965, Ser. No. 482,806
8 Claims. (Cl. 317—101)



The electronic circuit assemblies are formed of a plurality of modular units, and a unique assembly of interconnecting frame elements which individually support separate circuit arrays.

3,372,309
MULTILAYER ELECTRONIC MODULE
Ralph W. Stockdale, Greendale, Wis., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 23, 1965, Ser. No. 516,012
2 Claims. (Cl. 317—101)

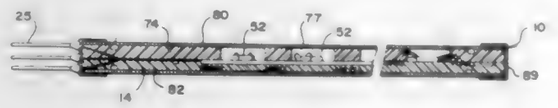


A printed circuit module contains a plurality of stacked interconnected substrates, each substrate bearing a plurality of identical components arranged in a preordered pattern. Some substrates will have only patterns of conductors thereon. Circuit interconnections are achieved by forming conductors in holes drilled through a stack of substrates and selectively making contact with certain components and conductors.

3,372,310
UNIVERSAL MODULAR PACKAGES FOR INTEGRATED CIRCUITS
Misha Kantor, Orlando, Fla., assignor to Radiation Incorporated, Melbourne, Fla., a corporation of Florida
Filed Apr. 30, 1965, Ser. No. 452,184
5 Claims. (Cl. 317—101)

1. An integrated circuit package, comprising a plurality of microelectronic circuit components, an insulating substrate having a plurality of groups of parallel conductors extending longitudinally along one surface thereof and transversely along another surface thereof op-

posite said one surface, said groups of conductors on each surface spaced from each other by a distance sufficient to accommodate the bonding of said microelectronic circuit components to insulative portions of said surfaces, said microelectronic circuit components bonded to said substrate in the spaces between said groups of conductors, a predetermined pattern of conductors extending between said surfaces and interconnecting various longitudinal and transverse conductors at crossover points thereof to form

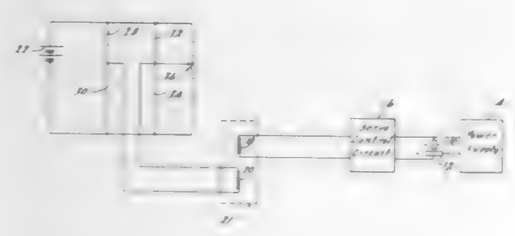


an intraconnected conductor matrix, means electrically connecting said microelectronic circuit components to said matrix to form the desired integrated circuit, a pair of cover plates insulatively spaced from said opposite surfaces, means hermetically sealing said substrate, said components, said matrix, and said cover plates in a modular package, and means at least partially encompassing the edges of said package for absorbing impact loads and vibrations to which said package is subjected.

3,372,311
BALANCING CIRCUIT FOR ELECTRICALLY CONTROLLED HYDRAULIC SERVO SYSTEMS

Walter Lobur, Clawson, Mich., assignor to Elox Corporation, Troy, Mich., a corporation of Michigan

Filed Sept. 16, 1965, Ser. No. 487,843
10 Claims. (Cl. 317—123)



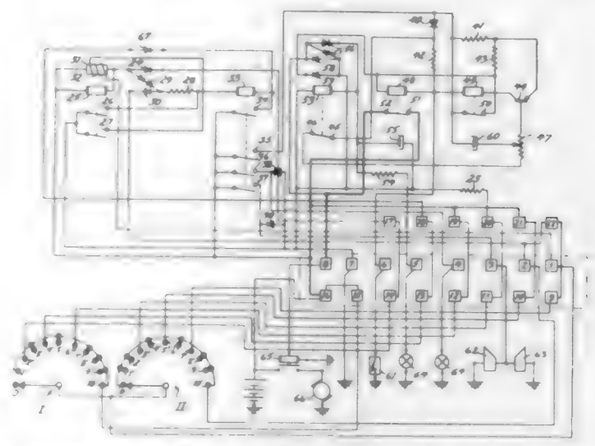
1. In an electrically operated hydraulic system having a servo valve responsive to an electrical control signal provided thereto, an adjustable balancing system for said servo valve comprising, a bias coil operatively connected to control said servo valve, a DC source, a first pair of substantially equal value, relatively low impedance resistors connected across said source, a second pair of substantially equal value, relatively low impedance resistors connected across said source, a potentiometer including a movable contact and having a linear resistance of relatively high impedance connected across said source, said bias coil having one terminal connected to the junction of said first pair of resistors and the other terminal connected to the junction of said second pair of resistors and to said movable contact of said potentiometer for manipulative adjustment.

3,372,312
ELECTRICAL SYSTEM

Artur Sirringhaus, Dortmunder Landstrasse 61, Herdecke-Ende, Germany

Filed Oct. 15, 1964, Ser. No. 404,037
Claims priority, application Germany, July 31, 1964, S 92,392
11 Claims. (Cl. 317—134)

A system for simultaneously and automatically unlocking the doors of a vehicle, turning on the ignition of the vehicle engine, and actuating the self-starter mechanism for such engine, with such system including a pair

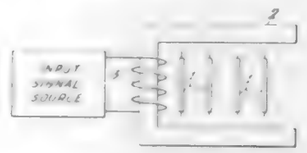


of rotary switches provided with different settings adapted to accommodate currents of opposite polarities.

3,372,313
SEQUENTIAL MULTIPLE CONTACT SINGLE CORE SWITCH APPARATUS UTILIZING GLASS ENCLOSED CONTACTS

Francis J. Beck, Philadelphia, Pa., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware

Filed Dec. 2, 1964, Ser. No. 415,254
8 Claims. (Cl. 317—137)

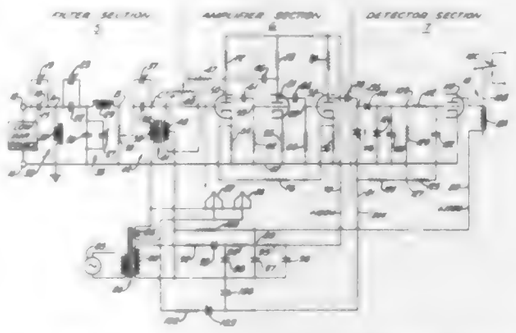


A sequential switching apparatus having glass-enclosed switches positioned between the legs of a U-shaped core piece. A coil is wound upon the core piece for providing an electromagnetic flux within the core. Each glass-enclosed switch is arranged at a different respective distance from the coil to provide the sequential switching as an electrical signal within the coil varies.

3,372,314
MEANS AND TECHNIQUES USEFUL IN TONE RECEIVERS

Jud C. Chastain, West Covina, Calif., assignor to American Meter Company, Inc., Fullerton, Calif., a corporation of Delaware

Filed Mar. 31, 1965, Ser. No. 444,352
6 Claims. (Cl. 317—147)



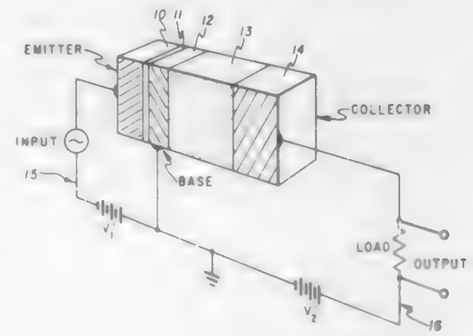
A tone receiver for a telemeter system has a signal applied thereto. When the signal is applied a relay is energized and when the signal is keyed off, there is no signal at the output terminal and the relay is deenergized.

The relay is operated at a fast rate in that the pull-in current is that current required to cause its armature to be moved to its attracted position; and the drop-out current is just that amount of current at which the armature is maintained in its attracted position. The band width of the amplifier circuit is established by three tuned filter sections with the band width being adjusted relative to the keying frequency.

3,372,315
ELECTRON TUNNEL EMISSION DEVICE EXHIBITING APPROXIMATELY 0.9 CURRENT TRANSFER RATIO

Thomas E. Hartman, Richardson, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Continuation of application Ser. No. 477,274, Aug. 4, 1965. This application Feb. 27, 1967, Ser. No. 619,074
2 Claims. (Cl. 317—235)

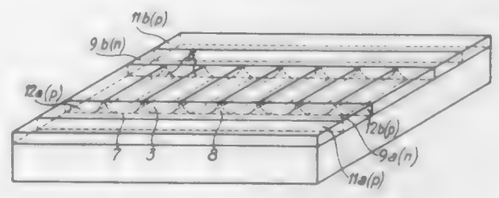


1. A solid-state electron device comprising first, and second conductive metal layers separated by a first insulating layer, said second conductive metal layer being aluminum and having a thickness of about 70 Angstrom units, said first insulating layer being aluminum oxide and having a thickness from about 25 to about 50 Angstrom units, a layer of mica adjacent said second conductive metal layer, said layer of muscovite having a thickness from about 100 to about 10,000 Angstrom units, a third conductive metal layer adjacent said layer of muscovite and opposite said second conductive metal layer, and bias means on said first and second metal layers for producing a current transfer of approximately 0.9.

3,372,316
INTEGRAL GRID AND MULTICHANNEL FIELD EFFECT DEVICES

Stanislas Teszner, 49 Rue de la Tour, Paris, France

Filed July 24, 1964, Ser. No. 385,023
Claims priority, application France, July 26, 1963, 942,896
3 Claims. (Cl. 317—235)

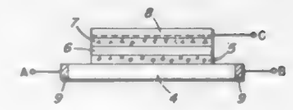


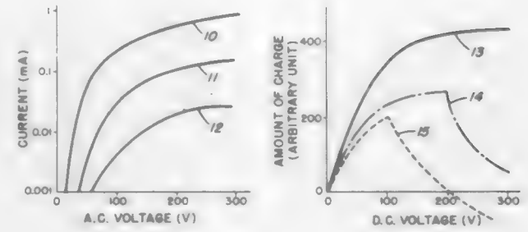
1. A field-effect multichannel semiconductor device comprising: a semiconductor wafer of a given type of conductivity; a surface layer of the opposite type of conductivity on one of the faces of said wafer and forming a plane junction therewith; parallel spaced-apart strips of said opposite type conductivity in said surface layer forming, respectively, a source and a drain interconnected by a plurality of parallel channels of said opposite type of conductivity lying between said strips; and elongated inclusions of said given conductivity type embedding said channels and forming a gate junction therewith, the channels having a cross section in the shape of a triangle with a rectilinear base along said plane junction and with two concave curvilinear sides along said inclusions, the altitude of the triangle being substantially equal to one-half of the length of said base; said inclusions being adjacent and integral with each other at the free surface of said layer and extending therethrough to reach onto said plane junction; with said curvilinear sides of said elongated channels forming quarter-cylindrical borders.

3,372,317
PHOTOELECTRIC DEVICE

Akio Yamashita, Ikeda-shi, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan, a corporation of Japan

Original application Mar. 10, 1964, Ser. No. 350,833. Divided and this application May 11, 1966, Ser. No. 566,698
5 Claims. (Cl. 317—235)



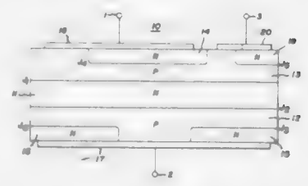


A semiconductor device for converting and/or controlling an electrical input, comprising successive layers of a first semiconductor, a mixture of a first electrical insulator and a second semiconductor, a second electrical insulator, a photosensitive member, and a transparent electrode.

3,372,318
SEMICONDUCTOR SWITCHES

Edward G. Tefft, Auburn, N.Y., assignor to General Electric Company, a corporation of New York

Filed Jan. 22, 1965, Ser. No. 427,393
4 Claims. (Cl. 317—235)

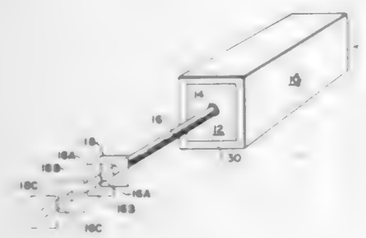


A semiconductor bilateral gate fired switch is provided which utilizes both junction and remote gate firing modes and a confined localized low resistance current path is provided between the gate electrode and the nearest device main emitter junction in order to assure that the current density required for switching the device is obtained at a low value of gate current and to achieve gate firing with a low gate voltage.

3,372,319
SENSING ELEMENT FOR PROXIMITY DETECTORS AND THE LIKE

William E. Rhodes, Columbus, Ohio, assignor to Robertshaw Controls Company, Richmond, Va., a corporation of Delaware

Filed May 23, 1966, Ser. No. 552,068
6 Claims. (Cl. 317—256)

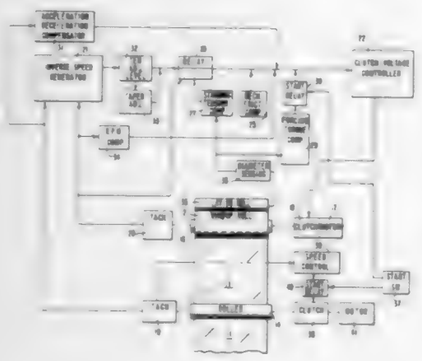


Capacitance type sensing elements are provided for extending the range of detection of proximity detecting devices, which sensing elements include a dielectric base plate in an exterior housing wall of the sensing device and conductive coupling means therein adapted to receive one end of an extended or elongated conductive support means maintaining a conductive plate or plates at selected distances from the sensing device.

3,372,320
WEB WINDING APPARATUS

Mardell L. Boyum and Peter F. Grinnell, Clinton, Iowa, assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed May 12, 1965, Ser. No. 455,264
15 Claims. (Cl. 318—7)



1. Winding apparatus comprising

a rotatable member adapted to be driven by a drive motor;

an adjustable magnetic clutch operatively connected between said rotatable member and the drive motor;

advancing means adapted to advance a web of material to be wound into roll form on the rotatable member;

means adapted to transmit motive power to said magnetic clutch responsive to a control signal from a tension control means adapted to generate a control signal proportional to the ratio of the rotational speed of the advancing means and the rotatable member and bias signals selected from any one of:

an acceleration-deceleration control means adapted to generate a bias signal proportional to the speed of said advancing means;

a first adjustable friction control means adapted to generate a fixed bias signal;

a second adjustable friction control means adapted to generate a bias signal proportional to the speed of the rotatable member;

an adjustable forcing torque control means adapted to generate a bias signal proportional to the size of the roll of wound web material;

an adjustable standing tension control means adapted to generate a bias signal proportional to the size of the roll of wound web material;

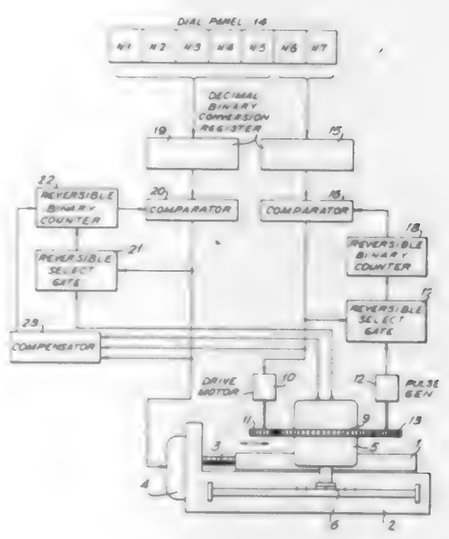
and an adjustable tension taper control means adapted to generate a bias signal of fixed percentage of the tension control signal;

for rotating said rotatable member and maintaining a uniform tension pattern between the core and the outer periphery of the wound web material.

3,372,321
DIGITAL SYSTEM FOR CONTROLLING THE POSITION ALONG A GIVEN PATH OF A MOVABLE STRUCTURE

Seiuemon Inaba and Kanryo Shimizu, Kawasaki, Tokiji Shimajiri, Mitaka-shi, and Yoshibiro Hashimoto, Nakaku, Yokohama, Japan, assignors to Fujitsu Limited, Kawasaki, Japan, a corporation of Japan

Continuation-in-part of application Ser. No. 618,233, Feb. 23, 1967. This application June 22, 1967, Ser. No. 648,054
Claims priority, application Japan, Jan. 11, 1963, 38/1,160
7 Claims. (Cl. 318—18)

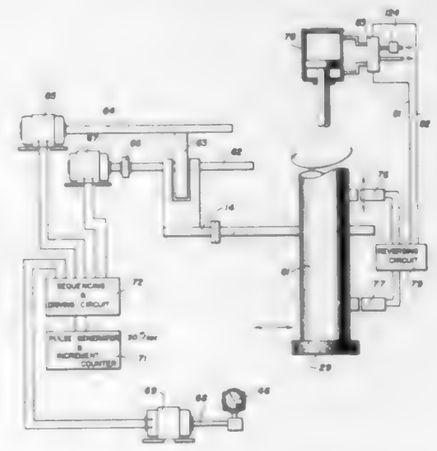


A drive is coupled to a movable structure for displacing it. A detector mounted on a fixed structure and on the movable structure, detects positional variation of the movable structure along the path thereof. The detector comprises a scale affixed to one of said structures and comprising a plurality of spaced indications. An optical detecting element is movably mounted on the other of the structures in operative proximity with the scale. The detector includes zero range device for providing a zero range at a given interval for each indication of the scale. A datum setter has a first portion selectively adjustable for setting the major amount of a desired positional datum value and a second portion selectively adjustable for setting the residual amount of the datum value. A presetting control is coupled to the optical detecting element for moving it relative to the structure in accordance with the residual amount. The presetting control comprises a first register having a content equal to that of the second portion of the datum setter. A servomotor is coupled to the optical detecting element for moving it along the given path. A pulse generator is coupled to the optical detecting element for providing pulses corresponding in number to the displacement thereof. A first counter has an input connected to the pulse generator for counting pulses generated thereby. A first comparator has an output connected to the servomotor, an input connected to the output of the first counter and an input connected to the output of the first register for comparing the contents of the first register and the first counter and for energizing the servomotor until coincidence of the contents of the first register and first counter. A drive control is coupled to the drive and comprises a second register having a content equal to that of the first portion of the datum setter. A second counter has an input connected to the detector for counting pulses generated by the detector. A second comparator has an output connected to the drive, an input connected to the output of the second counter and an input connected to the output of the second register for comparing the contents of the second register and the second counter for energizing the drive until coincidence of the contents of the second register and second counter. A zero compensator has an output connected to an input of the second counter, an input connected to the output of the first comparator, an input connected to the output of the second comparator and an input connected to the detector for selectively varying the count of the second counter in accordance with indications outside the zero range.

3,372,322
STEPPING MOTOR FEED FOR A GRINDER INCLUDING A HIGH SPEED SLEWING MOTOR

George H. Lockwood, Worcester, Glenn D. Johnson, Sterling, Edward G. Robillard, Leicester, and Henry E. Hirvi, Paxton, Mass., assignors to The Heald Machine Company, Worcester, Mass., a corporation of Delaware

Continuation of application Ser. No. 316,756, Oct. 16, 1963. This application July 11, 1967, Ser. No. 652,625
3 Claims. (Cl. 318—39)

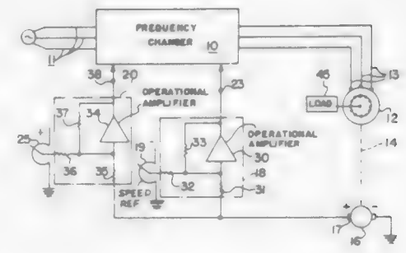


The present invention relates to a grinding machine, more particularly, to a grinding machine having a feedscrew for moving the wheel head to bring about a machining operation, the feedscrew being operated by a stepping motor which in turn receives pulses from a generator; a means is provided for regulating the transmission of the pulses to the motor and restricting the said transmission to the time when the spindle is at the end of a longitudinal stroke. In addition, means is provided for transmitting selectively pulses of substantially different frequency.

3,372,323
INDUCTION MOTOR SLIP FREQUENCY CONTROL SYSTEM

John C. Guyeska, Newbury, Ohio, assignor to Reliance Electric and Engineering Company, a corporation of Ohio

Filed Mar. 31, 1965, Ser. No. 444,193
19 Claims. (Cl. 318—230)

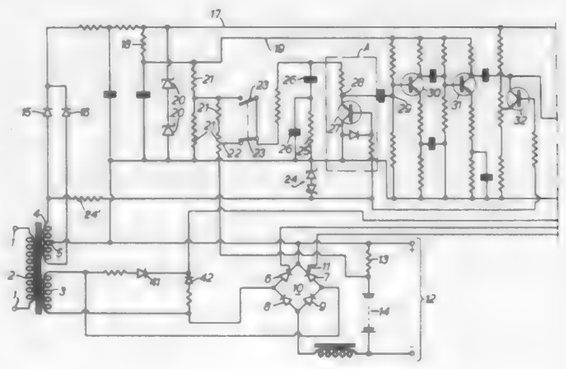


The invention relates to frequency changers supplying an alternating voltage to an induction motor at a variable frequency to control the speed of the motor. The slip of the motor is maintained at a fixed or predetermined maximum value regardless of speed change or load change in the motor. This fixed or determined slip is established by a slip reference voltage with the magnitude of the voltage determining the amount of the slip of the motor. A tachometer generator supplies a signal proportional to motor speed with this tachometer generator algebraically combined with a speed reference voltage and the difference being an error signal to control the voltage output of the frequency changer. Additionally the tachometer voltage is combined with a slip reference voltage and the algebraic sum is used to control the frequency of the output of the frequency changer.

3,372,324
D.C. POWER SUPPLY ARRANGEMENTS

John Alan Scarlett, Maldon, England, assignor to The Marconi Company Limited, London, England, a British company

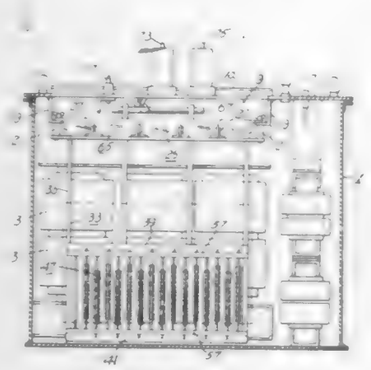
Filed Oct. 18, 1965, Ser. No. 497,241
Claims priority, application Great Britain, Aug. 3, 1965, 43,206/64
9 Claims. (Cl. 320—39)



A D.C. power supply arrangement employing a floating battery, the power supply arrangement is adapted for connection to an A.C. source, a rectifier circuit is employed for supplying charging current to the battery through a resistor in series with the battery. The charging current supplied to the battery is monitored and the time duration per A.C. cycle during which charging current is

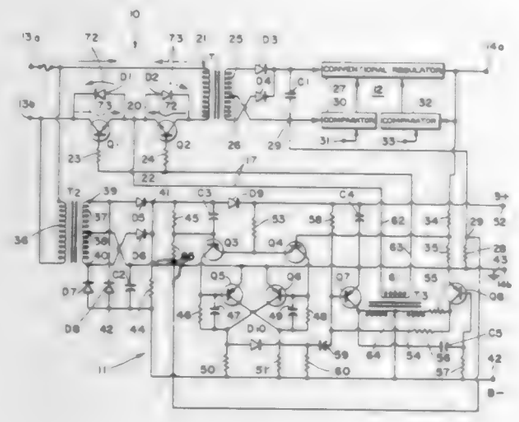
supplied to the battery is varied in accordance with an increase or a decrease in charging current level above or below a predetermined desired level thereof.

3,372,325
READILY SERVICEABLE POWER SUPPLY ASSEMBLY
Wallace W. Wahlgren, Oakland, Calif., assignor, by mesne assignments, to The Rucker Company, Oakland, Calif.
Filed Nov. 13, 1964, Ser. No. 410,983
4 Claims. (Cl. 321—8)



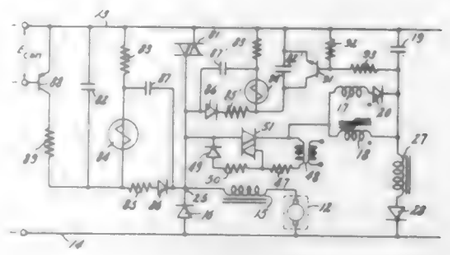
A readily serviceable power supply in which a rectifier rack is insertable through an opening in the transformer cover, to automatically effect circuit connections within the transformer casing, through complementary terminal strips.

3,372,326
HIGH EFFICIENCY LOW IRON AC-TO-REGULATED DC CONVERTER
Boris Stefanov, 5628 Harold Way, Los Angeles, Calif. 90028
Filed Apr. 30, 1965, Ser. No. 452,083
8 Claims. (Cl. 321—24)



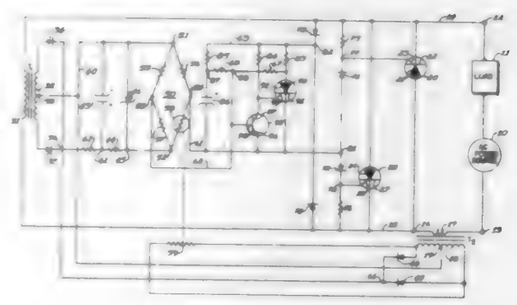
This disclosure relates to a power supply in which the primary of the input transformer is in series with a switch that is closed only for a very short time during the rising portions of the input AC sine wave half-cycles. The switch closing pulses are positioned such that the energy storage capacitor incorporated in the circuit is charged to a voltage determined by the control circuit providing the pulses. As a result, the input transformer size (iron content) can be reduced by a factor of from 10 to 20, and the regulator heat is minimized since the storage capacitor is never charged to a voltage higher than necessary.

3,372,327
TIME RATIO CONTROL AND INVERTER POWER CIRCUITS
Raymond E. Morgan, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Original application Dec. 26, 1963, Ser. No. 334,690. Divided and this application May 12, 1967, Ser. No. 639,594
8 Claims. (Cl. 321—43)



A family of time ratio control D-C power circuits comprises a load current carrying SCR, triac, diac, or dv./dt. fired SCR which is turned on and commutated off at desired intervals to supply power to the load, which is connected in series with a filter inductance and in parallel with a coasting diode for inductive loads. The commutation circuit comprises a commutating capacitor in series with a parallel-connected linear inductance and saturable reactor and with an auxiliary SCR-diode combination or triac. The capacitor-linear inductance are tuned to series resonance at a frequency substantially lower than the commutating frequency, while the capacitor-saturable reactor are tuned to series resonance at the commutating frequency. For power generating loads, a coasting-feedback triac, diac, or dv./dt. fired SCR is connected in parallel with the load and a bidirectional load current carrying device is used to return power to the supply and thereby provided a second mode of operation for the circuit. Inverters employ two cooperating pairs of circuits.

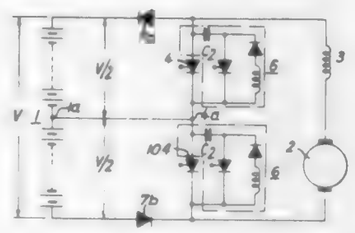
3,372,328
SCR TEMPERATURE CONTROL CIRCUIT
Balthasar H. Pinckaers, Edina, Minn., assignor to Honeywell Inc., a corporation of Delaware
Filed Nov. 14, 1964, Ser. No. 413,431
8 Claims. (Cl. 323—22)



A solid state thermostat having only two input wires in which both a voltage transformer and a current transformer are used to sequentially provide power to the thermostat. The power contacts of the thermostat comprise a bidirectional solid state controlled rectifier means. A primary winding of a current transformer is serially connected with the power contacts across the two wire AC input terminals. The AC source and load are connected to these terminals. A voltage transformer primary winding is connected across the power contacts. The voltage transformer or the current transformer provides power, de-

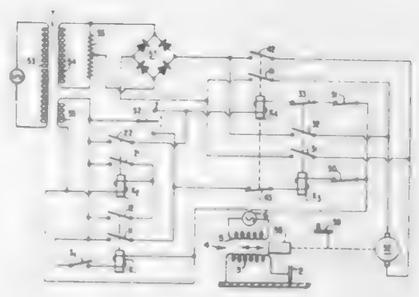
pending on whether the contacts are open or closed, to a temperature-responsive bridge circuit which provides a signal to close the contacts.

3,372,329
VOLTAGE CONTROL SYSTEM
Karl Steimel, Konigstein-Johanniswald, Taunus, and Klemens Heumann, Berlin-Reinickendorf, Germany, assignors to Licentia Patent-Verwaltungs-GmbH, Frankfurt am Main, Germany
Filed Sept. 24, 1963, Ser. No. 311,162
Claims priority, application Germany, Sept. 27, 1962, L 43,082
17 Claims. (Cl. 323—22)



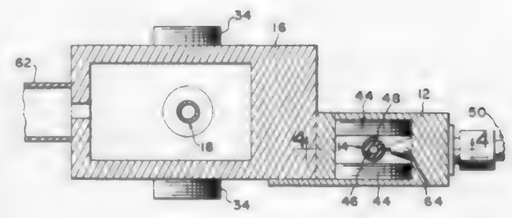
1. A circuit arrangement comprising, in combination:
(a) a first component incorporating a direct current source of electric energy;
(b) a second component connected across said first component incorporating a load;
(c) tap means on one of said components and dividing the same into at least two portions;
(d) a series circuit connected across said one of said components, said series circuit including at least two controllable semiconductor elements connected in series by at least one connector; and
(e) circuit means connecting said tap means to said connector.

3,372,330
ARC WELDING DECAY HEAT CONTROL SYSTEM WITH MOVABLE CASE TRANSFORMER
Robert A. Piscitello Uncasville, Arthur E. Petit, Hadlyme, and Bernard V. Wolski, Waterford, Conn., assignors to General Dynamics Corporation, New York, N.Y., a corporation of Delaware
Filed Jan. 14, 1964, Ser. No. 337,652
9 Claims. (Cl. 323—51)



8. A decay heat control system for electric arc welding machines of the motor driven movable core type comprising a core drive motor, first and second switching means, either of said switching means controlling both the decay cycle and selective adjustment of said core, said switching means when actuated to a first position causing said core to be driven by said motor from an initial setting to a zero current output setting, said switching means, upon release from the first position, causing said core to be driven by said motor towards the initial setting a memory means for terminating the drive motor operation when the core reaches said initial setting, and said switching means allowing selective adjustment of the core position when actuated to a second position.

3,372,331
GYROMAGNETIC SPECTROMETER HAVING A TAPERED DIELECTRIC TRANSITION BETWEEN A COAXIAL LINE AND A HELIX STRUCTURE
John D. Larson, Palo Alto, Calif., assignor to Varian Associates, Palo Alto, Calif., a corporation of California
Filed Jan. 25, 1965, Ser. No. 427,869
7 Claims. (Cl. 324—.5)

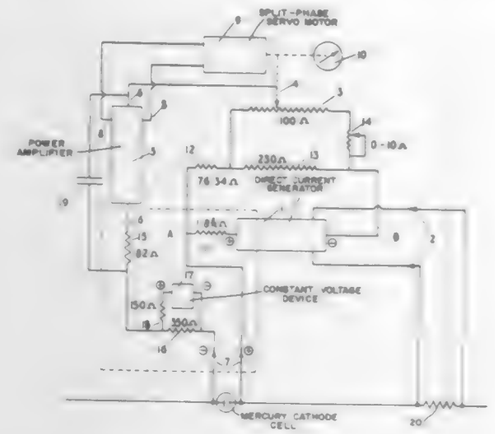


A gyromagnetic resonance spectrometer is disclosed for observing electron paramagnetic resonance of a sample under analysis. The spectrometer includes a probe structure having separate unknown sample and reference sample enclosures immersed in a common unidirectional polarizing magnetic field. Microwave energy is applied separately to both of the samples within their respective enclosures to excite resonance of both samples. Microwave energy is applied to the reference sample enclosure by means of a coaxial line coupled to a helix structure within the reference sample enclosure. The helix structure surrounds the reference sample and a tapered dielectric bead impedance matching transition is provided between the coaxial line and the helix structure. A second coaxial line is connected to the helix structure for observing resonance of the reference sample. A similar tapered dielectric bead impedance matching transition is provided between the output coaxial line and the helix structure. Various tapers are taught for the dielectric bead transition in order to obtain reflectionless impedance matches to the helix structure.

3,372,332
METHOD AND APPARATUS FOR ELECTRICAL RESISTANCE MEASUREMENT
Peter Ralph Michell and Frederick George Packham, Runcorn, England, assignors to Imperial Chemical Industries Limited, London, England, a corporation of Great Britain
Filed July 19, 1965, Ser. No. 472,908
Claims priority, application Great Britain, Aug. 12, 1964, 32,850/64
11 Claims. (Cl. 324—30)

5. An apparatus suitable for measuring the electrical resistance of a circuit element which is carrying a direct current, which comprises a voltage-operated direct current generator, a potentiometer resistor having an adjustable tapping, a voltage amplifier, a servo-mechanism and an indicator scale, said voltage-operated current generator being connected for receiving an externally applied first input voltage and for feeding the whole or part of a current output through the said potentiometer resistor, said adjustable tapping on the potentiometer resistor being connected for applying to the input terminals of the said voltage amplifier in series opposition to a second externally applied input voltage a fraction of the voltage developed across the potentiometer resistor, said servo-mechanism being mechanically connected to the said po-

tentiometer tapping and to the said indicator scale and being electrically linked with the output terminals of the said voltage amplifier in such a sense that when there is an output from the voltage amplifier the servo-mechanism



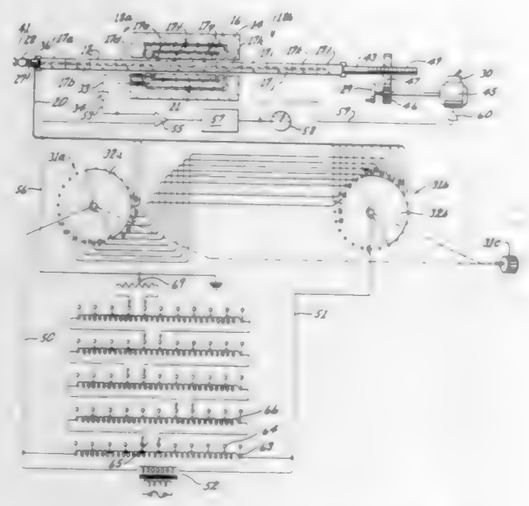
moves the tapping on the potentiometer resistor towards a position giving zero output from the amplifier and produces on the indicator scale a reading corresponding to the position of the said tapping.

3,372,333
DIFFERENTIAL CAPACITOR TRANSDUCER APPARATUS HAVING COARSE AND FINE ADJUSTMENTS AND MEANS FOR CHANGING SCALE SPAN

Robert E. Esch, Kettering, Ohio, assignor to The Sheffield Corporation, Dayton, Ohio, a corporation of Delaware

Continuation-in-part of application Ser. No. 250,536, Jan. 10, 1963. This application Sept. 28, 1964, Ser. No. 399,548

1 Claim. (Cl. 324—98)



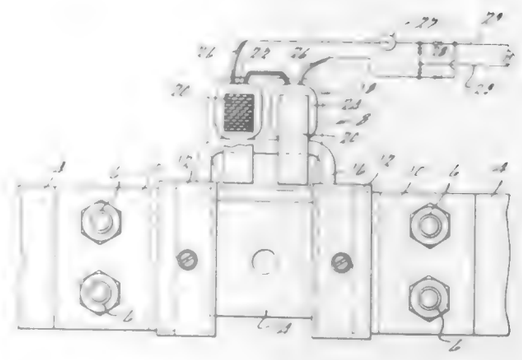
A position responsive measuring device having a differential capacitor transducer comprising a plurality of capacitive elements, means for shifting an electrical dividing line along the elements, and a pickoff capacitive membet. Indicating apparatus provide indications of the displacement of the pickoff member from the electrical dividing line. A plurality of operational mode control systems and mode selection devices are operated in conjunction with the transducer.

3,372,334
CALIBRATED BYPASS CONDUCTOR CURRENT MEASURING SYSTEM

Charles E. Fenoglio, Detroit, and Michael A. Koltuniak, Warren, Mich., assignors to The Udylite Corporation, Warren, Mich., a corporation of Michigan

Filed Mar. 25, 1964, Ser. No. 354,574

2 Claims. (Cl. 324—126)



A system for measuring the amount of current flow in a bus conductor which includes a shunt conductor connected in series with the bus conductor and a calibrated bypass conductor connected in shunt relation with the shunt conductor so that a predetermined portion of the main current flows between the shunt conductor and the bypass conductor. The system further includes a transductor for inductively sensing the current flow in the bypass conductor to provide an output signal, the amplitude of which varies in accordance with the amount of current flowing in the bypass conductor.

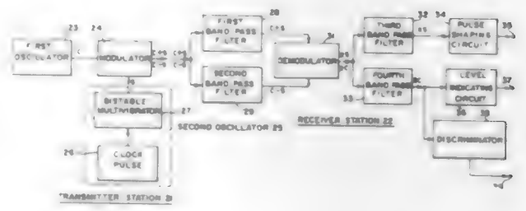
3,372,335
TWO CHANNEL, FREQUENCY DRIFT CORRECTING, REMOTE-CONTROLLED SUPERVISORY SYSTEM

Yuji Takada, Kawasaki-shi, Japan, assignor to Fujitsu Limited, Kawasaki, Japan, a corporation of Japan

Filed Feb. 23, 1965, Ser. No. 434,574

Claims priority, application Japan, Feb. 24, 1964, 39/10,038

6 Claims. (Cl. 325—49)



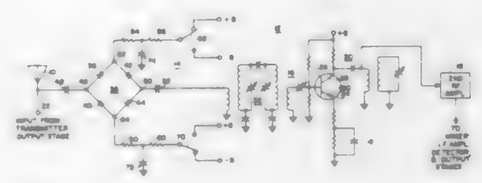
A transmitter station produces a first frequency and a second frequency and adds the first and second frequencies to produce a first supervisory signal comprising the sum component of the first and second frequencies. The transmitter station derives the difference between the first and second frequencies to produce a second supervisory signal comprising the difference component of the first and second frequencies. A receiver station receives the first and second supervisory signals transmitted from the transmitter station and derives the difference between the first and second supervisory signals to produce a first control signal comprising the difference of the first and second supervisory signals. The receiver station adds the first and second supervisory signals to produce a second control signal comprising the sum of the first and second supervisory signals. The first control signal is equal to twice the second frequency and the second control signal is equal to twice the first frequency.

3,372,336
RECEIVER INCLUDING INPUT OVERLOAD PROTECTION CIRCUIT

Raymond E. Bachman and Gabriel J. Luhowy, Rochester, N.Y., assignors to General Dynamics Corporation, a corporation of Delaware

Filed Dec. 16, 1964, Ser. No. 418,671

7 Claims. (Cl. 325—376)



1. A radio receiver input circuit for coupling the receiver to a source of radio signals, said input circuit comprising

(a) an amplifier stage including a current sensitive component,

(b) circuit means including a bridge circuit for coupling said component to said radio signal source,

(c) said bridge circuit including an individual diode in each arm thereof,

(d) means for biasing said diodes in their forward direction including a plurality of resistors respectively connected to said source through said bridge by way of different ones of said arms of said bridge, said different ones of said arms including different ones of said diodes which are polarized in opposite senses, and

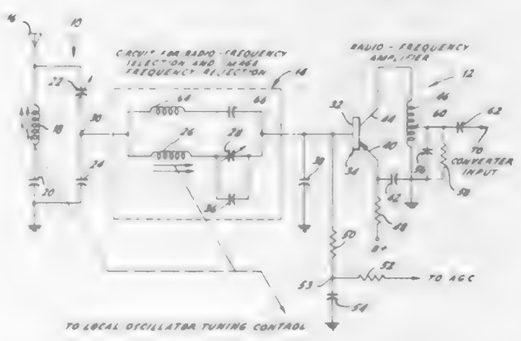
(e) capacitor means connected to said different ones of said diodes for charging whenever the voltage of said source exceeds said biasing voltage.

3,372,337
IMAGE FREQUENCY ATTENUATION CIRCUIT

John F. Beres, Southampton, Pa., assignor to Philco-Ford Corporation, a corporation of Delaware

Filed Apr. 27, 1964, Ser. No. 362,781

19 Claims. (Cl. 325—388)



CIRCUIT FOR RADIO FREQUENCY SELECTION AND IMAGE FREQUENCY REJECTION
RADIO - FREQUENCY AMPLIFIER
TO CONVERTER INPUT
TO AGC
TO LOCAL OSCILLATOR TUNING CONTROL

An image frequency attenuation circuit comprising a tuning branch series-resonant at the frequency of a desired signal and a reactive branch shunted across the tuning branch. The tuning branch and the reactive branch form, in combination, a circuit which is parallel-resonant at approximately the frequency of the signal to be attenuated.

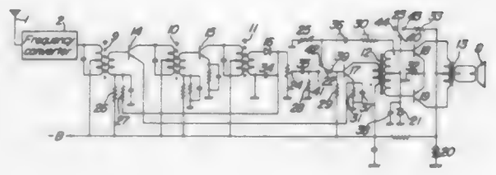
3,372,338
RADIO COMMUNICATION RECEIVER WITH STANDBY CONTROL AND WARNING CIRCUIT

Takashi Kubota, Kamakura-shi, and Seishi Yamazaki, Yokohama, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan

Filed May 26, 1964, Ser. No. 370,240

Claims priority, application Japan, May 28, 1963, 38/26,568, 38/26,569; Oct. 10, 1963, 38/52,795; Oct. 17, 1963, 38/54,845

14 Claims. (Cl. 325—364)



1. In a radio communication apparatus, a receiver circuit comprising a frequency converter, an intermediate-frequency amplifier transistor connected to said frequency converter, means for applying automatic gain-controlling voltage to said intermediate-frequency amplifier transistor, a low-frequency amplifier transistor, a transistor power amplifier connected to said low frequency amplifier transistor, a resistor through which flows the emitter current of said intermedite-frequency amplifier transistor and the emitter current of said low-frequency amplifier transistor concurrently, means for selectively feeding back the output signal of said low-frequency amplifier transistor to the input electrode thereof during the standby period of said receiver circuit and means for selectively interrupting the base bias current of said transistor power amplifier during said period, the collector current of said low-frequency amplifier transistor being increased in response to decrease in the collector current of said intermediate-frequency amplifier transistor upon receipt of any incoming signal for effecting oscillation of said low-frequency amplifier transistor, the output of said oscillation serving to excite said transistor power amplifier to amplify said oscillation output for indicating that signals are being received.

3,372,339
COMMUNICATION SYSTEM INCLUDING FREQUENCY SYNTHESIZER SYSTEM

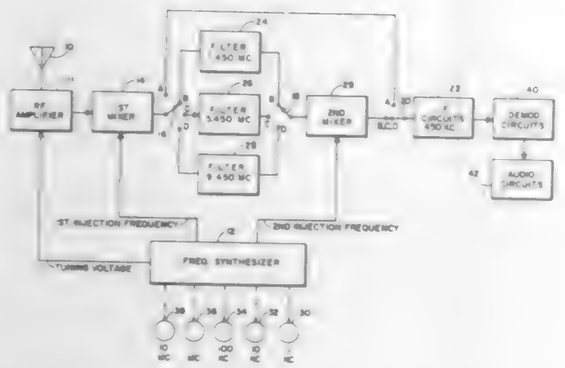
John E. Harrison, Rochester, Floyd A. Koontz, Penfield, and Thomas B. Michaels, Rochester, N.Y., assignors to General Dynamics Corporation, a corporation of Delaware

Filed Aug. 17, 1964, Ser. No. 390,111

12 Claims. (Cl. 325—421)

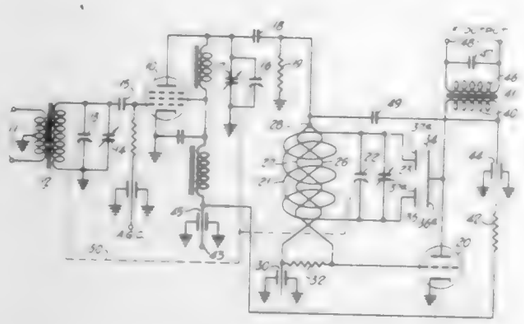
A communication system is described having an RF and IF channel. A frequency synthesizer provides injection signals for translating RF signals into IF signals or vice versa. The synthesizer is controlled in part by a digital frequency counter, the input of which is connected to a reference frequency signal generator and the output of which is connected to a mixer. The counter is controlled by the frequency selection knobs which select the lower order digits of a number which represents the frequency to which the system is to be tuned (100 kc., 10 kc. and 1 kc. digits), such that the mixer receives a frequency having the selected lower order digits. The synthesizer also includes a switched crystal oscillator, the output of which is connected to an error canceling loop which includes the mixer to which the portion of the synthesizer having the digital frequency counter is connected. Other mixers are provided in the error canceling loop in which signals from the reference frequency generator are com-

bined to provide the output injection signal from an output mixer in the error canceling loop. Selectable filters are included in the loop for reversing the direction of error cancellation therein, whereby to double the number of frequencies which are generated. The injections to



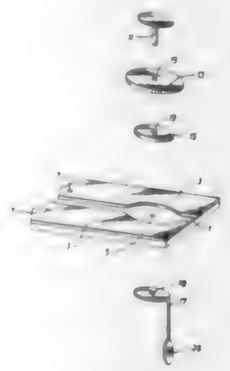
the other mixers in the loop are controlled by the tuning controls of the system so that lower order digits of the frequency of the output injection signal are variable by the lower order digit counter controls independently of any variation in the higher order digit controls.

3,372,340
TRIODE AUTODYNE CIRCUIT
James Edgar Krepps, Bloomington, Ind., assignor to Sarkes Tarzian, Inc., Bloomington, Ind., a corporation of Indiana
Filed Sept. 24, 1964, Ser. No. 398,951
6 Claims. (Cl. 325—440)



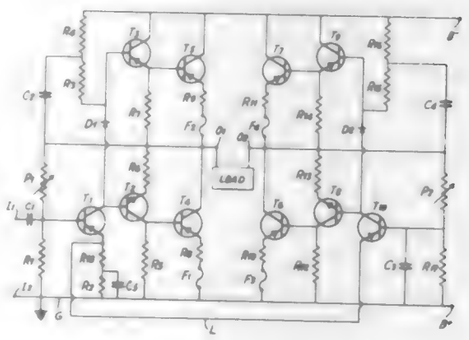
1. An autodyne circuit comprising, a triode tube, an oscillator tank circuit, means including first and second capacitors connected across said tank circuit for coupling the same to the plate of said triode, said capacitors being connected in series across said tank circuit and said plate being connected to the junction of said first and second capacitors, means including a pair of balanced windings inductively coupled to said tank circuit for feeding a signal from said tank circuit to the grid of said triode in the proper phase to sustain oscillations therein, a source of signal input voltage, means connecting said source to said balanced windings at a point of substantially zero oscillator voltage, an intermediate frequency output impedance, a third capacitor, means connecting said output impedance and said third capacitor in series between the plate of said triode and ground, said first, second and third capacitors and said output impedance forming a pi network at the intermediate frequency, said first and second capacitors collectively forming one shunt leg of said pi network, said third capacitor forming the other shunt leg of said pi network and said output impedance forming the series leg of said network, and a neutralizing capacitor connected from the junction of said output impedance and said third capacitor to said point of zero oscillator voltage.

3,372,341
SPARK GAP FOR PROTECTING ELECTRONIC COMPONENTS
Josef Eidecker, Anrath, Germany, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed May 7, 1965, Ser. No. 454,027
Claims priority, application Germany, June 10, 1964, 34,471
4 Claims. (Cl. 328—8)



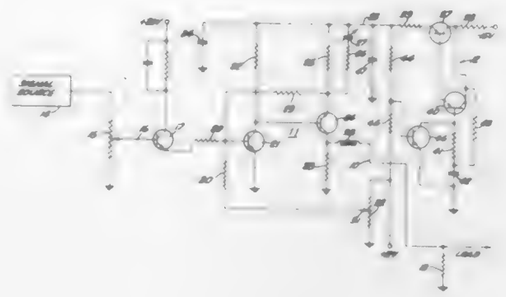
A spark gap apparatus for limiting the electrical potential applied to electronic components. A counter-electrode is precisely spaced from an electrode on a circuit board by an annular spacer. The edge of the counter-electrode extends beyond the spacer and defines a surface which overlies the electrode on the circuit board. Electric discharges will travel between the exposed surface of the counter-electrode and the adjacent surface of the electrode.

3,372,342
DIFFERENTIAL POWER AMPLIFIER
Martin G. Reiffin, 515 Cathedral Parkway, New York, N.Y. 10025
Filed Sept. 26, 1963, Ser. No. 311,732
20 Claims. (Cl. 330—15)



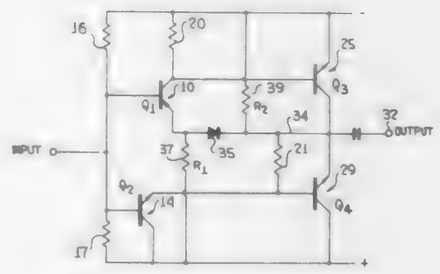
18. A transistor power amplifier comprising a differential amplifier stage having a pair of outputs with respective oppositely-phased output signals, a pair of push-pull complementary-symmetry drive stages each direct-current-coupled to a respective one of said differential amplifier stage outputs, a pair of push-pull output stages each direct-current-coupled to a respective one of said drive stages, and a pair of output terminals for connection to a load and each direct-current-coupled to a respective one of said output stages.

3,372,343
CONSTANT CURRENT GENERATOR SYSTEM
William R. Tompkins, San Diego, Calif., assignor to Cohu Electronics, Inc., San Diego, Calif., a corporation of Delaware
Filed May 4, 1965, Ser. No. 453,117
10 Claims. (Cl. 330—17)



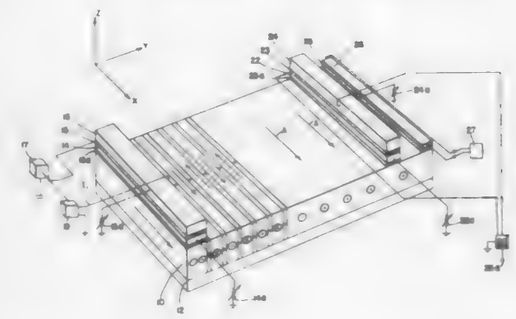
1. An amplifier circuit for driving an electrically long line having a characteristic impedance, comprising: a source of signals, an output circuit, a first transistor, resistive means for applying signals from said source to the base of said first transistor, a source of regulated potential, means for connecting the emitter and the collector of said first transistor in series with said source of potential, a second transistor having complementary symmetry with said first transistor, means for connecting the emitter and the collector of said second transistor in series with said source of potential, means connecting the collector of said first transistor to the base of said second transistor, resistive means connecting the emitter of said second transistor to the base of said first transistor, means coupling the collector of said second transistor to said output circuit, and an impedance connected to the collector of said second transistor and across said output circuit, said impedance having a value equal to said characteristic impedance.

3,372,344
TRANSISTOR AMPLIFIER PROTECTIVE CIRCUIT
David Hafler, 11 Merion Road, Merion Station, Pa. 19066
Filed Oct. 20, 1965, Ser. No. 498,570
5 Claims. (Cl. 330—17)



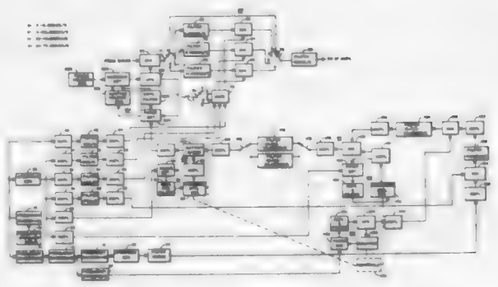
3. A transistor amplifier circuit comprising a driver stage including first and second transistors of opposite conductivity type couples to provide oppositely phased output signals therefrom in response to simultaneous application of input signal thereto; an output stage including first and second transistors coupled to receive respective output signals from said first and second transistors of said driver stage; means connecting the output circuits of the driver stage transistors to a first common junction; means connecting the output circuits of the output stage transistors to a second common junction for deriving output signal therefrom; a negative feedback path connecting said first and second common junctions; and means in said negative feedback path for limiting the flow of feedback current to a predetermined maximum level and for variably biasing said driver stage to maintain signal conduction at low signal levels.

3,372,345
MAGNETIC AMPLIFIER
Harrison W. Fuller, Needham Heights, Mass., assignor to Laboratory for Electronics, Inc., Boston, Mass., a corporation of Delaware
Filed Feb. 19, 1964, Ser. No. 345,974
5 Claims. (Cl. 330—63)



A magnetic amplifier including an anisotropic magnetic thin film having an easy axis of magnetization. A rotating magnetic field applied at one end of the film generates a succession of magnetic domains, alternate ones being magnetized in opposite directions. An electrical signal applied to electrodes at the other end of the film generates a restraining magnetic field thereby slowing down propagation of the magnetized domains along the film. Varying the electrical signal applied to these electrodes, varies the amount of magnetic energy passing along the film and a pick-up transducer sensing the magnetic field from the film converts it into an electrical output signal which varies in proportion to the variable signal applied to the restraining electrodes.

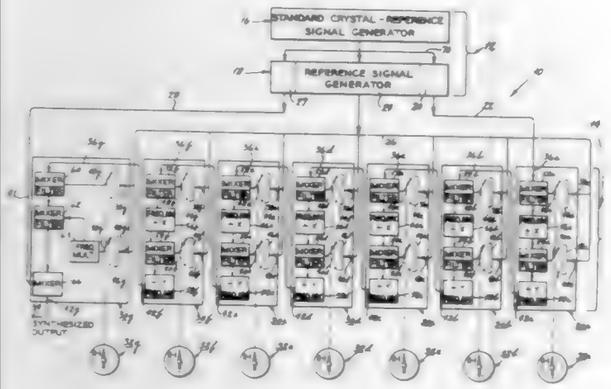
3,372,346
FREQUENCY SYNTHESIZER SYSTEM FOR GENERATING SIGNALS HAVING FREQUENCIES OVER A WIDE BAND OF FREQUENCIES ALL OF WHICH ARE PHASE COHERENT WITH FREQUENCY STANDARD SIGNALS
Raymond J. Rogers, Rochester, N.Y., and Ernest W. Hughes, Ft. Wayne, Ind., assignors to General Dynamics Corporation, a corporation of Delaware
Filed Sept. 9, 1966, Ser. No. 578,338
9 Claims. (Cl. 331—2)



A frequency synthesizer system is described which produces signals over a band from 2–76 mc./s. all coherent with frequency standard signals. The synthesizer includes

two channels which generate signals and apply them to an output mixer. The output mixer drives an output phase locked loop which follows the selected output mixer product. The output phase locked loop produces injection frequency signals for the mixer stages of a radio. Each of the channels includes phase locked loops which are locked by spectrum components obtained from the frequency standard. The input to one of the channels is a frequency stable component obtained from the spectrum which has a frequency of about 17 mc./s. A preset divider phase locked loop, which is locked by a frequency stable signal from the standard, generates signals which may be varied in 1 kc. or smaller steps. The preset divider phase locked loop signal is translated into the 17 mc./s. range and then further translated by the output of the other phase locked loop in the second channel so as to provide an input to the output mixer.

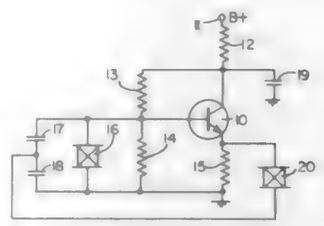
3,372,347
FREQUENCY SYNTHESIZER EMPLOYING MINIMAL NUMBER OF DRIVING FREQUENCIES
Earle D. Jones, Portola Valley, and Albert Macovski, Palo Alto, Calif., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
Filed Apr. 29, 1966, Ser. No. 546,457
11 Claims. (Cl. 331—39)



A frequency synthesizer having modular-type digit selector units consisting of two mixers and two dividers connected in series, the mixers being separated by one divider and the other divider serving as the selector unit output stage. Each mixer has one of its inputs connected through a switch to one of four auxiliary reference signals. In the decade embodiment of the frequency synthesizer one of the dividers provides division-by-two and the other provides division-by-five. In this arrangement only four auxiliary reference signals are required for mixing with a basic reference signal to provide a synthesized signal frequency the lowest digit of which may be one of ten unique digits. The particular synthesized digit results from the particular combination of auxiliary inputs selected by the digit selector unit and applied to the mixer input terminals.

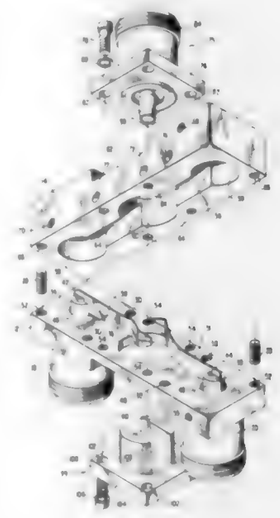
3,372,348
OSCILLATOR HAVING PIEZOELECTRIC ELEMENTS OPERATING AT DIFFERENT HARMONIC MODES
James H. Feit, Chicago, Ill., assignor to Motorola, Inc., Franklin Park, Ill., a corporation of Illinois
Filed May 2, 1966, Ser. No. 546,683
4 Claims. (Cl. 331—116)

Crystal oscillator circuit including two piezoelectric resonators having different natural resonant frequencies and operating at different overtone modes to respond at the same frequency. One resonator is connected in the frequency determining portion of the oscillator and the second resonator is connected in the feedback path for



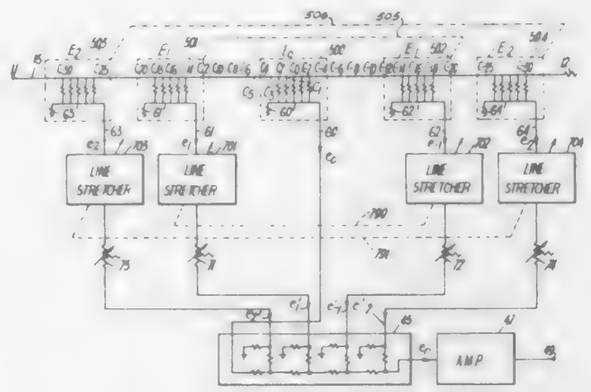
the oscillator. The oscillator includes a transistor and the feedback is from either the emitter electrode or the collector electrode to the base electrode.

3,372,349
MODULAR COAXIAL SWITCH
Carl W. Concelman, Danbury, Conn., assignor to Amphenol Corporation, Broadview, Ill., a corporation of Delaware
Filed Aug. 13, 1965, Ser. No. 479,458
13 Claims. (Cl. 333—7)



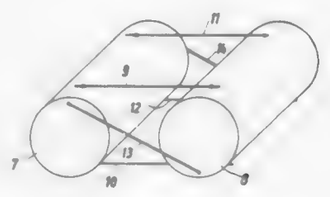
1. An electrical switch for high frequency circuits comprising an elongated switch housing having a longitudinally extending internal chamber and having upper and lower faces each provided with a recess in a central portion thereof, said housing being provided with a first pair of apertures extending inwardly from the bases of said recesses into communication with said chamber and also being provided with a pair of additional apertures extending inwardly from one of said faces into communication with end portions of said chamber, first and second connector fittings extending respectively through said additional apertures and being secured to said housing, each of said connector fittings having an outer end portion adapted for coupling to a transmission line and an inner end portion including a conductor extending into said chamber and being insulated from said housing, first and second switch blades connected respectively to said conductors of said connector fittings and extending longitudinally along said chamber in spaced relation to the walls of said chamber, the free end portions of said switch blades remote from said conductors being disposed in the zone where said first pair of apertures communicate with said chamber, a connector module including a base portion adapted to be received in either of said recesses, said connector module having an outer end portion adapted for coupling to a transmission line and an inner end portion including a contact element disposed between the free end portions of said switch blades in said chamber, and means connected to said housing for moving said switch blades, whereby either of said switch blades may be disposed in contact with said contact element.

3,372,350
ARRANGEMENT FOR COMPENSATING AMPLITUDE AND PHASE DISTORTION OF AN ELECTRIC SIGNAL
Takeshi Kawahashi and Haruo Shiki, Tokyo, Japan, assignors to Nippon Electric Company, Limited, Tokyo, Japan, a corporation of Japan
Filed Sept. 17, 1963, Ser. No. 309,512
Claims priority, application Japan, Sept. 17, 1962, 37/40,297
19 Claims. (Cl. 333—28)



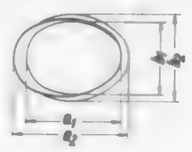
1. A directional coupler employed in systems which compensate for distortion of an electrical signal wave comprising:
first and second transmission lines having characteristic impedances Z_0 and mZ_0;
said second transmission line being of a predetermined length;
said first transmission line being at least as long as said second transmission line;
first and second terminating impedances Z_0 and mZ_0 each being respectively connected to one end terminal of said first and second transmission lines;
the remaining end terminal of said first transmission line receiving said electrical signal wave;
the remaining end terminal of said second transmission line providing the desired output signal;
a plurality of non-inductive resistors coupling said first and second transmission lines;
each of said resistors having their end terminals connected to said first and second transmission lines;
the points of connection along said first and second transmission lines being arranged at equally spaced intervals so as to space said resistors apart by a distance $\frac{1}{4}n$ wavelength of the substantial center frequency of said electrical signal wave interconnecting said first and second transmission lines.

3,372,351
MECHANICALLY STRONG MECHANICAL RESONANT FILTER HAVING WEAK COUPLING BETWEEN RESONATORS
Manfred Börner, Ulm (Danube), and Hans Schüssler, Beimerstetten, Germany, assignors to Telefunken Patentverwertungs-G.m.b.H., Ulm (Danube), Germany
Filed Jan. 20, 1964, Ser. No. 338,724
Claims priority, application Germany, Jan. 18, 1963, T 23,355
15 Claims. (Cl. 333—71)



1. A mechanical resonant filter device having a small relative bandwidth comprising, in combination:
at least two mechanical resonant bodies; and
homogeneous coupling line means for directly connecting said resonant bodies, said coupling means including at least two coupling lines connected for coupling oscillations which are only approximately 180° phase-shifted with respect to each other in the pass wave range for reducing the coupling factor, said coupling lines having an acoustical length of $(2n+1)\lambda/4$, where λ=wavelength at the center frequency of the coupling line and n is equal to an integer.

3,372,352
WAVEGUIDE
Wolfgang Krank, Backnang, Wurttemberg, and Günter Möhring, Langenhagen, Hannover, Germany, assignors to Telefunken Patentverwertungs-G.m.b.H., Ulm (Danube), and Hackethal-Draht und Kabel-Werke A.G., Hannover, Germany
Continuation of application Ser. No. 395,532, Sept. 10, 1964. This application July 24, 1967, Ser. No. 655,672
3 Claims. (Cl. 333—95)

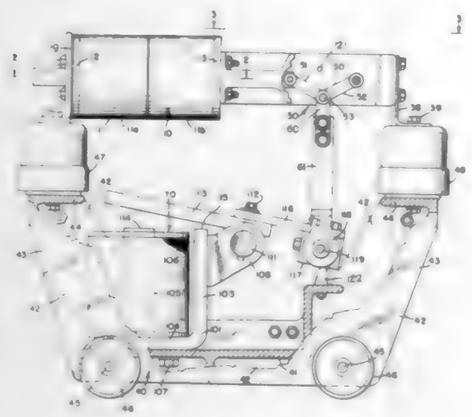


A waveguide having optimum dimensions and in the form of a flexible hollow conductor for the wideband transmission of linearly polarized electromagnetic waves, the waveguide being in the form of a corrugated metal tube of oval cross section and being dimensioned so that a certain relationship exists between the maximum and minimum dimensions of its major and minor axes, the shape and dimensions of the corrugations, the spacing between two successive corrugation ridges and the corrugation pitch angle.

3,372,353
TOGGLE OPERATED ELECTRIC VACUUM SWITCH
Merlin R. Jensen, Minneapolis, Minn., assignor to Electric Machinery Mfg. Company, Minneapolis, Minn., a corporation of Minnesota
Filed Oct. 20, 1966, Ser. No. 588,104
4 Claims. (Cl. 335—26)

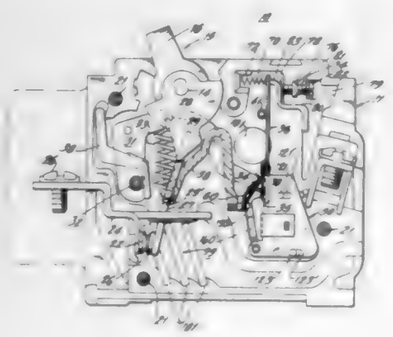
A vacuum electric switch operated by an electromagnet

by means of toggle mechanism and including resilient



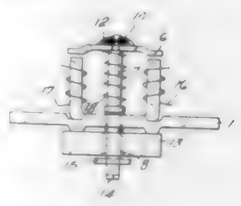
means concentric with one of the contacts for holding the contact in either closed or open position.

3,372,354
ADJUSTABLE MAGNETIC TRIP CIRCUIT BREAKER
Felix E. Myers, Haddon Heights, N.J., assignor to I-T-E Circuit Breaker Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Oct. 7, 1966, Ser. No. 585,162
9 Claims. (Cl. 335—176)



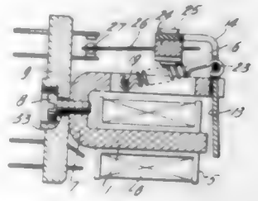
1. In a circuit breaker comprising:
a stationary contact, a cooperating movable contact, and an operating mechanism for moving said movable contact between contact engaged and contact disengaged conditions with said stationary contact;
said operating mechanism including a latchable member, and a latch means operatively positionable in latching engagement therewith for maintaining said latchable member in a first position;
means for urging said latchable member towards a second position;
said contacts being in said engaged condition corresponding to said latch means maintaining said latchable member in said first position;
said contacts being tripped to said disengaged condition responsive to release of said latching engagement and movement of said latchable member towards said second position;
an electromagnetic trip means for releasing said latching engagement responsive to predetermined circuit conditions;
said electromagnetic trip means including cooperating magnet and armature means;
said armature means normally air gap separated from the pole faces of said magnet means and operatively mounted for movement towards said pole faces to close said air gap;
tripping means moved by said armature means responsive to movement of said armature means towards said pole faces for striking a trip portion of said latch means and causing release of said latching engagement;
means for adjusting the normal air gap separation between said armature means and magnet pole faces, whereby the electromagnetic energization required for moving said armature towards said pole faces is adjustably varied;
said adjustment means including means for simultaneously controlling the trip spacing between said armature tripping means and latch means trip portion, whereby said trip spacing is controlled corresponding to a range of armature air gap adjustments.

3,372,355
SOLENOID ARRANGEMENT
Horst Zielasko, Nordenham-Einswarden, Germany, assignor to Felten & Guilleaume Carlswerk Aktiengesellschaft, Cologne-Mulheim, Germany
Filed July 11, 1966, Ser. No. 564,282
Claims priority, application Germany, July 20, 1965, F 46,657
10 Claims. (Cl. 335—230)



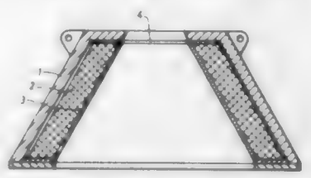
1. A polarized magnetic arrangement comprising, in combination, an electromagnetic solenoid unit composed of a base, two spaced pole pieces integral at one end thereof with said base and having free ends and secondary pole portions on said base integral therewith and arranged spaced from each other; a permanent magnet mounted on said electromagnetic solenoid unit in permanent contact with said spaced secondary pole pieces; an armature having portions located in the region of said free ends of said spaced pole pieces; and means mounting said armature movable towards and away from said free ends.

3,372,356
COMPACT RELAY WITH SINGLE YOKE-CORE MEMBER
Masao Hiyane and Yukihiro Suizu, Suzaka-shi, Japan, assignors to Fujitsu Limited, Kawasaki, Japan, a corporation of Japan
Filed Jan. 18, 1966, Ser. No. 521,313
6 Claims. (Cl. 335—281)



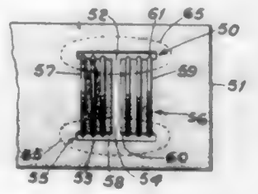
A relay comprises a yoke-core member of unitary structure and substantially U-shaped configuration having a first core arm, a second yoke arm spaced from and substantially parallel to the first core arm and a center part joining the first and second arms. The first and second arms have substantially coplanar end surfaces. The second yoke arm has an elongated slot formed therethrough. The yoke-core member is of magnetizable material and supports an energizing coil on its first core arm. An armature member of substantially L-shaped configuration is pivotally mounted in operative proximity with the first core arm on the second yoke arm at the end surface thereof. A release spring positioned in the elongated slot formed through the second yoke arm has one end affixed to a first fastener in the slot and another end affixed to a second fastener in the armature.

3,372,357
ELECTROMAGNET FOR LIFTING LARGE LOADS OF FINE-GRAINED FERROMAGNETIC SUBSTANCES
Karl Dietzel, Krefeld-Urdingen, and Ulrich Veiel, Krefeld-Bockum, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany
Filed Feb. 23, 1966, Ser. No. 529,385
Claims priority, application Germany, Feb. 25, 1965, F 45,357
6 Claims. (Cl. 335—291)



Electromagnet without an iron core for lifting heavy loads of fine-grained ferromagnetic substances, including a solenoid composed of a spool having its winding in the form of a hollow cone expanding or diverging in the direction of the material to be lifted thereby, such that the magnetic field strength thereof increases along the axis of rotation of said core towards that end which is remote from the material to be lifted.

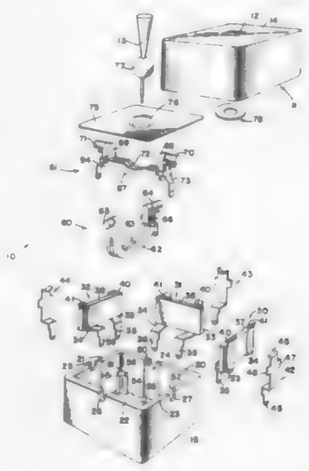
3,372,358
FILM TRANSFORMERS
James W. Roy, Morristown, and Andre Sunnen, Montclair, N.J., assignors to International Telephone and Telegraph Corporation, Nutley, N.J., a corporation of Maryland
Filed Apr. 12, 1966, Ser. No. 542,046
4 Claims. (Cl. 336—200)



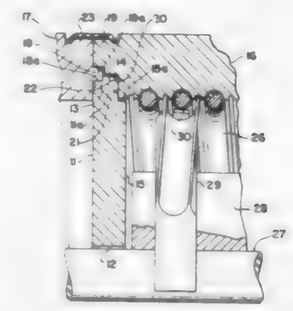
This is an invention of a transformer having primary and secondary windings composed of conductive film disposed on a substrate having magnetic permeability properties.

3,372,359
COORDINATED CONTROL FOR VARIABLE RESISTORS
Gordon K. Wilson, Lake Forest, Ill., assignor to Carter Precision Electric Company, Skokie, Ill., a corporation of Illinois
Filed Jan. 30, 1967, Ser. No. 612,499
9 Claims. (Cl. 338—128)

A coordinated control for a plurality of variable resistors having movable U-shaped carriers mounted at right angles in a housing, each of which mounts or carries at least one conducting wiper for simultaneous engagement with a resistor and stationary terminal to provide a conducting path. A single joy stick-type control lever is carried by a ball-and-socket joint intermediate its ends for nutating (i.e. joy stick) movement and has one end slidably engaging elongated slots in each of the carriers thereby to obtain coordinated control and adjustment of the wipers and associated resistors when the free end of the control lever is moved. Several variable resistors may be positioned for coordinated control with suitable modification of the slide or wiper positioned on the carriers.



3,372,360
COMPOSITE HOUSING FOR ELECTRICAL DEVICES
Lloyd E. Hall, Fullerton, Calif., assignor to Beckman Instruments, Inc., a corporation of California
Filed Feb. 28, 1967, Ser. No. 619,373
4 Claims. (Cl. 338—143)

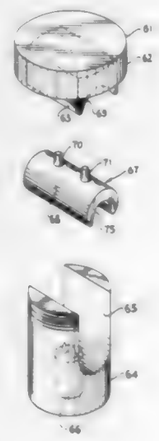


A composite housing for electrical components formed of at least two casing members adapted to be assembled in end-to-end relationship with a separator wall supported therebetween separating the respective spaces in said casing members.

3,372,361
CABLE CONNECTOR
Henry R. Wengen, Poughkeepsie, N.Y., assignor to Fargo Mfg. Company, Inc., Poughkeepsie, N.Y., a corporation of New York
Filed June 15, 1965, Ser. No. 464,020
1 Claim. (Cl. 339—97)

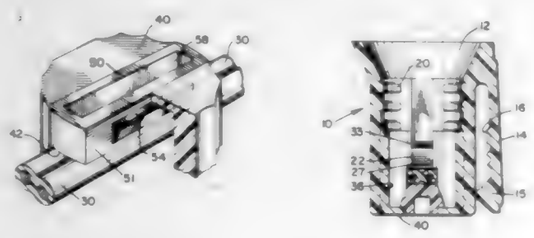
1. A connector for a cable having a plurality of strands of substantially equal diameter and a surrounding insulation including in combination a non-conducting cylindrical body, a transverse groove formed in said body at

one end thereof, a threaded portion of said body, a non-conducting cover, a threaded section of said cover engageable with said threaded portion, a non-conducting pressure pad pivotally attached to said cover and dimensionally formed to be received within said groove, said pad having a first arcuate surface of relatively large dimension, an adaptor adjacent said pressure pad nd formed to be embraced by said arcuate surface, a second arcuate surface of said adaptor having a dimension less than the dimension of said first arcuate surface, a contact member supported by said body and formed of a conducting material, an exposed threaded well of said contact member, a plurality of electrically conducting piercing points formed on said contact member and which



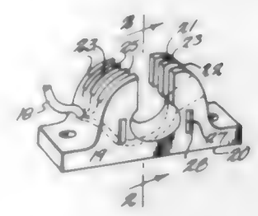
project within said groove, each of said piercing points being in length sufficient to pass between two layers of strands of said plurality and said insulation and each of said piercing points having a contoured point with its apex away from said body and a base adjacent said body and being spaced from adjacent piercing points a distance greater than the diameter of one of said strands of said plurality allowing a straddling of said strands, whereby upon said threaded portion and said threaded section being engaged and said cover and said body drawn together said adaptor is forced against said cable and said piercing points are forced through said insulation and between strands, and means to maintain said adaptor in position on said pressure pad while the cable is being pierced.

3,372,362
LAMP SOCKET AND CLIP
Henry Schick, Commack, N.Y., assignor to Gilbert Manufacturing Co., Inc., Long Island City, N.Y., a corporation of New York
Filed Oct. 6, 1965, Ser. No. 493,472
10 Claims. (Cl. 339—99)



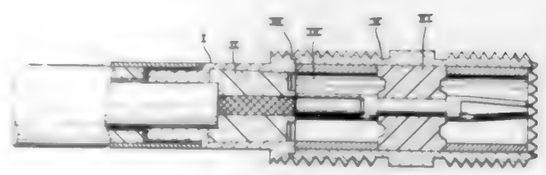
A socket for receiving a light bulb having an opening in the bottom wall for receiving a pair of current carrying wires, the socket having a cover piece with arms mounted on deformable side walls which arms engage the socket bottom wall to hold the cover piece thereto.

3,372,363
LIGHT BULB CONSTRUCTION
Roberto L. Bustamante, 4a. C.P. #40, Santa Ana, El Salvador
Filed Oct. 5, 1964, Ser. No. 401,619
9 Claims. (Cl. 339—145)



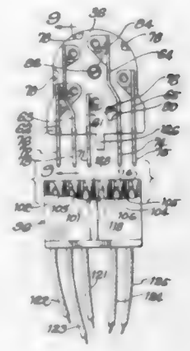
The socket assembly comprises a body made of electrical insulating material with a cylindrical aperture passing therethrough from end face to end face. The sockets also have a first slot extending outwardly from the cylindrical aperture and from end face to end face for receiving contact tines on electrical energy dissipating devices which are inserted in the socket. One or more lateral slots, provided with electrically conductive contacts for engaging tines of the electrical energy dissipating devices, extend from the first slot and are located intermediate the end faces of the socket. In addition, a pair of spaced-apart apertures with contacts mounted therein are located on one end face of the socket on either side of the cylindrical aperture. Electrical energy dissipating devices such as plugs and bulb assemblies are also provided. These devices are provided with radially and longitudinally extending tines which are adapted to be received in the lateral slots and the pair of slots, respectively.

3,372,364
COAXIAL CONNECTOR
Michael Francis O'Keefe, Mechanicsburg, and John Changnien Fan, New Cumberland, Pa., assignors to AMP Incorporated, Harrisburg, Pa.
Filed Sept. 10, 1965, Ser. No. 486,360
12 Claims. (Cl. 339—177)



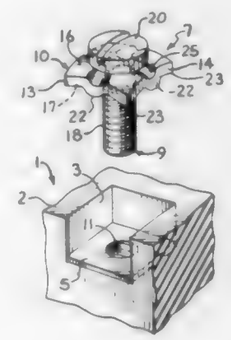
A coaxial connector device is disclosed including a double-ended receptacle and a mating plug structure. The plug structure includes a conductive shell having a smooth bore with a slight taper carrying a dielectric insert compressively loaded against axial pullout by the slight taper to axially lock a center contact member therein. The contact member has a substantially constant outer diameter but includes a series of slight serrations engaged by the dielectric material of the insert in compression. The receptacle carries in the center thereof a dielectric insert carrying a center contact member locked against axial displacement by thin wedge fitted rings within the shell on either side of the insert. The mating portions of the receptacle and plug are held of a substantially constant diameter.

3,372,365
TERMINAL CONSTRUCTION FOR ELECTRICAL SWITCHES OR THE LIKE
Michael F. Bedocs, Wilmette, Ill., assignor to Indak Manufacturing Corp., Northbrook, Ill., a corporation of Illinois
Filed Dec. 23, 1965, Ser. No. 515,890
4 Claims. (Cl. 339—186)



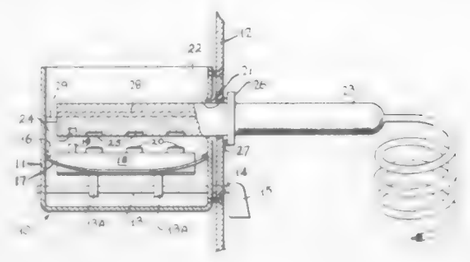
An insulating member, a plurality of terminal prongs projecting beyond said member, a connector having receptacle openings for receiving said prongs, said openings having receptacle contacts therein for engaging said prongs, said connector having an extra receptacle opening therein, and a locating peg on said insulating member and receivable in said extra opening when said connector is properly oriented, each of said receptacle openings having a main portion for receiving one of the prongs and a narrower side portion for receiving the receptacle contact, said peg being receivable in the narrower side portion of the extra opening.

3,372,366
FASTENING DEVICE
William A. Cochrum, Bloomingdale, Ill., assignor to The Fastron Co., Franklin Park, Ill., a corporation of Illinois
Continuation of application Ser. No. 397,952, Sept. 21, 1964. This application Oct. 24, 1966, Ser. No. 589,133
8 Claims. (Cl. 339—272)



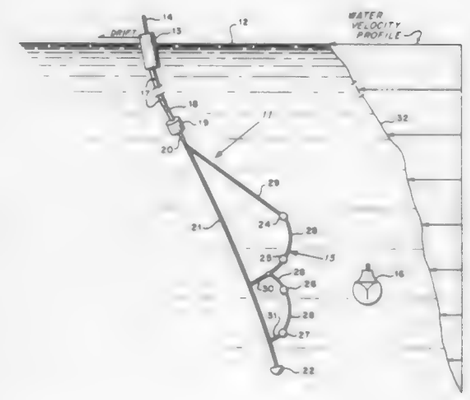
A fastener including a washer for securing a wire to an electrical terminal having a threaded recess. The washer having a body with a generally concave surface on one face and a generally convex surface on the opposite face. The body of the washer having an axial hole therethrough to receive a screw for threading into the recess to hold the wire between the concave surface of the washer and the terminal. The concave surface of the washer having rib means to grip the wire. The rib means being tapered to cam the wire towards the screw.

3,372,367
ELECTRICAL CONNECTION APPARATUS
Virgil K. Concannon, Mount Arlington, N.J. (285 Mount Arlington Blvd., Landing, N.J. 07850)
Filed Aug. 30, 1966, Ser. No. 576,522
3 Claims. (Cl. 339—274)



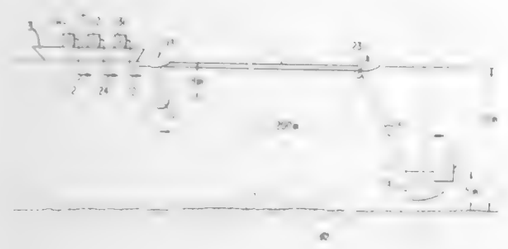
1. Electrical connection apparatus comprising,
a connector receptacle having a support member and an apertured front panel, a cam shaft having cam means and extending through said member and panel, a snap acting spring having its ends secured to said member, a connector plate having protruding contact means and guide means and being normally biased by said spring toward said cam shaft,
a cable connector plug having recessed contact means and means for receiving said guide means, stop means on said plug for engaging said panel upon said plug having traversed its aperture a predetermined distance such that said recessed contact means and guide receiving means correspondingly overlie said protruding contact means and guide means, in vertical alignment, and
means on said cam shaft forwardly of said panel for actuating said cam means to elevate said plate and interengage said aligned means.

3,372,368
VERTICAL STABILIZATION OF LINE HYDROPHONE ARRAYS
John R. Dale, Willow Grove, and Harry R. Menzel, Hatboro, Pa., assignors to the United States of America as represented by the Secretary of the Navy
Filed May 31, 1966, Ser. No. 554,939
11 Claims. (Cl. 340—2)



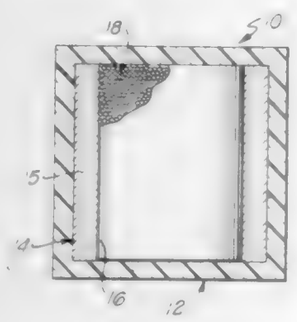
A plurality of hydrophones or the like are maintained in a substantially vertical line array over a large range of water velocity profiles by a truss arrangement having members of preselected lengths. The truss also isolates the array from cable vibrations caused by fluid drag forces and thus substantially reduces cable strumming.

3,372,369
ACOUSTIC METHOD FOR MAPPING UNDERWATER TERRAIN EMPLOYING LOW FREQUENCY CONTINUOUS ACOUSTIC WAVES AND FIXEDLY SEPARATED TRANSDUCERS
Andre Cecchini, Montrouge, Michel Hanff, Brest, and Pierre Juhel, Soyaux, France, assignors to Compagnie des Compteurs, Paris, France, a corporation of France
Filed Sept. 20, 1965, Ser. No. 488,468
14 Claims. (Cl. 340—7)



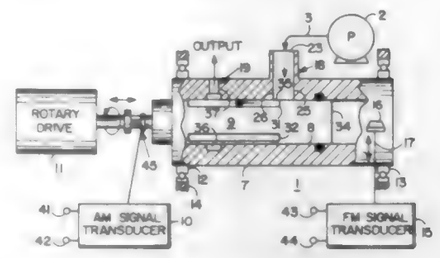
An acoustic method for prospecting the surface of the sea bed which consists in producing low frequency continuous acoustic waves at a first point below the water above the bed. The acoustic waves are received continuously at at least one second point lying below the surface of the water above the bed at a predetermined constant distance above the bed and at a predetermined constant distance from the first point. The received acoustic waves are continuously recorded and measured and the continuation of the signal employed to define data relating to the nature of the sea bed.

3,372,370
ELECTROACOUSTIC TRANSDUCER
Reginald J. Cyr, Woodland Hills, Calif., assignor to Aquasonics Engineering Company, Inc., Canoga Park, Calif., a corporation of California
Filed Sept. 22, 1965, Ser. No. 489,342
6 Claims. (Cl. 340—8)



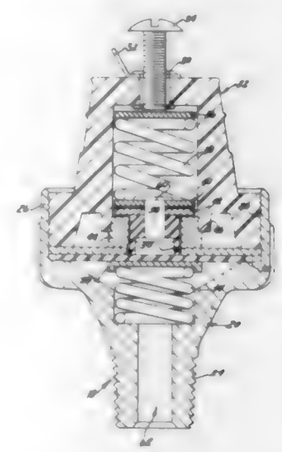
1. In an electroacoustic transducer adapted for underwater applications, the combination of: a piezoelectric transducing element; means including a pressure-accommodating mass of acoustic energy absorbing material disposed in operative relationship with said transducing element for supporting said element against destructive deformation from the pressure of surrounding water while permitting the vibratory functioning of said element, said mass consisting of a plurality of inorganic microballoons supported in closely juxtaposed operative relationship with each other by a suspensory body with the assembly thereof disposed in operative supporting relationship with said piezoelectric transducing element; and a housing encompassing said transducing element and said pressure-accommodating mass.

3,372,371
AM/FM HYDROACOUSTIC GENERATOR
Marshall W. Lesser and Joseph F. McCormick, Monroe, N.Y., assignors to General Dynamics Corporation, a corporation of Delaware
Filed May 13, 1966, Ser. No. 549,871
5 Claims. (Cl. 340—8)



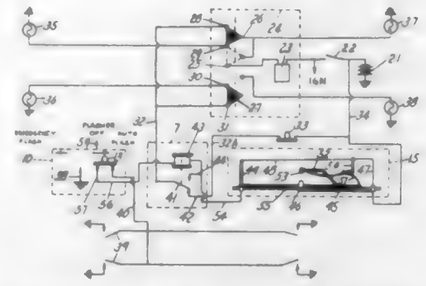
An AM/FM hydroacoustic oscillator is described comprising a housing having inlet and outlet ports through which fluid (under pressure) flows, and a spool disposed in the housing having a channel cut therein, the spool being adapted for rotation and translation movement with respect to its axis so that when the spool is translated the flow area through the oscillator is varied to produce amplitude oscillation of the fluid flow. FM oscillation is accomplished by cyclically rotating the housing in relation to the spool.

3,372,372
AUTOMOBILE DECELERATION SIGNAL SWITCHING CIRCUIT
William R. Carpenter, Muskegon, and David G. Passmore, Comstock Park, Mich., assignors, by mesne assignments, to Medallion Instruments, Inc., Spring Lake, Mich., a corporation of Michigan
Filed Mar. 31, 1965, Ser. No. 444,266
7 Claims. (Cl. 340—71)



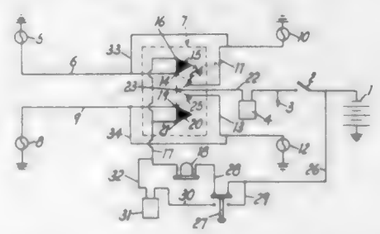
A circuit for switching on an incandescent alarm lamp in response to deceleration of a motor vehicle, in which a relatively high-impedance branch of the circuit constantly maintains a very low current through the lamp sufficient only to warm its filaments but insufficient to drive the same into incandescence, and wherein a switch means senses the engine vacuum and upon deceleration conditions closes a shorting circuit across the aforesaid high impedance branch to raise the current flow through the indicating lamp and cause incandescence thereof. The vacuum-sensing switch means incorporates a diaphragm-operated contact, a relatively fixed contact, and a floating contact positioned therebetween which is attached to neither and which can move between them to keep such contacts clean and unpitted.

3,372,373
AUTOMOBILE DOOR OPERATED SAFETY SIGNAL
William A. Heidman, Jr., 1139 Lakeside Drive SE., Grand Rapids, Mich. 49506
Filed Sept. 11, 1964, Ser. No. 395,679
13 Claims. (Cl. 340—74)



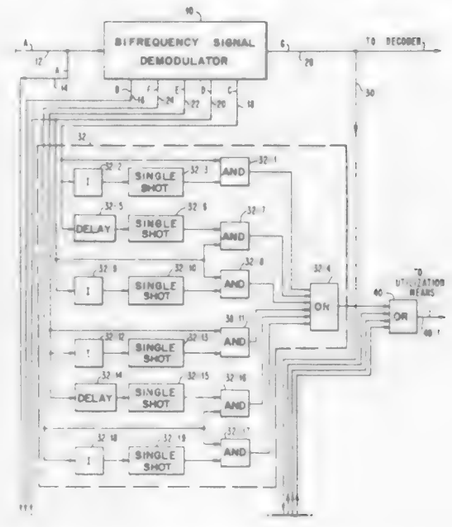
1. In an automotive vehicle having two exterior rear lights with one on each side of the vehicle, a battery, a first normal rear light energizing circuit including individual conductors connected separately to said two rear lights, and a selectively operable switch adapted to connect said rear light circuit including both said individual conductors through said battery,
an emergency signal system comprising a thermally actuated switch adapted to alternatively and intermittently pass a relatively small and a relatively high amperage current,
said small current being insufficient to effectively light said rear lights,
a relay switch having a coil connected in series with said thermally actuated switch and adapted to be actuated by either said low or high amperage currents,
emergency circuit means including a switch closed by the energized condition of said coil connecting said rear light circuit to said battery through said thermally actuated switch, independently of said selectively operable switch,
another switch closed by the deenergized condition of said coil connecting said rear light energizing circuit to said battery through said selectively operable switch,
and a second selectively operable switch arranged to connect said coil and thermally actuated switch in series through said battery to permit selective energization of said coil.

3,372,374
AUTOMOTIVE STOP LIGHT AND TURN SIGNAL CIRCUITS
William A. Heidman, Jr., 1139 Lakeside Drive SE., Grand Rapids, Mich. 49506
Filed Dec. 28, 1964, Ser. No. 421,267
7 Claims. (Cl. 340—81)



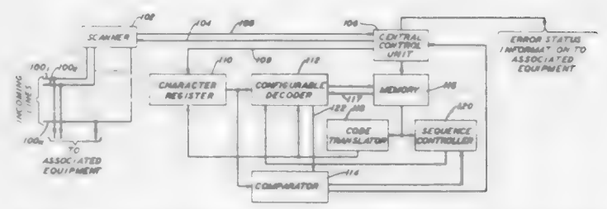
Stop light and turn signal circuits for vehicles in which a manually operable switch is connected to alternatively disconnect the brake switch from the stop lights and connect a second emergency flasher to the stop lights. A variation includes door operated switches in circuit with the emergency flasher.

3,372,375
ERROR DETECTION SYSTEM
Donald J. Lem, Peekskill, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed May 5, 1964, Ser. No. 365,028
11 Claims. (Cl. 340—146.1)



An error checking device for a bi-frequency data signal analyzes the signal as it is decoded to detect erroneous data reception. The factors checked are (1) signal distortion as evidenced by a too short time interval between any two crossings of the zero amplitude reference by the received signal, (2) amplitude distortion which reduces the received signal below a safe level, (3) phase distortion caused by noise and putting a reconstituted signal out of phase with the transmitted signal and (4) decoder clock amplitude which should be at least up to a safe amplitude.

3,372,376
ERROR CONTROL APPARATUS
Harry A. Helm, Morristown, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Oct. 5, 1964, Ser. No. 401,408
14 Claims. (Cl. 340—146.1)



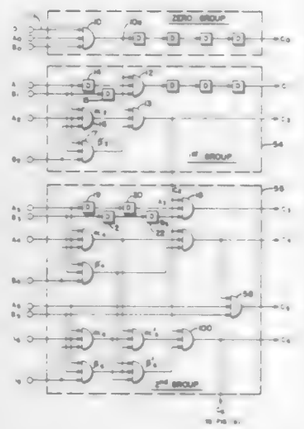
A coding and error control apparatus is incorporated as common equipment in a transmission network containing a plurality of data lines, each of which transmits redundant information signals in accordance with a given error control format. The configuration and state of the apparatus are selectively variable in response to stored control words descriptive of the various error formats associated with the lines. Thus, for example, if information is received on a given line, gating signals derived from the control word associated with that line are applied to configure the apparatus so that decoding of the redundant information may be accomplished in accordance with the error format characteristic of that line. Similarly, the apparatus can be utilized in a multiline system to encode information in accordance with a selected error format associated with a given transmission channel.

3,372,377
DATA PROCESSING SYSTEM

Marius Cohn and Richard Lindaman, Minneapolis, Minn., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

Continuation-in-part of application Ser. No. 442,448, Mar. 24, 1965. This application Aug. 2, 1965, Ser. No. 476,458

15 Claims. (Cl. 340—146.2)



1. A carry generator, for generating n signals $C_{n-1} \ldots C_1 \ldots C_1C_o$, representative of carries corresponding to an augend of the form $A_{n-1} \ldots A_1 \ldots A_1A_o$ and an addend of the form $B_{n-1} \ldots B_1 \ldots B_1B_o$, comprising:

N carry generating groups $N_1=0 \ldots N-1$, where N is defined by the relation $2^{N-1} \leqq n < 2^N$, for generating signal representations of $C_{n-1} \ldots C_1 \ldots C_1C_o$, each of said carry generating groups $N_1=0 \ldots N-2$, coupled to the next lower carry generating group, for generating 2^{N_1} signals representative of

$$C_{2(2^{N_1}-1)} \ldots C_{2^{N_1}-1}$$

corresponding to digit orders

$$A_{2(2^{N_1}-1)} \ldots A_{2^{N_1}-1}$$

of said augend and digit orders

$$B_{2(2^{N_1}-1)} \ldots B_{2^{N_1}-1}$$

of said addend, comprising;

input means for receiving signal representations of digit orders

$$A_{2(2^{N_1}-1)} \ldots A_{2^{N_1}-1}, \; B_{2(2^{N_1}-1)} \ldots B_{2^{N_1}-1}$$

and carry signal

$$C_{2^{N_1}-2}$$

the latter being representative of the highest digit order carry generated by the next lower carry generating group, and

means coupled to said input means for utilizing said digit order and carry signals to generate signals representative of

$$C_{2^{N_1+1}-3} \ldots C_{2^{N_1}-1}$$

and to generate a signal representative of

$$C_{2(2^{N_1}-1)}$$

in accordance with the function,

$$C_{2(2^{N_1}-1)} = \alpha_{2(2^{N_1}-1)}^{N_1} \# \beta_{2(2^{N_1}-1)}^{N_1} \# C_{2^{N_1}-2}^{N_1}$$

said carry generating group $N_1=N-1$, coupled to the next lower carry generating group, for generating

$$n-\sum_{N_1=0}^{N-2} 2^{N_1}$$

signals representative of carries $C_{n-1} \ldots C_{2N-1-1}$ corresponding to digit orders $A_{n-1} \ldots A_{2N-1-1}$ of said augend and digit orders $B_{n-1} \ldots B_{2N-1-1}$ of said addend, comprising;

input means for receiving signal representations of digit orders $A_{n-1} \ldots A_{2N-1-1}$, $B_{n-1} \ldots B_{2N-1-1}$, and carry signal C_{2N-1-1}, the latter being representative of the highest digit order carry generated by the next lower carry generating group, and

means coupled to said input means for utilizing said digit order and carry signals to generate signals representative of $C_{n-2} \ldots C_{2N-1-1}$ and to generate a signal representative of C_{n-1} in no more than N logic levels if $n-1<2^N-2$ and in accordance with the function,

$$C_{n-1} = \alpha_{2^N-2}^{N-1} \# \beta_{2^N-2}^{N-1} \# C_{2^{N-1}-2}$$

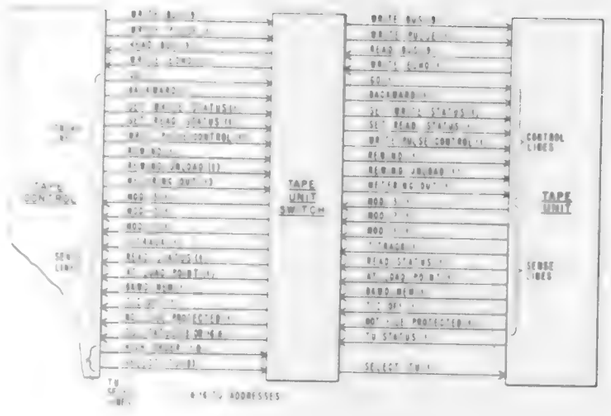
if $n-1=2^N-2$.

3,372,378
INPUT/OUTPUT UNIT SWITCH

Ernest W. Devore, Poughkeepsie, Roy J. Smith, Wappingers Falls, and John M. Tyrrell, Hyde Park, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Apr. 27, 1964, Ser. No. 362,710

21 Claims. (Cl. 340—172.5)



An input/output (I/O) unit switch operated by a plurality of control units, permitting them to independently select and use any available I/O unit from a plurality of I/O units. No additional computer instruction is needed to recognize the existence of the I/O unit switch, which is a passive device that responds to standard I/O select instructions needed without the I/O switch. Coordinating selection circuitry prevents improper selection of any I/O unit. A modular configuration with nodes having slow speed (relay) bus switching circuits and high speed (semiconductor) control circuits permits full performance in switching and controlling magnetic tape units. The control units may be connected to the same or different computer systems.

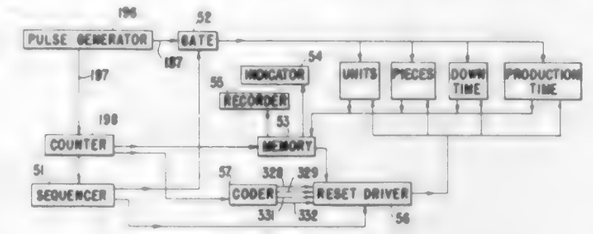
3,372,379
SYSTEM FOR READING, RECORDING AND RESETTING REGISTERED DATA

Donald J. Collom, Birmingham, and Charles G. Mann, Farmington, Mich., assignors to Weltronic Company, Southfield, Mich., a corporation of Michigan

Filed Aug. 21, 1964, Ser. No. 391,084

21 Claims. (Cl. 340—172.5)

A system for reading, storing and recording information accumulated in one or more registers and for verifying the read, stored or recorded values by applying and advancing signal to each register which causes an advance according to the read, stored or recorded value. The advance signal is of a value which advances the register from its present setting to a predetermined reset value, usually zero. The failure to return any register to the predetermined reset value indicates a malfunction in the sequence, while return of all registered to the respective predetermined reset values verifies the read, stored or recorded value, whichever is used as the basis for establishing the reset signal.



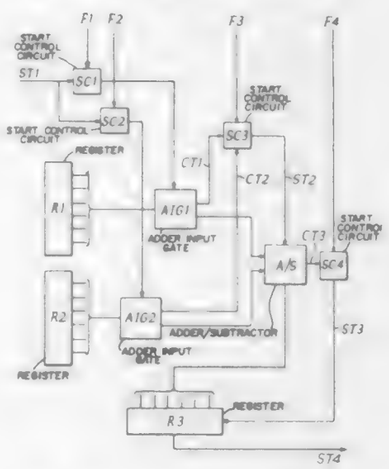
3,372,380
DATA HANDLING APPARATUS

Ronald Threadgold and David Hartley, Liverpool, England, assignors to Automatic Telephone & Electric Company Limited, Liverpool, England, a British company

Filed Sept. 8, 1964, Ser. No. 395,095

Claims priority, application Great Britain, Sept. 20, 1963, 37,141/63

6 Claims. (Cl. 340—172.5)



Data handling apparatus including control means and a plurality of functional elements arranged to be operated sequentially for carrying out a required data handling operation under the control of the control means, each functional element being arranged to perform a predetermined function on data applied to it upon the application of a start signal individual to each functional element, and in which each functional element comprises function monitoring means for deriving an output signal only upon the successful completion of its function by that functional element, and in which the start signal for each, but the first functional element in the sequence, is derived from the output signal signifying the successful completion of the function of the immediately preceding functional element and from said control means.

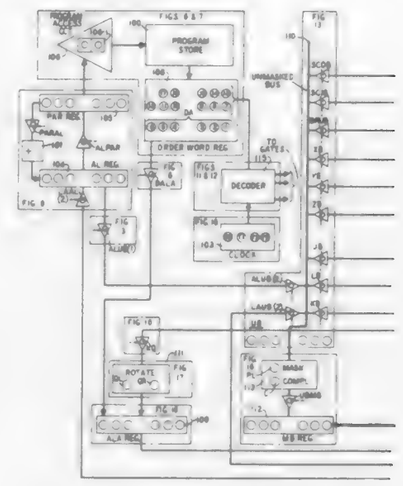
3,372,381
DIGITAL COMPUTER TEACHING MACHINE

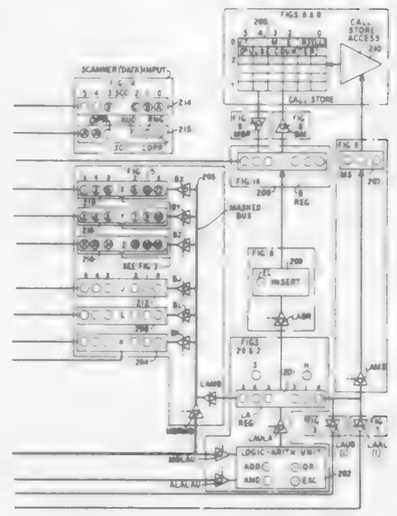
Matthew Raspanti, Lincroft, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Jan. 6, 1965, Ser. No. 423,693

10 Claims. (Cl. 340—172.5)

A word-organized stored program digital computer having a block diagram display unit which visually displays the states of various of the internal elements of the computer and various of the external equipments controlled by the computer. In the context of this disclosure, the computer controls a telephone switching system. The computer operates at a slow rate, and can even be stopped during execution of instructions, so that the visual display can be utilized as a teaching tool.



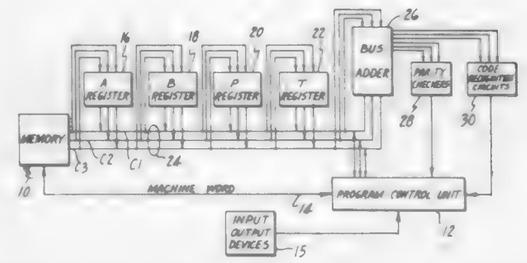


3,372,382
DATA PROCESSING APPARATUS

Erwin L. Newman, Philadelphia, Pa., assignor to Radio Corporation of America, a corporation of Delaware

Continuation of application Ser. No. 46,017, July 28, 1960. This application Aug. 16, 1965, Ser. No. 482,031

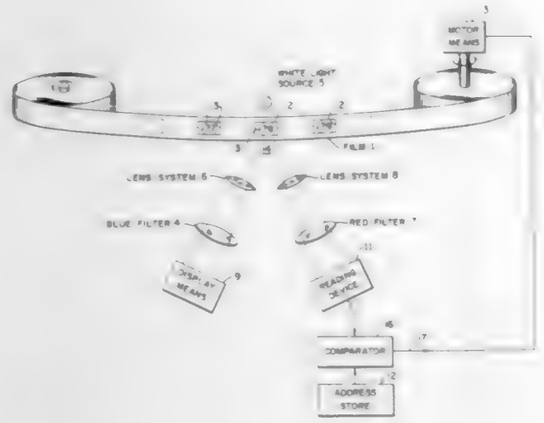
13 Claims. (Cl. 340—172.5)



5. In a data processing system employing binary coded groups of signals for representing data and wherein a parity signal is used to maintain a fixed parity in each group, an adder circuit having inputs arranged for incrementing or decrementing a number defined by a group of signals received at said inputs in accordance with one

or more control signals, a parity modifier circuit having inputs for receiving certain of said group of number signals and providing, when necessary, an output signal for modifying said parity signal of said received number signals in accordance with the amount by which said number signals are incremented or decremented, means for applying said number signal group and said parity signal to said adder circuit, means for applying said number signals and said one or more control signals to said parity modifier circuit, means for applying said parity modifier output signal to said adder circuit, and a parity checking circuit having inputs for receiving other signals representing said incremented or decremented number and providing an error signal when said received other signals have incorrect parity.

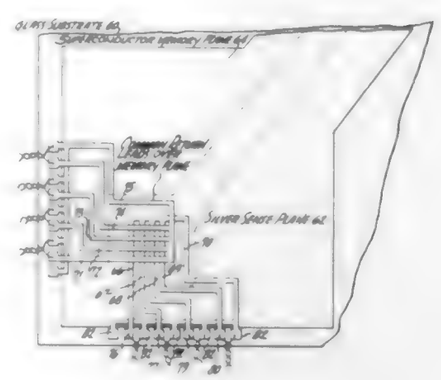
3,372,383
INFORMATION RETRIEVAL SYSTEM
Jacob J. Konen, Jr., and Max K. Muir, San Diego, Calif., assignors to General Dynamics Corporation, Rochester, N.Y., a corporation of Delaware
Filed Aug. 20, 1964, Ser. No. 390,958
3 Claims. (Cl. 340—173)



1. An information retrieval system comprising, a film bearing a plurality of display images transparent to light of a first color and a plurality of indexing images transparent to light of a second color associated with said display images and occupying the same area of said film as said display images, a viewing area, means for driving said film to present particular display images with their associated indexing images to said viewing area, first filter means positioned on said one side of said film for transmitting said display images of said first color but not said indexing images of said second color, second filter means positioned on said one side of said film for transmitting particular ones of said indexing images of said second color but not said display images of said first color, and a light source positioned on the other side of said film for causing said display images of said first color to be directed at said first filter means and for causing said indexing images of said second color to be directed at said second filter means.

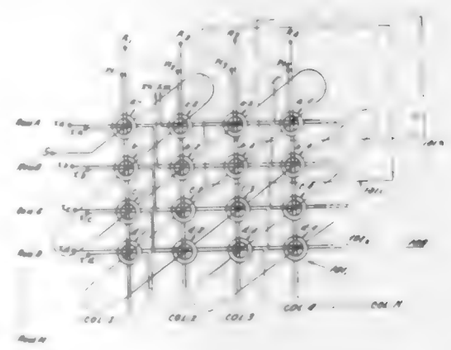
3,372,384
CRYOELECTRIC MEMORY
Richard W. Ahrons, Somerville, and David A. Christiansen, Trenton, N.J., assignors to Radio Corporation of America, a corporation of Delaware
Filed Mar. 16, 1964, Ser. No. 352,177
12 Claims. (Cl. 340—173.1)

1. In a cryoelectric memory,
a superconductor memory plane;
a plurality of drive leads which are insulated from the memory plane and lying over one surface of the memory plane; and



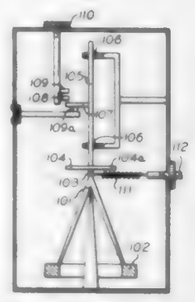
a return lead which is insulated from the memory plane, connected at one end to one end of each of said plurality of drive leads and lying over one surface of the memory plane for substantially the entire length of said return lead.

3,372,385
ELECTRIC SIGNAL DELAY CIRCUIT
Yoshiyasu Kikuchi, Shiba Mita, Minatoku, Tokyo, Japan, assignor to Nippon Electric Company Limited, a corporation of Japan
Filed Dec. 27, 1962, Ser. No. 247,607
Claims priority, application Japan, Dec. 28, 1961, 36/47,951
9 Claims. (Cl. 340—174)



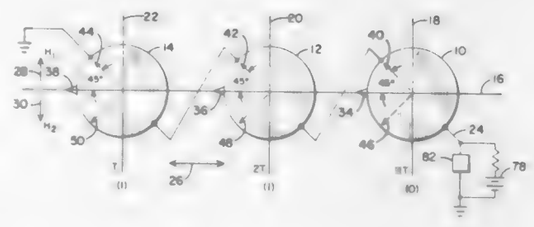
1. A variable electric signal delay means comprising:
a magnetic element matrix composed of saturable magnetic elements arranged in regular rows and columns;
columnar write-in windings each threading all magnetic elements of an associated column in said matrix;
a group of first row windings each threading all magnetic elements of an associated row of said matrix;
a group of second row windings associated with each of the rows of said matrix and threading at least one magnetic element of its associated row;
each of the second row windings threading at least one magnetic element of at least two rows other than the row with which said second row winding is associated; the magnetic elements of each row of the matrix which are threaded by a common second row winding being located in a column other than the columns occupied by the magnetic elements of adjacent rows which the common second row winding threads to effect said variable signal delay.

3,372,386
APPARATUS FOR THE DETERMINATION OF THE HORIZONTAL ACCELERATION COMPOSED OF DIFFERENT COMPONENTS IN AUTOMOTIVE VEHICLES
Paul Klinger, Vienna, Austria, assignor to Kuratorium für Verkehrssicherheit, Vienna, Austria, a corporation of Austria
Filed Feb. 15, 1965, Ser. No. 432,540
Claims priority, application Austria, Mar. 13, 1964, A 2,194/64; May 4, 1964, A 3,915/64
4 Claims. (Cl. 340—262)



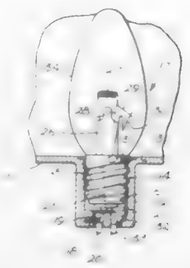
An apparatus for the determination of the amount of the horizontal acceleration composed of at least one component in automotive vehicles, comprising a housing secured to a vehicle, a pendulum mounted swingably in the housing and including a mass substantially horizontally movably disposed in the housing in at least two degrees of freedom, a disc associated with the pendulum, an electric contact device having a plurality of contacts, an indicating device connected with each of the plurality of contacts, a linkage means abutting a surface of the disc and being moved by the swinging of the pendulum by acceleration and for operating the electric contact device upon movement of the pendulum mass, wherein each of the plurality of contacts are successively operated with additional swinging of the pendulum, and two of the indicating devices are operated simultaneously in a transfer range of operation of one of the indicating devices to the next adjacent range of operation of another of the indicating devices.

3,372,387
DIGITAL TO ANALOG CONVERTER
Charles H. Tolman, Bloomington, Minn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Sept. 9, 1964, Ser. No. 395,137
5 Claims. (Cl. 340—347)



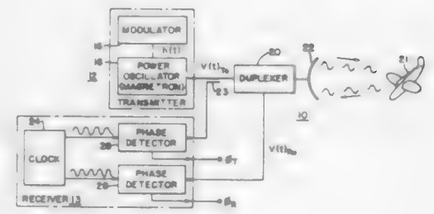
A D/A converter or code translator which utilizes magnetic thin films whose resistance varies when their magnetic vectors are rotated, whose thickness forms a geometric progression T2, T4, etc., and whose resistance changes also form a geometric progression. For *n* thin films there will be *n* discrete resistance changes or evenly spaced voltage levels produced on the output line as the magnetic vectors are rotated.

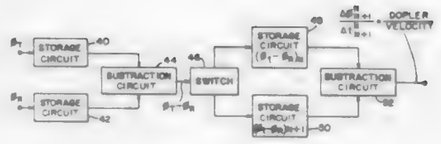
3,372,388
CHIME LIGHT
Robert A. Sanford, 6971 Cozycroft Ave., Canoga Park, Calif. 91306
Filed July 30, 1965, Ser. No. 476,092
3 Claims. (Cl. 340—371)



The chime light has a housing in the form of a horn with a socket in the wall of the housing to receive a flashing light. The flashing mechanism for the flashing light produces a sound as it turns on and off and this sound is directed to the surroundings by the housing.

3,372,389
DOPPLER RADAR SYSTEM
Brian M. Bellman, Severna Park, Guy H. Bias, Jr., Baltimore, and Thomas M. Moore, Severna Park, Md., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Feb. 13, 1967, Ser. No. 615,489
8 Claims. (Cl. 343—8)



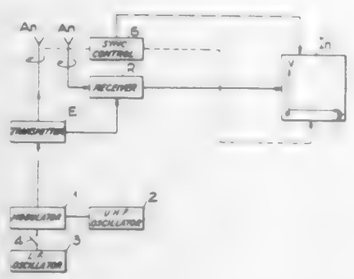


This invention relates to a Doppler radar system illustratively including a free running oscillator such as a magnetron tube for generating a high powered, transmission signal, an antenna for radiating the transmission onto a moving object and for receiving the return or echo signal, a clock for providing a continuous signal of controlled frequency, phase detecting circuitry for measuring the relative phase of the transmission signal at the time of transmission with respect to the phase of the continuous clock signal and for measuring the relative phase of the return signal at the time of reception with respect to the continuous clock signal, and computing circuitry for measuring the round trip time of the transmitted signal in terms of phase and for determining the rate of change of the round trip transmission time for successive pulses of the transmission signal.

3,372,390
DOPPLER RADAR SYSTEMS

Richard Maugué, Paris, France, assignor to CSF—Compagnie Generale de Telegraphie Sans Fil, a corporation of France

Filed Dec. 14, 1966, Ser. No. 601,781
Claims priority, application France, Dec. 17, 1965, 42,678, Patent 1,467,244
5 Claims. (Cl. 343—9)



The distance of a target to a surveillance Doppler radar system is measured, without stopping the surveillance, through sinusoidally frequency modulating the transmitted wave and evaluating the length of the spot supplied by the echo on a conventional velocity bearing indicator.

3,372,391
AUTOMATIC FREQUENCY CONTROL FOR RADAR RECEIVERS

Theodore Lerner, Buffalo, N.Y., assignor, by mesne assignments, to Bell Aerospace Corporation, Wheatfield, N.Y., a corporation of Delaware

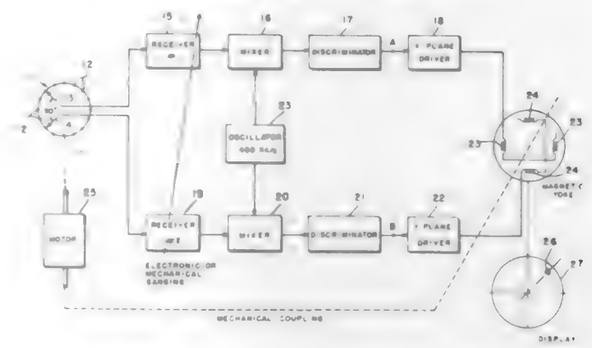
Filed Feb. 1, 1960, Ser. No. 5,881
16 Claims. (Cl. 343—17.1)

1. A radar system comprising radar pulse generator means having mechanical pulse-frequency varying means; drive means coupled with said frequency varying means for changing the tuning thereof; pulse echo receiver means having a voltage-tunable local oscillator; transducer means connected with said drive means for delivering a coarse automatic frequency control voltage for said local oscillator, said voltage having an amplitude dependent upon the position of said pulse frequency varying means; fine automatic frequency control means including a mixer receiving a sample of each transmitted pulse and the output of said local oscillator for developing an intermediate frequency, an I.F. amplifier for amplifying said intermediate frequency, a frequency discriminator for developing a fine automatic frequency control voltage for said local oscillator, said control voltage being a function of the difference in frequency between said intermediate frequency and the desired intermediate frequency; and switch means controlled in step with the radar pulse generator to connect said control voltages to correct the frequency of the local oscillator after each echo-pulse receiving period.

3,372,392
ELECTRONIC ALIDADE FOR A DIRECTION FINDER SYNCHRONOUS INDICATOR

John M. Beukers, Stony Brook, N.Y., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Army

Filed June 28, 1966, Ser. No. 562,434
7 Claims. (Cl. 343—113)

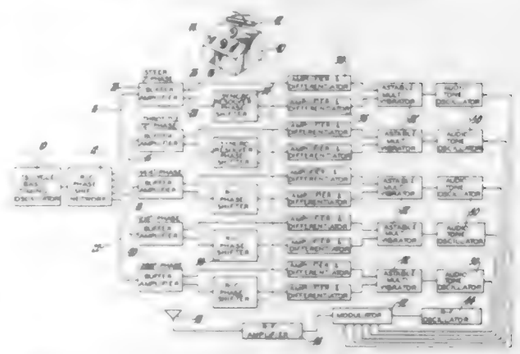


An electronic alidade for providing digital readout of both azimuth and elevation information from Doppler direction finders is provided. In its basic form the Doppler radio direction finder comprises of a number of equally spaced antenna elements which are located on the circumference of a circle. Each antenna element is sequentially connected to a receiver by means of a commutator. The receiver processes the information and it is displayed on a cathode ray screen as a dot. The distance of the dot from the center of the cathode ray tube display is a measure of the amplitude of the signal and its angular position from a reference axis is a measure of the phase angle. From this information azimuth and elevation can be determined by the operator by use of a line alidade and peripheral azimuth degree scale. In the disclosed system an electronic alidade and digital readout is provided. The electronic alidade consists of means controllable by the operator for generating a spot anywhere on the face of the cathode ray tube. The elevation and azimuth signals from the receiver are applied to the electronic alidade system. The operator manipulates two dials on the electronic alidade so as to superimpose the spot generated by the electronic alidade system on the spot generated by the Doppler direction finder. The angular positions of the dials are converted to digital information that is either displayed or printed out at the command of the operator.

3,372,393
RADIO REMOTE CONTROL SYSTEM

Roy S. Cataldo, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Apr. 5, 1965, Ser. No. 445,575
7 Claims. (Cl. 343—225)



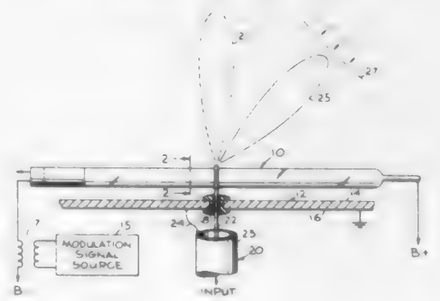
A radio remote control signal system comprising a transmitter producing a chain of distinct frequency pulses of separately variable width. Pulse width modulation is

accomplished by steering a sinusoidal waveform into two paths, one of which may be phase shifted with respect to the other and generating a tone during the time interval between like amplitude points of the original and shifted waveforms. A frequency-selective, width demodulating receiver is provided.

3,372,394
ELECTRONICALLY STEERABLE ANTENNA SYSTEM UTILIZING CONTROLLABLE DIPOLAR RESONANT PLASMA COLUMN

Irving Kaufman, Woodland Hills, Calif., assignor, by mesne assignments, to TRW Inc., a corporation of Ohio

Filed July 29, 1963, Ser. No. 298,174
6 Claims. (Cl. 343—754)



3. A radio frequency antenna system for selectively receiving electromagnetic wave energy, said system comprising:

a gas discharge device extending substantially normal to the electric field vector of said wave energy for providing, when energized, an elongated plasma column, said plasma column characteristically exhibiting dipole plasma resonance oscillation at a frequency which varies as a function of the free electron density of the plasma and characteristically exhibiting propagation of resonant frequency waves along the plasma column in a manner such that successive elemental portions oscillate in the dipole mode at successively later phase relations;

means including a current source connected to pass discharge current longitudinally through said discharge device for controlling said electron density;

means positioned adjacent said discharge device and responsive substantially only to the dipole electric fields produced by said oscillating plasma for deriving signals therefrom; and

means coupled with said current source for varying said discharge current in accordance with a predetermined function of time to thereby variably control the angular position of maximum sensitivity to impinging electromagnetic wave energy.

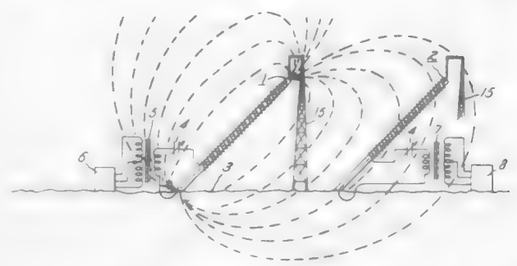
3,372,395
VLF ANTENNA

Halsey W. Kline, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York

Filed Nov. 13, 1963, Ser. No. 323,370
2 Claims. (Cl. 343—787)

1. An inductive-type antenna system for the transmission and reception of electromagnetic radiation in the very low frequency (VLF) range and including at least two relatively widely spaced-apart antennae, each antenna comprising

a magnetic core being hollow cylindrical in cross section and comprised of a relatively high permeability material, said core being disposed at an angle of approximately 45 degrees relative to the ground plane to thereby reduce interference developed by vertical and horizontal antennae systems operating at a similar frequency as said inductive-type antenna system, and

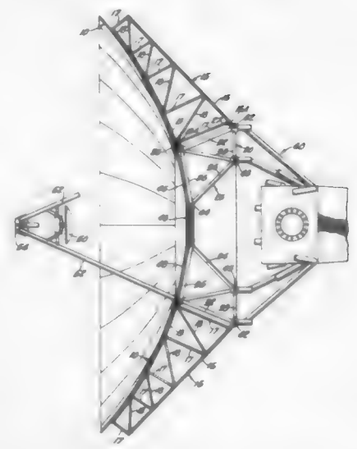


a first part of an electrical conductor wound coaxially around said core along substantially the total length thereof and electrically insulated therefrom to produce a relatively high Q inductive circuit, a second part of said conductor passing along substantially the total length of said core on the inside thereof, said core being of length h substantially shorter than conventional half wavelength straight-wire antennae operable in the very low frequency range up to 30 kilocycles per second of the electromagnetic energy spectrum and the magnitude of the product Q_h of said inductive-type antenna being in the order of the Q_h product of said straight-wire antennae.

3,372,396
CANTILEVERED PETAL-BEAM PARABOLIC ANTENNA REFLECTOR

Alfonso A. Braccini, La Mesa, Calif., assignor to Whittaker Corporation, Los Angeles, Calif., a corporation of California

Filed Oct. 16, 1964, Ser. No. 404,342
3 Claims. (Cl. 343—916)

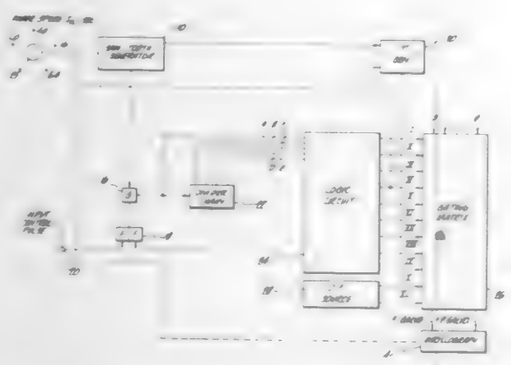


A reflector for microwave energy consists of twenty-four cantilevered assemblies supported from a rigid torus. High structural efficiency is obtained by making the reflective panels and centrally disposed radial beams integral composite structures, with the reflective panels contributing bending stiffness to the radial beams. Additional stiffness is achieved by interconnecting the panels and by circumferentially connecting the radial beams to intercostal members which serve to stabilize and support the panel edges. The individual reflective panels are secured rigidly and permanently to the reflector's backup structure, the shape of the individual panels being accurately established at that time. At assembly, the individual panels are aligned with each other and a pair of fastening means on the ends of each centrally disposed radial beam is secured to spaced points on the torus.

3,372,397
TRAVEL RECORDING APPARATUS FOR COAL CUTTERS OR OTHER MINING MACHINES
Pierre Louis Joseph Tison, Saint-Avold, Moselle, France, assignor to Houilleres du Bassin de Lorraine, Merlebach, Moselle, France
Filed Sept. 22, 1965, Ser. No. 489,351
Claims priority, application France, Sept. 25, 1964, 989,354, Patent 86,439
6 Claims. (Cl. 346—33)

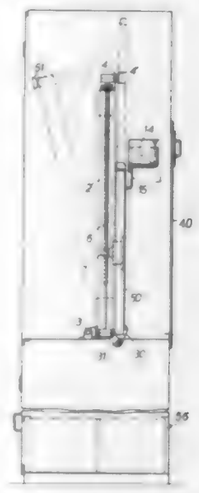
Travel recording apparatus for coal cutters or other mining machines, comprising a pulse generator incorporated in the coal cutter and generating two bits of logic initial information the values of which are a function of the position of the rotating shaft on the winch which is mechanically interconnected with the chain used to haul the coal cutter, and, above ground, a transit detector which receives these initial bits of information and delivers an addition or subtraction pulse according thereto, and a recording unit operated by said addition and subtraction pulses.

3,372,398
VARIABLE SPEED CHARACTER GENERATOR
John Lennox Nairn and Dale Eugene La Plante, Pasadena, Calif., assignors to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Filed Jan. 21, 1966, Ser. No. 522,282
8 Claims. (Cl. 346—33)



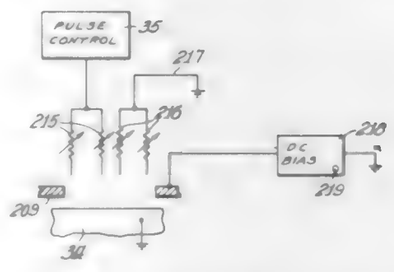
6. In a digital oscillograph in which the drive speed of the paper may be set at any one of a number of rates, a waveform generator for generating a plurality of waveforms in which the time scale can change with changes in speed of the paper to maintain fixed vertical size and shape of each character, comprising a first sawtooth generator, means for changing the frequency of the sawtooth generator with changes in the paper drive speed, a circuit generating a plurality of rectangular wave output signals having repetition frequencies that are multiples of the repetitive frequency of an input signal, means for driving the rectangular wave circuit in response to the output of the sawtooth generator, and means for combining portions of the outputs from the rectangular wave circuit and the sawtooth generator to generate a plurality of output signals having waveforms in which the slope of all leading and trailing edges are fixed by the slope of the sawtooth generator output.

3,372,399
RECORDER WITH PIVOTALLY MOUNTED CHART TRANSPORT UNIT
Arthur Ernest Mason, Riplingham, Brough, England, assignor to The Associated Portland Cement Manufacturers Limited, London, England, a corporation of the United Kingdom
Filed Oct. 4, 1966, Ser. No. 584,128
Claims priority, application Great Britain, Oct. 5, 1965, 42,195/65
7 Claims. (Cl. 346—49)



The guide frame and drive for a linearly movable flat chart support is pivotally mounted at an end remote from the bank of recording pens to permit movement of the entire assembly out of the plane of the pens both for replacement of the chart and return of the chart support to a starting position. Auxiliary motor means, normally declutched, is provided for rapid drive of the support back to its start position when the normal drive motor is declutched.

3,372,400
ELECTROSTATIC RECORDER WITH PLURAL ELECTRODES AND BIASED MASK
Herman Epstein, Philadelphia, and George A. Harris, Malvern, Pa., Edward M. Johnson, Detroit, Mich., and Thomas L. Thourson, Arlington Heights, Ill., assignors, by mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Dec. 3, 1962, Ser. No. 241,839
9 Claims. (Cl. 346—74)



1. In a system for impressing electric charges on a dielectric medium in an information-denoting pattern, a charging station including an array comprising at least two pin electrodes positioned on the same side of said medium and having extremities disposed in substantially the same plane, which array is operable as energized to produce a discharge between the electrode extremities and provide a single cloud of said electric charges, occlusion means defining an aperture between said array and said medium, the solid portion of said occlusion means blocking certain of said electric charges and said aperture passing others of said electric charges to shape said cloud of electric charges and thus regulate the definition of the charged area deposited on said medium, means for applying a bias voltage to said occlusion means to assist in displacing said cloud of electric charges through said aperture to provide a charged area on said dielectric medium, and means for effecting relative movement between said array and said medium as said array is selectively energized to provide on the medium an information pattern comprising charged and non-charged areas.

DESIGNS

MARCH 5, 1968

210,347
SOCCER SHOE
Paolo Riva, Via G. Verdi 3, Rudiano, Brescia, Italy

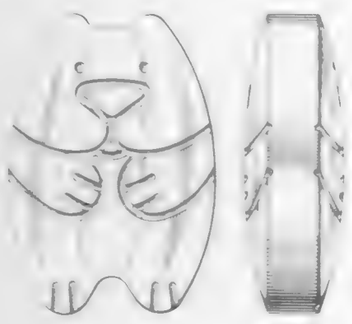
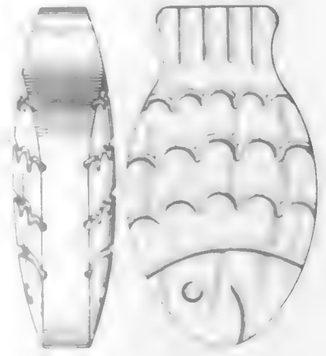
210,363
VEHICLE SEAT
Chester J. Barecki, Grand Rapids, Mich., assignor to American Seating Company, Grand Rapids, Mich., a corporation of Delaware
Filed Nov. 25, 1966, Ser. No. 4,809
Term of patent 14 years
(Cl. D15—8)

210,364
MULTIPLE SEATING UNIT FOR AN AUDITORIUM
William S. Lindberg, Grand Rapids, Mich., assignor to American Seating Company, Grand Rapids, Mich., a corporation of Delaware
Filed Jan. 5, 1967, Ser. No. 5,319
Term of patent 14 years
(Cl. D15—8)

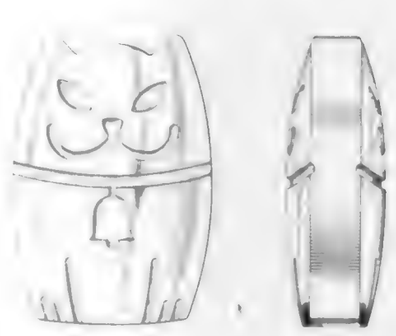
210,365
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,121
Term of patent 14 years
(Cl. D16—3)



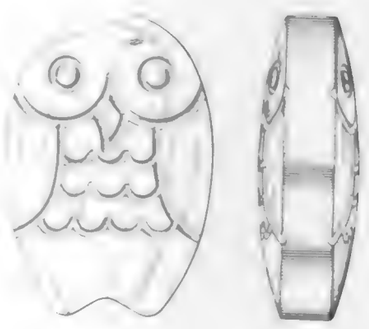
210,366
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,124
Term of patent 14 years
(Cl. D16—3)



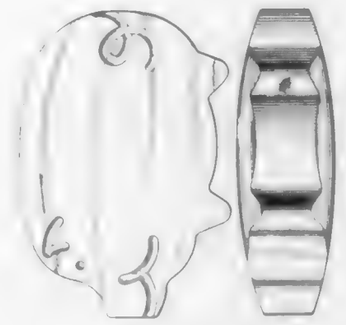
210,367
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,125
Term of patent 14 years
(Cl. D16—3)



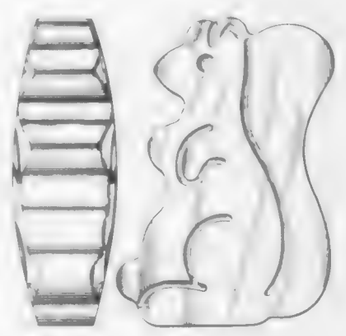
210,368
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,133
Term of patent 14 years
(Cl. D16—3)



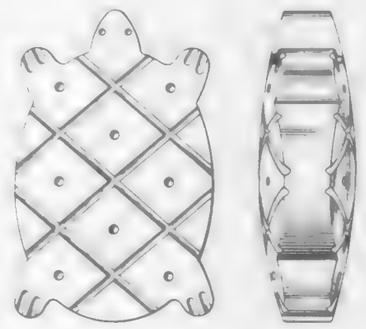
210,369
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,134
Term of patent 14 years
(Cl. D16—3)



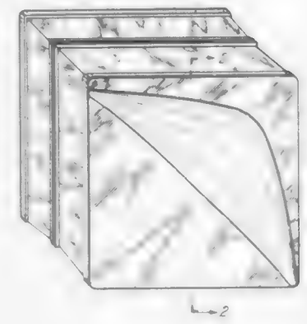
210,370
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,135
Term of patent 14 years
(Cl. D16—3)



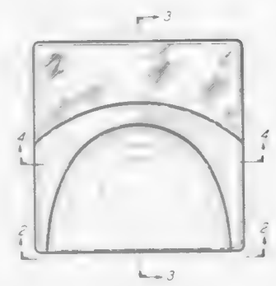
210,371
VITAMIN TABLET OR SIMILAR ARTICLE
Luther H. Kroninger, Jr., and Dean R. Straka, Evansville, Ind., assignors to Mead Johnson & Company, a corporation of Indiana
Filed Mar. 8, 1967, Ser. No. 6,136
Term of patent 14 years
(Cl. D16—3)



210,372
TRANSLUCENT BUILDING BLOCK OR THE LIKE
Donald J. Behnk, Allison Park, Pa., and Wesley E. Lerdon, Houston, Tex., assignors to Pittsburgh Corning Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Apr. 19, 1967, Ser. No. 6,756
Term of patent 14 years
(Cl. D18—2)



210,373
TRANSLUCENT BUILDING BLOCK OR THE LIKE
Donald J. Behnk, Allison Park, Pa., and Wesley E. Lerdon, Houston, Tex., assignors to Pittsburgh Corning Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Apr. 19, 1967, Ser. No. 6,759
Term of patent 14 years
(Cl. D18—2)

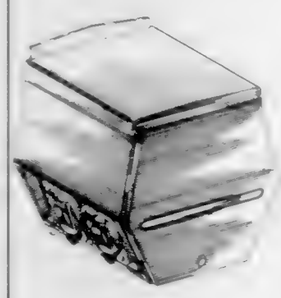


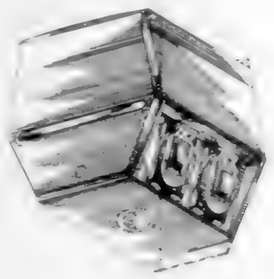
210,374
CARRYING HANDLE FOR A REFRIGERANT CYLINDER
Robert B. Schaefer, Malvern, Pa., assignor to Pennsalt Chemicals Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed Feb. 8, 1967, Ser. No. 5,732
Term of patent 14 years
(Cl. D23—1)

210,375
FREE STANDING FIREPLACE
Stanley W. Volk, Los Angeles, Calif. (% Space Planner Co., 10213 Riverside Drive, North Hollywood, Calif. 91602)
Filed June 13, 1966, Ser. No. 2,663
Term of patent 14 years
(Cl. D23—97)

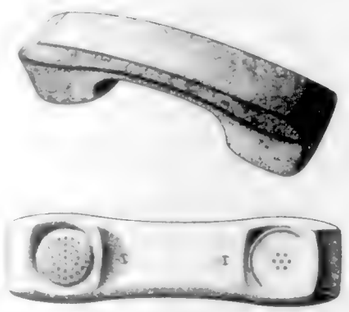
210,376
SOLAR SYSTEM MODEL
Edward R. Gaul, 8555 Trouville Ave., Playa Del Rey, Calif. 90291, and Joseph L. Gaul, 912 Longwood Ave., Los Angeles, Calif. 90019
Filed Dec. 16, 1966, Ser. No. 5,068
Term of patent 14 years
(Cl. D25—1)

210,377
ELECTRICAL DISTRIBUTION UNIT
Rodrigo Lopez-Fabrega, Norwalk, and Kenneth Van Dyck, Southport, Conn., assignors to Harvey Hubbell, Incorporated, Bridgeport, Conn., a corporation of Connecticut
Filed June 29, 1966, Ser. No. 2,850
Term of patent 14 years
(Cl. D26—5)

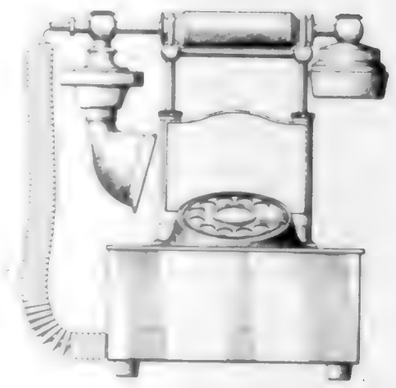


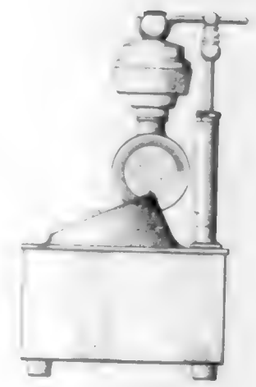


210,378
TELEPHONE HANDSET
George D. Perkins, Pasadena, Calif., assignor to American Telecommunication Corporation, Los Angeles, Calif., a corporation of California
Filed July 20, 1967, Ser. No. 7,903
Term of patent 14 years
(Cl. D26—14)

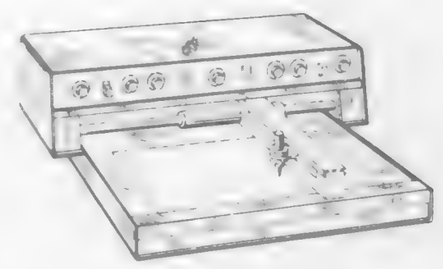


210,379
FRENCH CRADLE TELEPHONE
George D. Perkins, Pasadena, Calif., assignor to American Telecommunication Corporation, Los Angeles, Calif., a corporation of California
Filed July 20, 1967, Ser. No. 7,904
Term of patent 14 years
(Cl. D26—14)

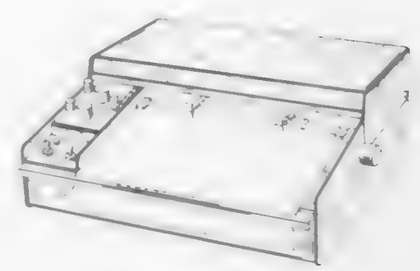




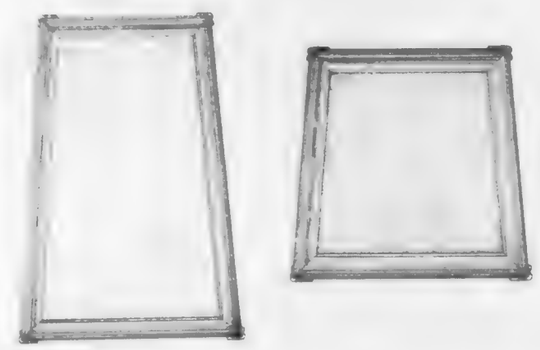
210,380
GRAPHIC RECORDER
Anthony P. H. Chan, Palo Alto, Calif., assignor to Varian Associates, Palo Alto, Calif., a corporation of California
Filed Aug. 7, 1967, Ser. No. 8,151
Term of patent 14 years
(Cl. D26—14)



210,381
GRAPHIC RECORDER
Anthony P. H. Chan, Palo Alto, Calif., assignor to Varian Associates, Palo Alto, Calif., a corporation of California
Filed Aug. 14, 1967, Ser. No. 8,265
Term of patent 14 years
(Cl. D26—14)



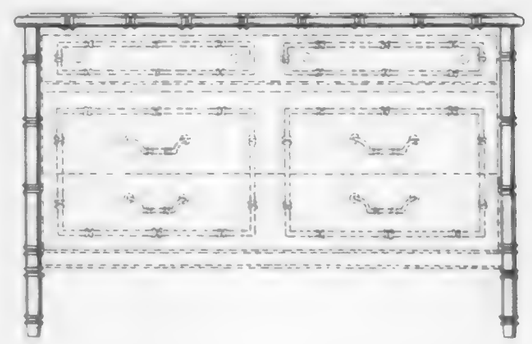
210,382
LOUDSPEAKER CABINET
Thomas Lane, Worth, Ill., assignor to The Muter Company, Chicago, Ill., a corporation of Illinois
Filed Aug. 17, 1967, Ser. No. 8,304
Term of patent 14 years
(Cl. D26—14)



210,383
ILLUMINABLE WINDOW DECORATION
Charles S. La Montagne, 8526 Janis, Utica, Mich. 48087
Filed July 5, 1966, Ser. No. 2,931
Term of patent 14 years
(Cl. D29—1)

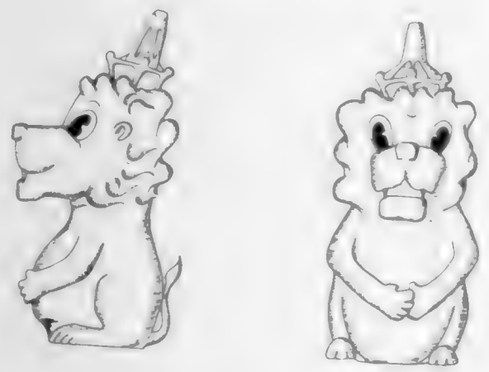
210,384
CHRISTMAS TREE ORNAMENT OR SIMILAR ARTICLE
Jack Burnbaum, 451 D St., Newton, Mass. 02110
Filed Oct. 24, 1966, Ser. No. 4,413
Term of patent 14 years
(Cl. D29—1)

210,385
FURNITURE CHEST
Richard G. Barr, Watchung, N.J., assignor to Thomasville Furniture Industries, Inc., Thomasville, N.C., a corporation of North Carolina
Filed Oct. 11, 1966, Ser. No. 4,240
Term of patent 14 years
(Cl. D33—6)



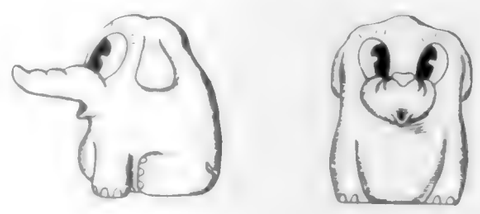
210,386
TABLE OR SIMILAR ARTICLE
Vladimir Kagan, 1225 Park Ave., New York, N.Y. 10028
Filed Mar. 10, 1967, Ser. No. 6,159
Term of patent 14 years
(Cl. D33—14)

210,387
TOY ANIMAL FIGURE OR THE LIKE
Kenneth L. Gillibrand, 13 Rudd Road, Illovo, Johannesburg, Transvaal, Republic of South Africa
Filed Feb. 15, 1966, Ser. No. 1,046
Term of patent 14 years
Claims priority, application Republic of South Africa Aug. 26, 1965
(Cl. D34—2)

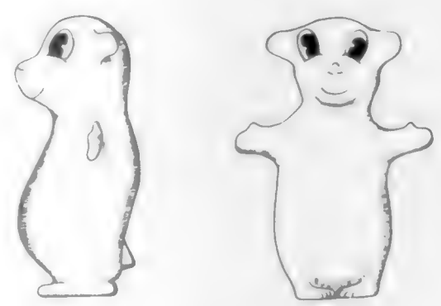


210,388
TOY ANIMAL FIGURE OR THE LIKE
Kenneth L. Gillibrand, 13 Rudd Road, Illovo, Johannesburg, Transvaal, Republic of South Africa
Filed Feb. 15, 1966, Ser. No. 1,050
Term of patent 14 years
Claims priority, application Republic of South Africa Aug. 26, 1965
(Cl. D34—2)

210,389
TOY ANIMAL FIGURE OR THE LIKE
Kenneth L. Gillibrand, 13 Rudd Road, Illovo, Johannesburg, Transvaal, Republic of South Africa
Filed Feb. 15, 1966, Ser. No. 1,051
Term of patent 14 years
Claims priority, application Republic of South Africa Aug. 26, 1965
(Cl. D34—2)



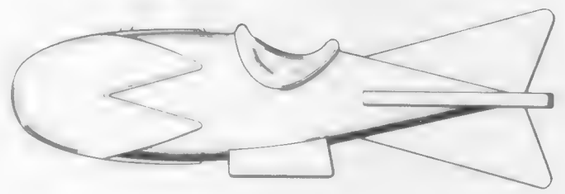
210,390
TOY ANIMAL FIGURE OR THE LIKE
Kenneth L. Gillibrand, 13 Rudd Road, Illovo, Johannesburg, Transvaal, Republic of South Africa
Filed Feb. 15, 1966, Ser. No. 1,052
Term of patent 14 years
Claims priority, application Republic of South Africa Aug. 26, 1965
(Cl. D34—2)



210,391
TOY ANIMAL FIGURE OR THE LIKE
Kenneth L. Gillibrand, 13 Rudd Road, Illovo, Johannesburg, Transvaal, Republic of South Africa
Filed Feb. 15, 1966, Ser. No. 1,053
Term of patent 14 years
Claims priority, application Republic of South Africa Aug. 26, 1965
(Cl. D34—2)

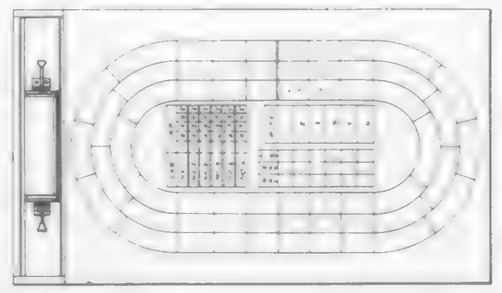
210,392
DOLL OR SIMILAR ARTICLE
Henrietta Valis, 3508 Mermaid Ave., Brooklyn, N.Y. 11224
Filed Dec. 6, 1965, Ser. No. 75
Term of patent 7 years
(Cl. D34—4)

210,393
ROCKET-SHAPED SEAT FOR PLAYGROUND APPARATUS
Robert S. Wormser, Hillsdale, Mich., assignor to Game-Time, Inc., Litchfield, Mich., a corporation of Michigan
Filed Aug. 17, 1966, Ser. No. 3,511
Term of patent 14 years
(Cl. D34—5)

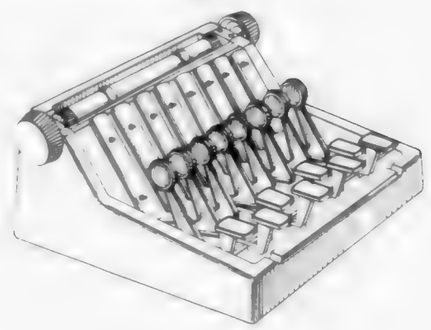


210,394
GOLF CLUB GRIP
John J. Baker, Laguna Hills, Calif., assignor to W. J. Voit Rubber Corporation, a corporation of California
Filed July 13, 1967, Ser. No. 7,795
Term of patent 14 years
(Cl. D34—5)

210,395
GAMEBOARD
William C. Royston, 2193 Meadowview Road, Sacramento, Calif. 95832
Filed July 21, 1967, Ser. No. 7,931
Term of patent 14 years
(Cl. D34—5)

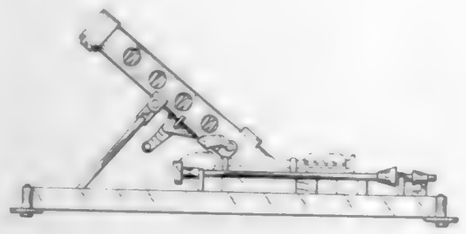


210,396
MUSICAL TYPEWRITER TOY
Robert I. Genin, Scarsdale, N.Y., assignor to Child Guidance Toys Inc., Bronx, N.Y., a corporation of New York
Filed Dec. 30, 1966, Ser. No. 5,246
Term of patent 14 years
(Cl. D34—15)



210,397
TOY WHEEL CENTER DISC
William H. Edwards, 25 Blythewood Drive, Greenville, S.C. 29607
Filed Jan. 3, 1967, Ser. No. 5,273
Term of patent 14 years
(Cl. D34—15)

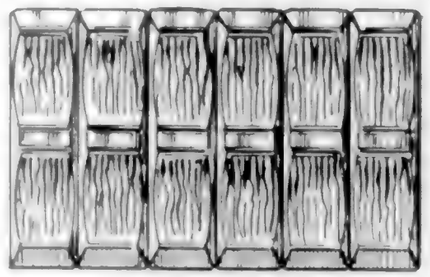
210,398
ROCKET-LAUNCHING TOY
John W. Ryan, Los Angeles, and John H. Northrop, La Canada, Calif., assignors to Mattel, Inc., a corporation of California
Filed Feb. 1, 1967, Ser. No. 5,659
Term of patent 14 years
(Cl. D34—15)



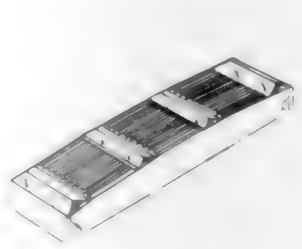
210,399
SOUP SKIMMER
Herman A. Wichmann, 4449 N. Menard Ave., Chicago, Ill. 60630
Filed July 26, 1967, Ser. No. 7,988
Term of patent 14 years
(Cl. D44—29)

210,400
EXPANSIBLE LINK CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Karl C. Augenstein, Cranston, R.I., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed Feb. 21, 1967, Ser. No. 5,891
Term of patent 14 years
(Cl. D45—4)

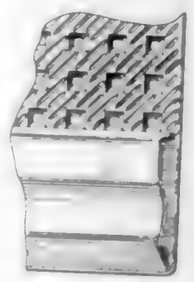
210,401
EXPANSIBLE LINK CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Karl C. Augenstein, Cranston, R.I., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed Feb. 21, 1967, Ser. No. 5,895
Term of patent 14 years
(Cl. D45—4)



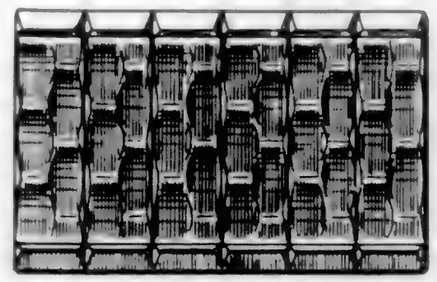
210,402
EXPANSIBLE LINK CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Karl C. Augenstein, Cranston, R.I., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed Feb. 21, 1967, Ser. No. 5,897
Term of patent 14 years
(Cl. D45—4)



210,403
EXPANSIBLE LINK CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Murray L. Cowan, Norwood, Mass., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed Mar. 1, 1967, Ser. No. 6,015
Term of patent 14 years
(Cl. D45—4)



210,404
EXPANSIBLE LINK CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Murray L. Cowan, Norwood, Mass., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed Mar. 1, 1967, Ser. No. 6,023
Term of patent 14 years
(Cl. D45—4)

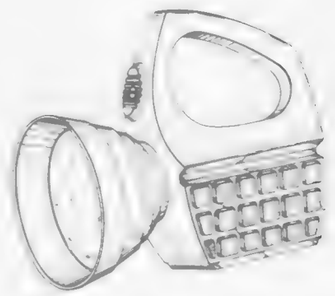


210,405
LOCKET
David Weissmann, Palos Verdes Estates, Calif., assignor to Mattel, Inc., a corporation of California
Filed Mar. 1, 1967, Ser. No. 6,021
Term of patent 14 years
(Cl. D45—15)

210,406
COMBINED LOCKET AND DOLL
David Weissmann, Palos Verdes Estates, Calif., assignor to Mattel, Inc., a corporation of California
Filed Mar. 1, 1967, Ser. No. 6,022
Term of patent 14 years
(Cl. D45—15)

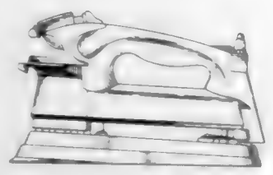
210,407
LIGHT FIXTURE
Raoul E. Rodriguez, 2521 N. Burling St., Chicago, Ill. 60614
Filed Nov. 6, 1967, Ser. No. 9,287
Term of patent 14 years
(Cl. D48—20)

210,408
ELECTRIC BATTERY LANTERN
Ian A. Tesar, Eastchester, N.Y., assignor to Herbert J. Ashe, % The H. J. Ashe Company, Inc., South Norwalk, Conn.
Filed Dec. 13, 1966, Ser. No. 5,023
Term of patent 14 years
(Cl. D48—24)

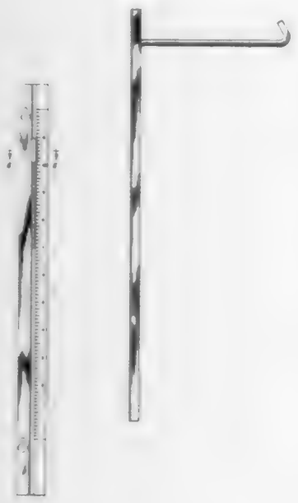


210,409
DENTURE CLEANING UNIT
Melvin H. Boldt, Glenview, Ill., assignor to Schick Electric Inc., Lancaster, Pa., a corporation of Delaware
Filed July 7, 1967, Ser. No. 7,732
Term of patent 14 years
(Cl. D49—1)

210,410
ELECTRIC IRON
Gordon W. Florian, Fairfield, Conn., assignor to Proctor-Silex Incorporated, Philadelphia, Pa., a corporation of New York
Filed Aug. 10, 1967, Ser. No. 8,214
Term of patent 14 years
(Cl. D49—6)

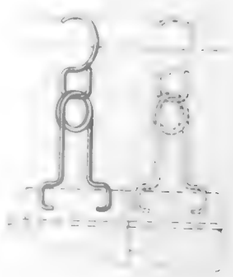


210,411
HEIGHT MEASURING STICK
Edward F. Joyce 3rd, 205 Rockaway St., Boonton, N.J. 07005
Filed June 5, 1967, Ser. No. 7,360
Term of patent 3½ years
(Cl. D52—6)



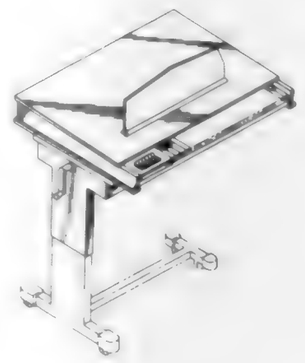
210,412
COMBINATION SPARE TIRE AND WHEEL CARRIER ASSEMBLY
Frank Cooper, 820 W. Lawrence, Charlotte, Mich. 48813
Filed Nov. 21, 1966, Ser. No. 4,756
Term of patent 7 years
(Cl. D54—1)

210,413
HANGER FOR BOOTS OR THE LIKE
George J. Ducharme, 3731 Griffith View Drive, Los Angeles, Calif. 90039
Filed Apr. 10, 1967, Ser. No. 6,601
Term of patent 7 years
(Cl. D54—1)

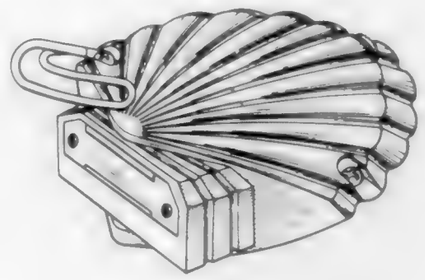


210,414
SWITCH COVER AND WIRE CONDUIT UNIT FOR A WASTE DISPOSER
James H. Enright and Charles A. Wicke, Racine, Wis., assignors to In-Sink-Erator Manufacturing Company, Racine, Wis., a corporation of Wisconsin
Filed Dec. 12, 1966, Ser. No. 4,996
Term of patent 14 years
(Cl. D55—1)

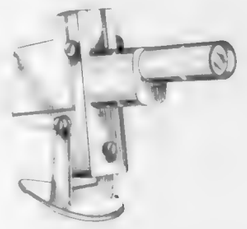
210,415
KEYBOARD INSTRUMENT
Jerome Markowitz, Allentown, Pa., assignor to Allen Organ Co., Macumgie, Pa., a corporation of Pennsylvania
Filed Apr. 22, 1966, Ser. No. 1,983
Term of patent 14 years
(Cl. D56—2)



210,416
RADIO RECEIVER OR SIMILAR ARTICLE
Hiloshi Hitsuoka, 107 Ogikashi, Oaza, Saitama-ken, Kawagoe-shi, Japan
Filed Jan. 20, 1966, Ser. No. 755
Claims priority, application Japan July 31, 1965
Term of patent 14 years
(Cl. D56—4)

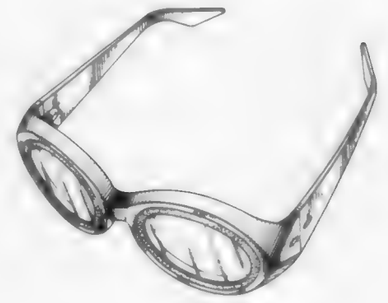


210,417
VISUAL ACUITY SLIDE PROJECTOR
Paul A. Hoogesteger, Brighton, N.Y., assignor to Bausch & Lomb Incorporated, Rochester, N.Y., a corporation of New York
Filed Aug. 18, 1966, Ser. No. 3,525
Term of patent 14 years
(Cl. D57—1)

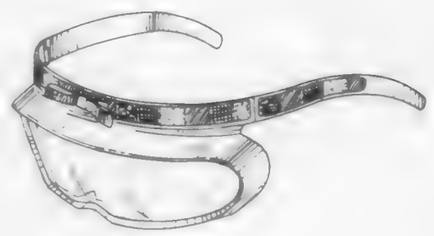


210,418
SPECTACLE FRAME OR THE LIKE
Jack Bloch, Leominster, and Vitalino Marchi, Concord, Mass., assignors to Foster Grant Co., Inc., Leominster, Mass., a corporation of Delaware
Filed Dec. 30, 1966, Ser. No. 5,230
Term of patent 14 years
(Cl. D57—1)

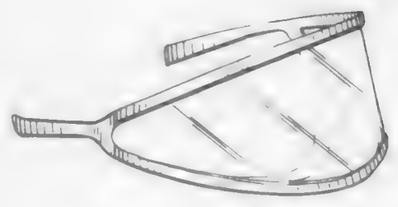
210,419
PAIR OF SPECTACLES
Jack Bloch, Leominster, and Vitalino Marchi, Concord, Mass., assignors to Foster Grant Co., Inc., Leominster, Mass., a corporation of Delaware
Filed Dec. 30, 1966, Ser. No. 5,231
Term of patent 14 years
(Cl. D57—1)



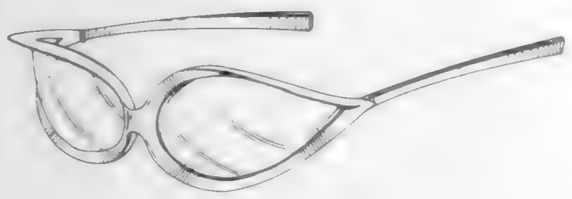
210,420
PAIR OF SUNGLASSES OR THE LIKE
Atherton R. Mitchell, Dillon Beach, Calif., assignor to Renauld International, Ltd., Burlingame, Calif., a corporation of Delaware
Filed Jan. 31, 1967, Ser. No. 5,627
Term of patent 14 years
(Cl. D57—1)



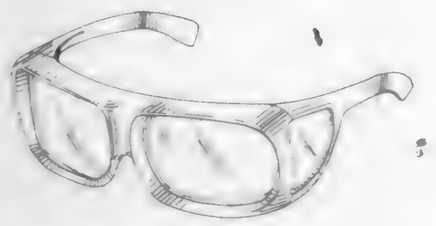
210,421
PAIR OF SUNGLASSES OR THE LIKE
Atherton R. Mitchell, Dillon Beach, Calif., assignor to Renauld International, Ltd., Burlingame, Calif., a corporation of Delaware
Filed Jan. 31, 1967, Ser. No. 5,628
Term of patent 14 years
(Cl. D57—1)



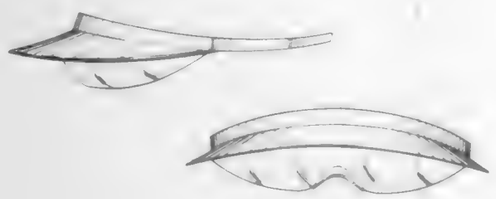
210,422
PAIR OF SUNGLASSES OR THE LIKE
Atherton R. Mitchell, Dillon Beach, Calif., assignor to Renauld International, Ltd., Burlingame, Calif., a corporation of Delaware
Filed Jan. 31, 1967, Ser. No. 5,631
Term of patent 14 years
(Cl. D57—1)



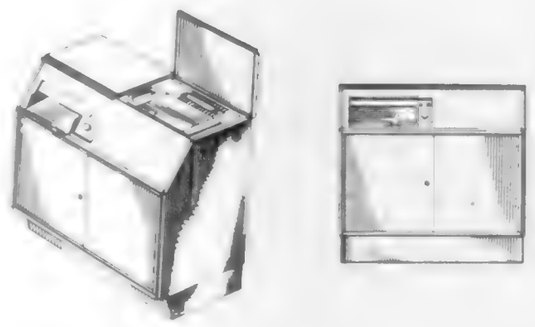
210,423
PAIR OF SUNGLASSES OR THE LIKE
Atherton R. Mitchell, Dillon Beach, Calif., assignor to Renauld International, Ltd., Burlingame, Calif., a corporation of Delaware
Filed Jan. 31, 1967, Ser. No. 5,632
Term of patent 14 years
(Cl. D57—1)



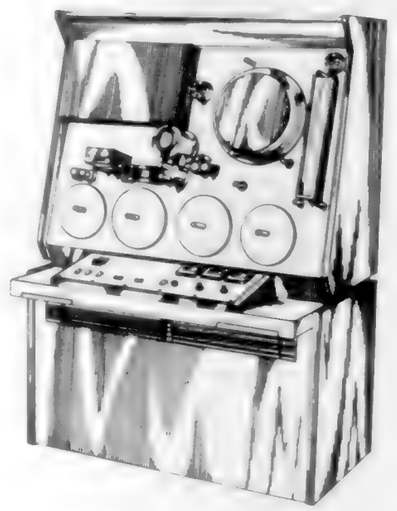
210,424
PAIR OF SUNGLASSES OR THE LIKE
Atherton R. Mitchell, Dillon Beach, Calif., assignor to Renauld International, Ltd., Burlingame, Calif., a corporation of Delaware
Filed Apr. 24, 1967, Ser. No. 6,801
Term of patent 14 years
(Cl. D57—1)



210,425
PHOTOCOPIER OR SIMILAR ARTICLE
Charles Jerabek, Bayshore, N.Y., assignor to Copia Manufacturing Corporation, Garden City, N.Y. a corporation
Filed Apr. 27, 1966, Ser. No. 2,041
Term of patent 14 years
(Cl. D61—1)

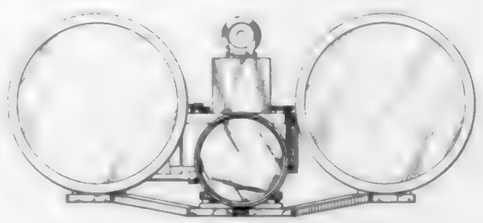


210,426
APPARATUS FOR EXPOSING AND DEVELOPING LIGHT SENSITIVE PHOTOGRAPHIC FILM
Roy E. Hurtig, Monte Sereno, Calif., assignor to Kalvar Corporation, New Orleans, La., a corporation of Louisiana
Filed Dec. 15, 1966, Ser. No. 5,053
Term of patent 14 years
(Cl. D61—1)

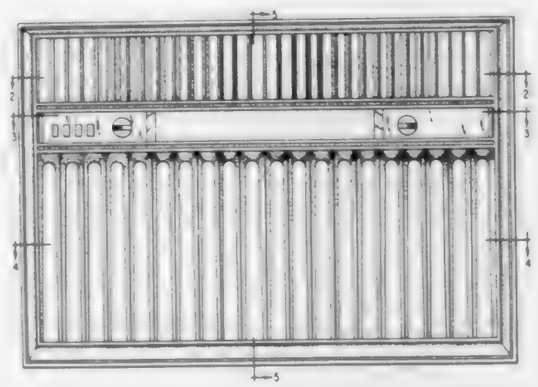


210,427
ELECTROSTATIC COPYING MACHINE
Joel W. Bravo, Montrose, Pa., and Paul Matwey, Binghamton, N.Y., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware
Filed Jan. 20, 1967, Ser. No. 5,500
Term of patent 14 years
(Cl. D61—1)

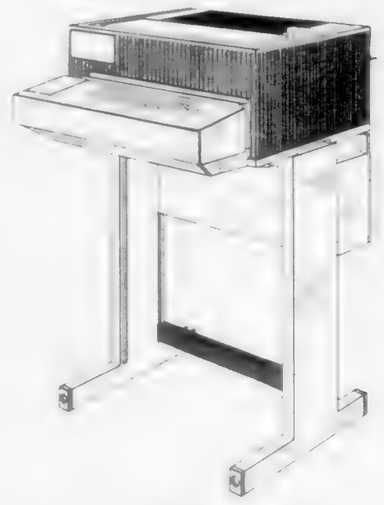
210,428
CAMERA FOR INFRARED PHOTOGRAPHY OR SIMILAR ARTICLE
Tohru Karikawa, Tokyo, Japan, assignor to Asahi Kogaku Kogyo Kabushiki Kaisha, Itabashi-ku, Tokyo-to, Japan
Filed Jan. 27, 1967, Ser. No. 5,585
Term of patent 14 years
Claims priority, application Japan Aug. 16, 1966
(Cl. D61—1)



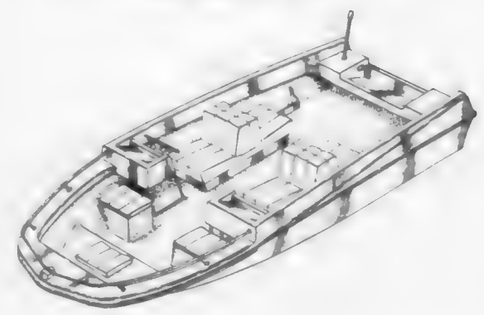
210,429
AIR CONDITIONING CABINET FRONT OR SIMILAR ARTICLE
Joseph B. Federico, Rochester, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Mar. 1, 1967, Ser. No. 6,024
Term of patent 3½ years
(Cl. D23—141)



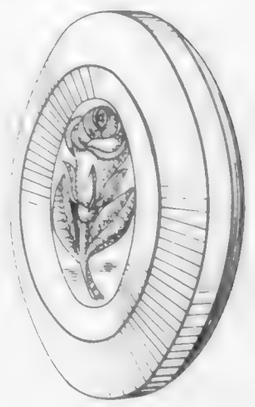
210,430
TELEPRINTER CONSOLE
Ettore Sottsass, Milan, Italy, assignor to Ing. C. Olivetti & C., S.p.A., Ivrea, Italy, a corporation of Italy
Filed Dec. 16, 1966, Ser. No. 5,072
Term of patent 14 years
Claims priority, application Italy June 27, 1966
(Cl. D64—11)



210,431
BOAT
William L. Raschke, Box 576, Three Rivers, Tex. 78071
Filed June 20, 1967, Ser. No. 7,529
Term of patent 14 years
(Cl. D71—1)



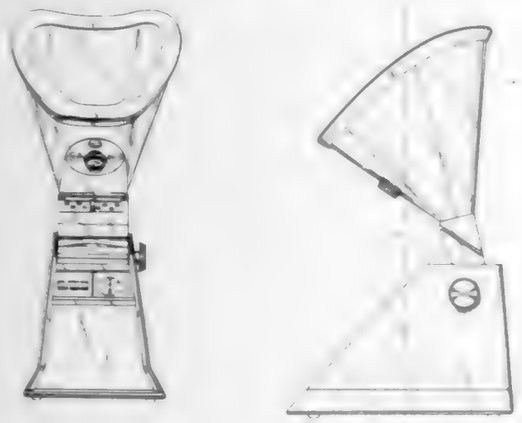
210,432
BAR OF SOAP OR SIMILAR ARTICLE
Victor Koenigsberg, Franklin Square, N.Y., assignor to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware
Filed Mar. 9, 1967, Ser. No. 6,147
Term of patent 14 years
(Cl. D73—1)



210,433
INK MARKING INSTRUMENT OR THE LIKE
Noboru Wakai, Tokyo, Japan, assignor to Dai Nihon Bungu Co., Ltd., Tokyo, Japan, a corporate body of Japan
Filed Aug. 12, 1966, Ser. No. 3,457
Term of patent 14 years
Claims priority, application Japan Feb. 15, 1966
(Cl. D74—17)

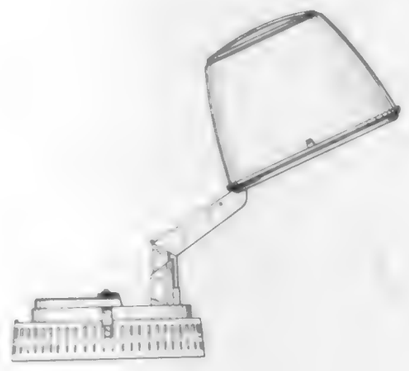
210,434
GARMENT HANGER
John H. Batts, Grand Rapids, Mich., assignor to John Thomas Batts, Inc., Zeeland, Mich., a corporation of Michigan
Filed Feb. 13, 1967, Ser. No. 5,815
Term of patent 14 years
(Cl. D80—8)

210,435
FACIAL VAPORIZER
Melvin H. Boldt, Glenview, Ill., assignor to Schick Electric Inc., Lancaster, Pa., a corporation of Delaware
Filed July 7, 1967, Ser. No. 7,728
Term of patent 14 years
(Cl. D83—1)



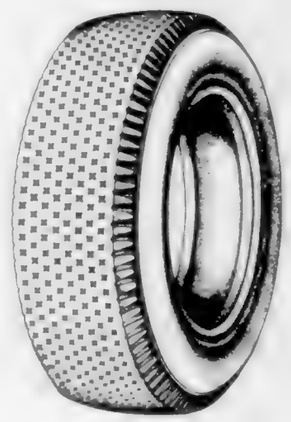
210,436
HAIR ROLLER
Patrick R. Jeronimus, Park Forest, Ill., assignor to The Gillette Company, Boston, Mass., a corporation of Delaware
Filed Nov. 28, 1966, Ser. No. 4,835
Term of patent 14 years
(Cl. D86—10)

210,437
HAIR DRYER OR SIMILAR ARTICLE
Melvin H. Boldt, Glenview, Ill., assignor to Schick Electric Inc., Lancaster, Pa., a corporation of Delaware
Filed May 18, 1967, Ser. No. 7,175
Term of patent 14 years
(Cl. D86—10)

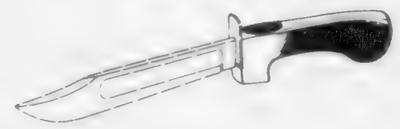


210,438
TIRE
Raymond P. Hawkinson, Minneapolis, Minn., assignor to Paul E. Hawkinson Company, Minneapolis, Minn., a corporation of Minnesota
Filed Apr. 25, 1966, Ser. No. 1,995
Term of patent 14 years
(Cl. D90—20)

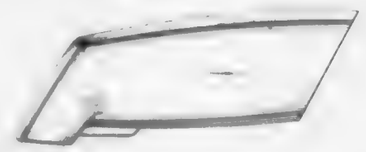
210,439
TIRE
Horace V. Barlow, Roma, Hampton-on-the-Hill, Warwick, England, assignor to Dunlop Rubber Company, Limited, Erdington, England, a British corporation
Filed July 7, 1966, Ser. No. 2,981
Term of patent 14 years
Claims priority, application Great Britain Jan. 27, 1966
(Cl. D90—20)



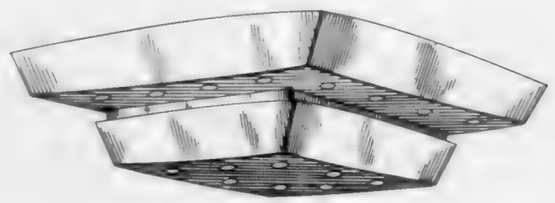
210,440
KNIFE
John W. Latham, London, England, assignor to Wilkinson Sword Limited, London, England, a British company
Filed Feb. 3, 1967, Ser. No. 5,685
Term of patent 14 years
(Cl. D95—3)



210,441
ELECTRIC SCISSORS
Henry Dreyfuss, South Pasadena, Calif., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed July 24, 1967, Ser. No. 7,956
Term of patent 14 years
(Cl. D95—5)



210,442
COMBINED SCOREBOARD AND SIGN
Jacques Y. Foster, Des Moines, and Theron E. McCullough, Altoona, Iowa, assignors to Fair-Play Mfg. Co., Des Moines, Iowa, a corporation of Iowa
Filed July 25, 1967, Ser. No. 7,976
Term of patent 14 years
(Cl. D96—12)



LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 5TH DAY OF MARCH, 1968

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Albrecht, Robert J.: *See*—
Griner, Arthur J., and Albrecht. Re. 26,357.
Becka, Michael M.: *See*—
Kamborian, Jacob S., Becka, and Dunlap. Re. 26,355.
Chevron Research Co.: *See*—
White, Robert J. Re. 26,358.
Dunlap, Robert B.: *See*—
Kamborian, Jacob S., Becka, and Dunlap. Re. 26,355.
Ferro Stamping Co.: *See*—
Pickles, Joseph. Re. 26,356.
Griner, Arthur J., and R. J. Albrecht, to National Biscuit Co. Metering apparatus. Re. 26,357, 3–5–68, Cl. 53—26.
Kamborian, Jacob S., M. M. Becka, and R. B. Dunlap; said Becka and said Dunlap, assors. to said Kamborian. Lasting machine having cooled clamp. Re. 26,355, 3–5–68, Cl. 12—10.5.
National Biscuit Co.: *See*—
Griner, Arthur J., and Albrecht, Re. 26,357.
Pagano, Ralph R. Wearing apparel with body-conforming inner panel. Re. 26,360, 3–5–68, Cl. 128—519.
Pickles, Joseph, to Ferro Stamping Co. Window lift gear. Re. 26,356, 3–5–68, Cl. 74—411.
Thompson, Fred. Truck unloading structure. Re. 26,359, 3–5–68, Cl. 214—83.2.
White, Robert J., to Chevron Research Co. Single-stage hydrocracking process with a nitrogen containing feed stock. Re. 26,358, 3–5–68, Cl. 208—111.

Borg-Warner Corp.: *See*—
Crouch, Richard O., and Townsend. 3,371,796.
Epstein, Herman, Harris, Johnson, and Thourson. 3,372,-400.
Pettyjohn, Austin E., Riblett, Davidson, and Cox. 3,371,-615.
Raver, Francis M., and Markley. 3,371,505.
Börner, Manfred, and H. Schüssler, to Telefunken Patentverwertungs-G.m.b.H. Mechanically strong mechanical resonant filter having weak coupling between resonators. 3,372,351, 3-5-68, Cl. 333—71.
Boscaino, Lorenzo: *See*—
McNeal, Daniel R., Jr., and Boscaino. 3,371,545.
Bouyoucos, John V., to General Dynamics Corp. Acoustic apparatus. 3,371,726, 3-5-68, Cl. 173—134.
Boving and Co., Ltd.: *See*—
Stephenson, James W. 3,371,683.
Bowditch, Hoel L., and P. H. Sanford, to The Foxboro Co. Force balance apparatus. 3,371,862, 3-5-68, Cl. 235—200.
Bowers, William E., to Schlumberger Technology Corp. Method and apparatus for forming armored cables. 3,371,474, 3-5-68, Cl. 57—15.
Bowman, Edward W. Rapid cooling system for glass annealing lehrs. 3,371,430, 3-5-68, Cl. 34—217.
Bowman, Francis, A. C. Cooper, and F. Irving, to Imperial Chemical Industries Ltd. Process for coloring synthetic linear polyesters. 3,372,138, 3-5-68, Cl. 260—40.
Bowman, Robert J., and D. F. Wesolowski, to Square D Co. Tamper-proof key-operated electric control station. 3,372,-251, 3-5-68, Cl. 200—44.
Bowsher, Edward A. H., and K. G. Perkins, to Plessey-U K Ltd. Pulse signal demodulator with judgement level producing and comparison means. 3,372,234, 3-5-68, Cl. 178—88.
Boyd, James R., A. H. Mones, and J. C. Schottmiller, to International Business Machines Corp. Electrical device, method and material. 3,372,058, 3-5-68, Cl. 117—227.
Boyers, John S., R. C. Curtis, R. H. Sherman, Jr., and R. R. Crowley, to Dictaphone Corp. Time indicating recording and reproducing apparatus. 3,372,240, 3-5-68, Cl. 179—100.2.
Boylston Research Associates: *See*—
Horley, Donald W., and Korb. 3,372,272.
Boyne Products, Inc.: *See*—
Stol, Walter T., and Thompson. 3,372,252.
Boyum, Mardell L., and P. F. Grinnell, to E. I. du Pont de Nemours and Co. Web winding apparatus. 3,372,320, 3-5-68, Cl. 318—7.
Bozek, John S., to Continental Can Co. Plastic tab and inner tape for easy opening can end. 3,371,818, 3-5-68, Cl. 220—54.
Bozsvai, Alex, to The Ohio Crankshaft Co. Bearing structure for a vertical motor-generator unit. 3,371,971, 3-5-68, Cl. 308—187.
Braccini, Alfonso A., to Whittaker Corp. Cantilevered petal-beam parabolic antenna reflector. 3,372,396, 3-5-68, Cl. 343—916.
Brader, Stanley F., Sr., C. L. Kuhn, and O. F. Snow, to Lockheed Aircraft Corp. Loading, conveying and ejecting mechanism for aircraft. 3,371,891, 3-5-68, Cl. 244—137.
Bradley, William A.: *See*—
Lytle, Chester W., Bradley, and Suhrke. 3,372,291.
Bramer, Donald W., L. Brockman, H. C. Sibley, and J. A. Snell, to General Signal Corp. Journal temperature information recording system for trains. 3,372,267, 3-5-68, Cl. 235—92.
Bressler, Martin, to Aerojet-General Corp. Color coding optical reticle. 3,372,282, 3-5-68, Cl. 250—236.
Briggs, Evan V.: *See*—
Samler, Lee F., and Briggs. 3,371,912.
Brigham, Ward E., to Sun Chemical Corp. Interchangeable inking unit for multi-color presses. 3,371,603, 3-5-68, Cl. 101—175.
Brindley, Claude S. Heat exchanger for air conditioner. 3,371,-504, 3-5-68, Cl. 62—324.
Bristol-Myers Co.: *See*—
Granatek, Edmund S. 3,372,177.

Fahrni, Fred : *See*—
Faerels, Franciscus, and Hostettler. 3,372,217.

Fairbanks, Henry N., and D. H. Robbins, to Itek Corp. Cassette. 3,371,884, 3–5–68, Cl. 242—71.1.

Falckenberg, Otto F. Portable bowling ball cleaner. 3,371,365, 3–5–68, Cl. 15—97.

Fan, John C. : *See*—
O'Keefe, Michael F., and Fan. 3,372,364.

Fann, James D. Filter press. 3,371,786, 3–5–68, Cl. 210—90.

Fanselow, John R., to Engelhard Minerals & Chemicals Corp. Spray dried clay product and method for producing the same. 3,372,043, 3–5–68, Cl. 106—72.

Farbenfabriken Bayer Aktiengesellschaft : *See*—
Dietzel, Karl, and Veiel. 3,372,357.
Dittmar, Gerhard, and Scholl. 3,372,155.

Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning : *See*—
Buchalla, Artur, and Uschkoreit. 3,371,597.
Remy, Hermann. 3,372,170.
Remy, Hermann. 3,372,171.
Winkelmann, Erhardt, Wagner, and Schorr. 3,372,172.

Fargo, Mfg., Co. : *See*—
Wengen, Henry R. 3,372,361.

Farina, Frank J., Jr., to Mueller Brass Co. Liquid indicator. 3,371,648, 3–5–68, Cl. 116—117.

Farmer Bros. Co. : *See*—
Price, Gail A. 3,371,593.

Farnworth, Ivan A. Valve structure. 3,371,967, 3–5–68, Cl. 303—69.

Farquhar, James T. : *See*—
Vessey, Clifford A., and Farquhar. 3,371,987.

Farrel Corp. : *See*—
Board, Samuel S., Jr., Gagliardi, and Hold. 3,371,450.

Fasola, Henry, to California Computer Products, Inc. Adaptor mechanism for light circuits. 3,372,302, 3–5–68, Cl. 315—272.

Fastron Co., The : *See*—
Cochrum, William A. 3,372,366.

Fathauer, George H., to Radson Engineering Corp. Load cell. 3,371,526, 3–5–68, Cl. 73—141.

Fattore, Vittorio : *See*—
Vecchio, Martino, Fattore, and Cammarata. 3,372,126.

Faulkner, Robert W. : *See*—
Auld, David B., Faulkner, and Lowery. 3,372,281.

Fausti, Fulcieri, and A. Morando, to Pirelli S.p.A. Process for manufacturing rubber strips to be used in pneumatic tires. 3,372,078, 3–5–68, Cl. 156—306.

Fecher, Donald J., and R. A. Price, to Bendix Corp. Steerable landing skid. 3,371,889, 3–5–68, Cl. 244—50.

Federal Pacific Electric Co. : *See*—
Engel, Edward I. 3,371,746.

Felt, James H., to Motorola, Inc. Oscillator having piezoelectric elements operating at different harmonic modes. 3,372,348, 3–5–68, Cl. 331—116.

Feldman, Allan M. : *See*—
Hoffmann, Arthur Kentaro, Abraham, and Feldman. 3,372,182.

Felix, Ernst, to Zellweger Ltd. Method and apparatus for checking knots. 3,371,568, 3–5–68, Cl. 83—13.

Felix, Pierre, to Societe Rhodiaceta. Manufacture of textile products in the form of threads, cords, ropes and other similar articles from films of oriented synthetic linear polymeric material. 3,371,477, 3–5–68, Cl. 57—157.

Fellner, Phillip J., and E. S. Micklewicz, to Sturtevant Industries, Inc. Automatic label applying machine. 3,372,079. 3–5–68, Cl. 156—360.

Felton & Guilleaume Carlswerk Aktiengesellschaft : *See*—
Zielasko, Horst. 3,372,355.

Fenoglio, Charles E., and M. A. Koltuniak, to The Udylite Corp. Calibrated bypass conductor current measuring system. 3,372,334, 3–5–68, Cl. 324—126.

Ferguson, Charles W. : *See*—
Rahrig, Donald D., O'Connell, and Ferguson. 3,372,016.

Fertig, Joseph, E. D. Mazzarella, and M. Skoultchi, to National Starch and Chemical Corp. Process for preparing salts of aminoalkyl esters of carboxylic acid polymers. 3,372,149, 3–5–68, Cl. 260—78.4.

Feser, Edward J. Dishwashing apparatus. 3,371,370, 3–5–68, Cl. 401—46.

Feyling, Per L. F. : *See*—
Weyand, John E., Bush, and Feyling. 3,371,792.

Fichtner, Roland H., to Dominion Electrohome Industries Ltd. Stereophonic decoders for F.M. receivers. 3,372,238, 3–5–68, Cl. 179—15.

Ficken, Geoffrey E., to Ilford Ltd. Cyanine dyes. 3,372,160, 3–5–68, Cl. 260—240.1.

Filliung, Jacques J., to Sloan Valve Co. Door controlled automatic flushing system. 3,371,353, 3–5–68, Cl. 4—99.

Filters, Inc. : *See*—
Cutler, Mac C. 3,372,073.

Fink, Roger H., and F. Z. Fouse, to Anchor Hocking Glass Corp. Container rim dip inspection apparatus. 3,371,421, 3–5–68, Cl. 33—174.

Firestone Tire & Rubber Co., The : *See*—

Liebchen, Waldemar. 3,371,688.
Gutman, Arnold D., and T. L. Snell, to Stauffer Chemical Co. O,O - diloweralkylphosphorodithiomethyl-(poly)chlorophenoxyacetates. 3,372,210, 3–5–68, Cl. 260—951.
Guyeska, John C., to Reliance Electric and Engineering Co. Induction motor slip frequency control system. 3,372,323. 3–5–68, Cl. 318—230.
Gwyn, Childress B., Jr., to Talon, Inc. Method and apparatus for forming composite electrical contact elements. 3,371,414. 3–5–68, Cl. 29—630.
Haack, Erich, R. Heerdt, K. Stach, and F. H. Schmidt, to C. F. Boehringer & Soehne G.m.b.H. Benzenesulfonyl semicarbazides. 3,372,164, 3–5–68, Cl. 260—292.
Haas, Roger E.: *See*—
Silene, Harold B., and Haas. 3,371,851.
Hachtman, Samuel J., to Sugarless Candy Corp. of America. Confection manufacture. 3,371,626, 3–5–68, Cl. 107—19.
Hackett, Kenneth R., to Ball Bros. Research Corp. Multiplex communication system wherein a redundant bit of one signal is produced and replaced by a bit of another signal. 3,372,237, 3–5–68, Cl. 179—15.
Hafler, David. Transistor amplifier protective circuit. 3,372,344, 3–5–68, Cl. 330—17.
Hagenbach, Gerard F., and D. Cheng, to Union Carbide Corp. Cryosorption vacuum pumping system. 3,371,499, 3–5–68, Cl. 62—55.5.
Hager, Robert R., to The Bendix Corp. Brake pedal mounting means. 3,371,486, 3–5–68, Cl. 60—54.5.
Hainey, Joseph J., to Winthrop-Atkins Co., Inc. Tray-like container. 3,371,843, 3–5–68, Cl. 229—34.
Hajos, Jozsef: *See*—
Heid, Jozsef, Hajos, and Seregi. 3,371,662.
Hale, Gordon B., and L. E. Granholm, to Outboard Marine Corp. Convertible top. 3,371,672, 3–5–68, Cl. 135—6.
Hall, Arnold M., to General Dynamics Corp. Controlled height aerodynamic and hydrodynamic baffles for air cushioned vehicles. 3,371,737, 3–5–68, Cl. 180—117.
Hall, Lloyd E., to Beckman Instruments, Inc. Composite housing for electrical devices. 3,372,360, 3–5–68, Cl. 338—143.
Hall, Mitchell A. Coin chute antitheft device. 3,371,763, 3–5–68, Cl. 194—97.
Haller, Richard. Transmissions for converting rotary into linear motion. 3,371,550, 3–5–68, Cl. 74—424.8.
Hallstein, Robert S.: *See*—
Banks, Howard E., Hartman, and Hallstein. 3,371,419.
Hamm, Douglas W., and K. J. Nisper, to Muskegon Piston Ring Co. Piston rings. 3,371,938, 3–5–68, Cl. 277—200.
Hanami, Yuiti, to Kurita Industrial Co., Ltd. Method of dehydrating sludge. 3,371,785, 3–5–68, Cl. 210—65.
Hanff, Michel: *See*—
Cecchini, Andre, Hanff, and Juhel. 3,372,369.

Ruff, Charles E., Gomez, and Jackson. 3,371,447.

Jackson, Robert E., and E. S. Prichard. Engine power takeoff drive. 3,371,543. 3–5–68, Cl. 74—15.4.

Jacobs, Arthur F., to Prudential Lighting Corp. Unitary double-detent connector for lighting fixtures. 3,371,900, 3–5–68, Cl. 248—343.

Jacobsen, Ronald R.: *See*—
Orlando, Anthony W., Jacobsen, Nutter, and Popp. 3,371,882.

Jacobson, Kurt I., to The Pavelle Corp. Method of shortening the processing time of color photography. 3,372,030, 3–5–68, Cl. 96—55.

Jacobson, William P.: *See*—
Ward, Frank A., and Jacobson. 3,371,848.

Jaecklin, Andre A., to Ampex Corp. Attenuation control device. 3,372,283. 3–5–68, Cl. 307—83.

Jaeger, Walter J., and C. G. Jones, to The National Cash Register Co. Automatic tracking control apparatus for maintaining alignment of a moving web. 3,371,916, 3–5–68, Cl. 226—17.

James, Cullen E., to Newton Insert Co. Threaded elements with locking keys. 3,371,697, 3–5–68, Cl. 151—23.

Jamison, Harry, and R. M. Verni, to The Jamison Plastic Corp. Attache cases and the like containers. 3,371,757, 3–5–68, Cl. 190—49.

Jamison Plastic Corp., The: *See*—
Jamison, Harry, and Verni. 3,371,757.

Jansen, Johan W., and H. Hoffmann. Electric hammer drill attachment. 3,371,725, 3–5–68, Cl. 173—123.

Jaszka, Daniel J., and J. T. Rucker, to Hooker Chemical Corp. Phosphonitrilic chloride purification process. 3,372,005, 3–5–68, Cl. 23—357.

Jensen, Finn: *See*—
Smith, Edward P., and Jensen. 3,371,969.

Jensen, Merlin R., to Electric Machinery Mfg. Co. Toggle operated electric vacuum switch. 3,372,353, 3–5–68, Cl. 335—26.

Johnen, Nicholas L. Strap stretching tool. 3,371,910, 3–5–68, Cl. 254—79.

Johnson, Arthur F. Aluminum reduction cell and insulation material therefor. 3,372,105, 3–5–68, Cl. 204—243.

Johnson, Edward M.: *See*—
Epstein, Herman, Harris, Johnson, and Thourson. 3,372,400.

Johnson, Francis, to The Dow Chemical Co. Isomerization of disubstituted cyclohexanones. 3,372,197, 3–5–68, Cl. 260—586.

Johnson, Glenn D.: *See*—
Lockwood, George H., Johnson, Robillard, and Hirv. 3,372,322.

Johnson, John A. Shock absorbing apparatus. 3,371,899, 3–5–68, Cl. 248—119.

Johnson & Johnson: *See*—
Johnson, Robert W. 3,371,668.
Morse, Edward A. 3,371,667.

Johnson, Lloyd D., to Telco Corp. Tool holder. 3,371,364, 3–5–68, Cl. 10—129.

Johnson, Oscar W., to Dorr-Oliver Inc. Manifolded hydrocyclone unit. 3,371,794, 3–5–68, Cl. 210—512.

Johnson, Robert G.: *See*—
Engh, Robert O., and Johnson. 3,372,279.

Johnson, Robert W., to Johnson & Johnson. Sanitary napkin. 3,371,668, 3–5–68, Cl. 128—290.

Johnson, Sigurd W., and M. A. Leedom, to Radio Corp. of America. Fluid applicator apparatus. 3,371,651, 3–5–68, Cl. 118—637.

Johnson, Stuart J., to Barber-Colman Co. Cutter for milling gears and the like. 3,371,396, 3–5–68, Cl. 29—103.

Jones, Chester G.: *See*—
Jaeger, Walter J., and Jones. 3,371,916.

Jones, Earle D., and A. Macovski, to Monsanto Co. Frequency synthesizer employing minimal number of driving frequencies. 3,372,347, 3–5–68, Cl. 331—39.

Jones, Frederick W. C., and E. W. Goodspeed, to Hooker Chemical Corp. Cold forming lubricant. 3,372,117, 3–5–68, Cl. 252—42.1.

Jones, Robert R., and H. G. Pekar, to The Lubrizol Corp. Method for producing black coatings on metal surfaces. 3,372,064, 3–5–68, Cl. 148—6.15.

Jones, Robert W.: *See*—
Keegan, Robert M., and Jones. 3,371,702.

Jones, Stanley B. Doughnut dropper with adjustable sizing means. 3,371,625, 3–5–68, Cl. 107—14.

Jones, Thurman R., Jr.: *See*—
Bennie, David G., and Jones. 3,372,218.

Jordan, John W. N., and J. J. Chierchiaro, to J. G. Furniture Co., Inc. Chair-tablet arm construction. 3,371,956, 3–5–68, Cl. 297—162.

Jordan, Merrill E., and J. F. Hardy, to Cabot Corp. Process for making high structure conductive carbon black. 3,371,997, 3–5–68, Cl. 23—209.4.

Joy, William M. Trim control device for boats. 3,371,642, 3–5–68, Cl. 114—66.5.

Jucker, Ernst, A. Ebnother, and A. Stoll, to Sandoz Ltd. 10,10 - lower alkyl - 9 - [1 - lower alkyl - pyrrolidines (3)]-9,10-dihydro-anthracenes and 9-hydroxy derivatives thereof. 3,372,168, 3–5–68, Cl. 260—326.5.

Juhel, Pierre: *See*—
Cecchini, Andre, Hanff and Juhel. 3,372,369.

Julow, Thomas M., to The Bendix Corp. Pedal and button actuated brake systems. 3,371,484, 3–5–68, Cl. 60—54.5.

Kabot, Warren D.: *See*—
Ryan, John W., and Kabot. 3,371,927.

Kaercher, William C., Jr., to Gamma, Inc. Conduit embedding machine. 3,371,495, 3–5–68, Cl. 61—72.7.

Kalle Aktiengesellschaft: *See*—
Schwarzer, Franz, and Macholdt. 3,372,156.

Kanai, Kazumichi: *See*—
Otsuka, Eiji, Kanai, and Chikaoka. 3,372,189.

Kane Air Scale Co.: *See*—
Stein Donald E. 3,371,732.

Kantor, Misha, to Radiation Inc. Universal modular packages for integrated circuits. 3,372,310, 3–5–68, Cl. 317—101.

Karnofsky, George B., to Blaw-Knox Co. Method of manufacturing vinyl acetate. 3,372,187, 3–5–68, Cl. 260—498.

Kasamatsu, Toshio: *See*—
Nishiyama, Atsushi, and Kasamatsu. 3,372,213.

Käser, Alfred, to Aktiengesellschaft Brown, Boveri & Cie. Device for accurate guiding of drilling tools in drilling machines. 3,371,560, 3–5–68, Cl. 77—62.

Katzer, Melvin F., to The Dow Chemical Co. Reducing the pressure on aqueous solutions of polymers. 3,371,714, 3–5–68, Cl. 166—42.

Kaufman, Irving, to TRW, Inc. Electronically steerable antenna system utilizing controllable dipolar resonant plasma column. 3,372,394, 3–5–68, Cl. 343—754.

Kaufmann, Harold: *See*—
Achler, Howard S., and Kaufmann. 3,371,513.

Kaufmann Tool & Engineering Corp.: *See*—
Achler, Howard S., and Kaufmann. 3,371,513.

Kawahashi, Takeshi, and H. Shiki, to Nippon Electric Co. Ltd. Arrangement for compensating amplitude and phase distortion of an electric signal. 3,372,350, 3–5–68, Cl. 333—28.

Kawamura, Michio, K. Ueda, Y. Ikegami, and K. Abe, to Fuji Shashin Film Kabushiki Kaisha. Treatment machine for heat treatment of sensitive material. 3,371,915, 3–5–68, Cl. 263—6.

Kearney, A. T., Personnel Services: *See*—
Macomber, Franklin S. 3,371,815.

Keegan, Robert M., and R. W. Jones, to Aladdin Mfg. Co., Inc. Storm window construction means. 3,371,702, 3–5–68, Cl. 160—392.

Kehler, Paul. Fully tracked vehicle. 3,371,733, 3–5–68, Cl. 180—6.7.

Kelley, Benjamin F. Grapple. 3,371,562, 3–5–68, Cl. 81—54.

Kelly, Joseph P., and G. H. Fuller, to Colgate-Palmolive Co. Air freshner. 3,371,984, 3–5–68, Cl. 21—53.

Kelsey-Hayes Co.: *See*—
Schutte, Daniel A., Nafs, and Carlisle. 3,371,750.

Kemex Mfg. Corp.: *See*—
Galletta, Josef. 3,371,587.

Keough, William R., 45% to Multifastener Co. Method for heat treating articles. 3,372,065, 3–5–68, Cl. 148—13.

Keyes, Marion A., to Beloit Corp. Device for continuously measuring porosity. 3,371,518, 3–5–68, Cl. 73—38.

Khrjapchenkov, Alexei S.: *See*—
Nikolaev, Arkady F., Malekhanov, Solovjev, Khrjapenenkov, Vologdin, Banige, Smirnov, and Bootaev. 3,371,586.

Kieber, Robert J.: *See*—
Gold, William, and Kieber. 3,372,094.

Kiene, William J. Pressure indicator. 3,371,537, 3–5–68, Cl. 73—395.

Kieninger, Richard, to Perpetuum-Ebner Fabrik Fuer Feinmechanik und Elektrotechnik Steidinger & Co. Kom. Ges. Stacking arbor for automatic record changers. 3,371,935, 3–5–68, Cl. 274—10.

Kikuchi, Yoshiyasu, to Nippon Electric Co. Ltd. Electric signal delay circuit. 3,372,385, 3–5–68, Cl. 340—174.

Kimberly-Clark Corp.: *See*—
Weber, Robert E. 3,372,044.

King, John O., Jr. Locking bolt and locking means therefor. 3,371,572, 3–5–68, Cl. 85—7.

King-Seeley Thermos Co.: *See*—
Olson, Eugene E., and Mickelson. 3,371,449.

Kinzelman, Gerald W., to United States of America, Army. Failsafe fuze setting system. 3,371,579, 3–5–68, Cl. 89—6.

Kirkham, Arthur J. Tents and methods of erection. 3,371,671, 3–5–68, Cl. 135—1.

Klein, Alfred. Electrode material for electrolytic processes. 3,372,107, 3–5–68, Cl. 204—291.

Klenke, Edward F., Jr.: *See*—
Linton, Howard R., and Klenke. 3,372,047.

Klibanoff, Allen L., to United States of America, Atomic Energy Commission. Method of producing porous hollow nickel bodies. 3,371,405, 3–5–68, Cl. 29—423.

Kline, Halsey W., to General Electric Co. VLF antenna. 3,372,395, 3–5–68, Cl. 343—787.

Klinger, Paul, to Kuratorium fur Verkehrssicherheit. Apparatus for the determination of the horizontal acceleration composed of different components in automotive vehicles. 3,372,386, 3–5–68, Cl. 340—262.

Klink, Jerome P., J. C. Belue, and J. H. Sears, to Owens-Corning Fiberglas Corp. Method for packaging multistrand roving. 3,371,877, 3–5–68, Cl. 242—18.

Klipov, Anatoly D.: *See*—
Astrov, Evgeny I., Klipov, Polushkine, and Routes. 3,371,704.

Klootwyk, Norman W., to S. H. Leggitt Co. Pump having combination check valve and shutoff valve. 3,371,617, 3–5–68, Cl. 103—178.

Klopfenstein, King L.: *See*—
Connors, Robert H., and Klopfenstein. 3,371,731.

Klopfenstein, King L., to Triangle Package Machinery Co. Wrapping machine. 3,371,466, 3–5–68, Cl. 53—206.

Knott, Leonard G. W., to F. Devetta (Electronics) Ltd. A.C. switch contacts. 3,372,303, 3–5–68, Cl. 317—11.

Knuepfer, Walter J., to International Telephone and Telegraph Corp. Waterproof push-button telephone sub set. 3,372,246, 3–5–68, Cl. 179—179.

Kobayashi Shinijiro: *See*—
Koizumi, Hiroyasu. 3,372,306.

Kocher, Leo F., to United States of America, Atomic Energy Commission. Neutron film dosimeter using multiple filters. 3,372,275, 3–5–68, Cl. 250—83.1.

Koda, Yutaka: *See*—
Kometani, Yutaka, Koda, Sugino, and Zumi. 3,372,082.

Koizumi, Hiroyasu, to Kobayashi Shinijiro. Proximity controlled automatic cigarette lighter and the like. 3,372,306, 3–5–68, Cl. 317—85.

Kolaczewski, Mitchell S.: *See*—
Pierson, Robert M., Hobson, Kolaczewski, and Rogers. 3,372,134.

Kollsman Instrument Corp.: *See*—
Tellerman, Jacob. 3,371,586.

Kollsman, Paul. Process of producing highly reactive compounds by metathesis. 3,372,101, 3–5–68, Cl. 204—180.

Kolomiets, Alexei F.: *See*—
Bliznjuk, Nickolai K., Kolomiets, and Zhemchuzhin. 3,372,211.

Koltuniak, Michael A.: *See*—
Fenoglio, Charles E., and Koltuniak. 3,372,334.

Kometani, Yutaka, Y. Koda, T. Sugino, and H. Zumi, to Daikin Kogyo Kabushiki Kaisha. Hollow filaments of a tetrafluoroethylene polymer and process for preparing them. 3,372,082, 3–5–68, Cl. 161—178.

Kometani, Yutaka, A. Yamada, and S. Satoyama, to Daikin Kogyo Kabushiki Kaisha. Dispersed tetrfluoroethylene-hexafluoropropylene copolymer based coating compositions. 3,372,136, 3–5–68, Cl. 260—33.8.

Koreki, Yoshiaki, and R. Kondo. Braiding machines. 3,371,573, 3–5–68, Cl. 87—37.

Konen, Jacob J., Jr., and M. K. Muir, to General Dynamics Corp. Information retrieval system. 3,372,383, 3–5–68, Cl. 340—173.

Koontz, Floyd A.: *See*—
Harrison, John E., Koontz, and Michaels. 3,372,339.

Koot, Nick: *See*—
Crooke, Robert C., Cooper, and Koot. 3,371,728.

Korb, Donald R.: *See*—
Horley, Donald W., and Korb. 3,372,272.

Korff, Wolfram G., to Western Engineering & Mfg. Co. Ventilator. 3,371,590, 3–5–68, Cl. 98—42.

Korver, Cornelis, to North American Philips Co., Inc. Metal reflector and method of manufacturing such reflectors. 3,372,008, 3–5–68, Cl. 29—183.5.

Kostal, Louis: *See*—
Nelson, Earle A., and Kostal. 3,371,924.

Kozowyk, Ted: *See*—
Sinclair, Alex H., and Kozowyk. 3,371,940.

Krainer, Helmut, and J. Maatsch, to Beteiligung und Patentverwaltungsgesellschaft mit beschrankter Haftung. Method of monitoring and controlling the oxygen blowing process. 3,372,023, 3–5–68, Cl. 75—60.

Krank, Wolfgang, and G. Mohring, to Telefunken-Patentverwertungs-G.m.b.H. Waveguide. 3,372,352, 3–5–68, Cl. 333—95.

Krantz, Karl W., to General Electric Co. Process for producing organopolysiloxanes. 3,372,133, 3–5–68, Cl. 260—28.

Kranz, Edmund J. Random mixing and dispensing amusement device. 3,371,932, 3–5–68, Cl. 273—144.

Krebaum, Lawrence J., to Monsanto Co. Production of hydrogen cyanide. 3,371,990, 3–5–68, Cl. 23—151.

Krepps, James E., to Sarkes Tarzian, Inc. Triode autodyne circuit. 3,372,340, 3–5–68, Cl. 325—440.

Krizman, John, Jr. Spark arrester. 3,371,472, 3–5–68, Cl. 55—399.

Krsek, George, O. Lowe, and J. Murray, to Rachelle Laboratories, Inc. Process for the preparation of tetracycline hydrochloride from tetracycline base. 3,372,190, 3–5–68, Cl. 260—559.

Kubota, Takashi, and S. Yamazaki, to Hitachi, Ltd. Radio communication receiver with standby control and warning circuit. 3,372,338, 3–5–68, Cl. 325—364.

Kubota, Yoshitaka: *See*—
Itoh, Shinya, Kubota, and Iizuka. 3,371,981.

Kudlaty, Walter J., to Marvel Engineering Co. Indicating by-pass assembly. 3,371,787, 3–5–68, Cl. 210—90.

Kudlaty, Walter J., R. N. Luchetta, and R. T. Sochor, to Marvel Engineering Co. Magnetic filter. 3,371,790, 3–5–68, Cl. 210—223.

Kugler, Artur: *See*—
Zaunberger, Franz X., and Kugler. 3,371,734.

Kuhn, Charles L.: *See*—
Brader, Stanley F., Sr., Kuhn, and Snow. 3,371,891.

Kuhn, Karl, to Societe d'Etudes de Machines Thermiques. Safety system for speed reversal in heat engines and the like. 3,371,655, 3–5–68, Cl. 123—41.

Kuipers, John J., to Westinghouse Air Brake Co. Overload protection for SCR motor control circuit. 3,372,304, 3–5–68, Cl. 317—33.

Kuratorium fur Verkehrssicherheit: *See*—
Klinger, Paul. 3,372,386.

Kurita Industrial Co., Ltd.: *See*—
Hanami, Yuiti. 3,371,785.

Kutner, Abraham, to Hercules, Inc. Process for improving the dyeability of polyolefins. 3,371,982, 3–5–68, Cl. 8—97.

Laboratory for Electronics, Inc.: *See*—
Fuller, Harrison W. 3,372,345.

La Fitte, Robert D.: *See*—
Wilson, William W., and La Fitte. 3,371,437.

Lagerstrom, Gunnar, to Atlas Copco Aktiebolag. Method and means of anchoring an object in the ground. 3,371,494, 3–5–68, Cl. 61—39.

Lagoon, Nicolas A.: *See*—
Harnett, Stanley E., and Lagoon. 3,372,091.

Lalande, John C. Apparatus for combustion control in diesel engines. 3,371,634, 3–5–68, Cl. 123—198.

Lallo, Matthew J. Safety radiator cap removal tool. 3,371,563, 3–5–68, Cl. 81—90.

Lamb, Noel E. Visual simulation. 3,371,432, 3–5–68, Cl. 35—12.

Lamb, Robert M. Pocket portable drinking cup. 3,371,695, 3–5–68, Cl. 150—.5.

Lammert, Charles R., to General Motors Corp. Transmission. 3,371,557, 3–5–68, Cl. 74—761.

Lancaster Motor Co.: *See*—
Anderson, Parker S. 3,371,532.

Landolt, Robert R., to United States of America, Atomic Energy Commission. Inert radioactive fission gas sampler. 3,372,274, 3–5–68, Cl. 250—83.

Lane, Leslie C., Jr., to American Cyanamid Co. Selective type bar and ink pad arrangement. 3,371,601, 3–5–68, Cl. 101—93.

Lang, Hermann: *See*—
Radebold, Reinhart, and Lang. 3,371,609.

Langston Co., The: *See*—
Moser, Henry W., and Grobman. 3,371,585.

La Plante, Dale E.: *See*—
Nairn, John L., and La Plante. 3,372,398.

Larrington, Albert N. Work scheduling apparatus. 3,371,438, 3–5–68, Cl. 40—124.

Larson, John D., to Varian Associates. Gyromagnetic spectrometer having a tapered dielectric transistion between a a coaxial line and a helix structure. 3,372,331, 3–5–68, Cl. 324—.5.

Larson, Robert W., J. W. Hood, and J. P. Lundberg, to Beloit Corp. Method for harvesting trees. 3,371,692, 3–5–68, Cl. 144—309.

Larsson, Ivar F. Camping trailer. 3,371,954, 3–5–68, Cl. 296—23.

Law, Russell R., to Hughes Aircraft Co. Television signal recorder. 3,372,228, 3–5–68, Cl. 178—5.4.

Leaming Plastics, Inc.: *See*—
Puente, Jose R. 3,371,922.

Leary, Robert E., L. J. Nehmsmann, III, L. M. Schenck, and J. M. Walts, to General Aniline & Film Corp. Alkoxylation of secondary alcohols. 3,372,201, 3–5–68, Cl. 260—615.

Le Blanc, Joseph A., Jr., to Precision Scientific Co. Multistage vacuum pump. 3,371,857, 3–5–68, Cl. 230—152.

Le Blanc, Joseph H., Jr., to Tapatco, Inc. Life vest and method of making same. 3,371,363, 3–5–68, Cl. 9—333.

Leedom, Marvin A.: *See*—
Johnson, Sigurd W., and Leedom. 3,371,651.

Leeds & Micallef: *See*—
Micallef, Lewis A. 3,371,627.

Leeper, James W., to Eaton Yale & Towne Inc. Brake adjuster. 3,371,755, 3–5–68, Cl. 188—196.

Leesona Corp.: *See*—
Forten, Jeremy. 3,372,061.

Lefevre, Lloyd E., and R. J. Mathieson, to The Dow Chemical Co. Process for preparing filamentary microtapes of labrinthian cross section. 3,372,221, 3–5–68, Cl. 264—285.

Lefevre, Lloyd E.: *See*—
Romesberg, Floyd E., Hart, and Lefevre. 3,372,222.

Rahrig, Donald D., O'Connell, and Ferguson. 3,372,016.

Licentia Patent-Verwaltungs-G.m.b.H.: *See*—
Radebold, Reinhart, and Lang. 3,371,609.
Steimel, Karl, and Heumann. 3,372,329.

Lich, Richard L.: *See*—
Cunningham, James B., and Lich. 3,371,748.

Lich, Richard L., to General Steel Industries, Inc. Articulated car. 3,371,622, 3–5–68, Cl. 105—4.

Liebchen, Waldemar, to J. Gusken. Double weft thread picking means for shuttleless looms. 3,371,688, 3–5–68, Cl. 139—123.

Lilly, Martin J., to Sun Chemical Corp. Coreless roll dispenser. 3,371,774, 3–5–68, Cl. 206—52.

Lilly, Martin J., to Sun Chemical Corp. Multiple article display package. 3,371,777, 3–5–68, Cl. 206—78.

Lindaman, Richard: *See*—
Cohn, Marius, and Lindaman. 3,372,377.

Linde Aktiengesellschaft: *See*—
Seidel, Max. 3,371,496.

Link-Belt Co.: *See*—
Lubold, Richard P. 3,371,906.

Linton, Howard R., and E. F. Klenke, Jr., to E. I. du Pont de Nemours and Co. Color stabilized mica. 3,372,047. 3–5–68, Cl. 106—291.

Lion Mfg. Corp.: *See*—
Isaacson, Joseph L. 3,371,762.

Lipsius, Harold B.: *See*—
Romano, Ralph. 3,371,700.

Litt, Morton H., and G. J. Schmitt, to Allied Chemical Corp. Epoxy resins from halogen-substituted, unsaturated alcohols. 3,372,152, 3–5–68, Cl. 260—91.3.

Little, John C., to The Dow Chemical Co. Reduction of nitriles to primary amines. 3,372,195, 3–5–68, Cl. 260—570.7.

Livshits, Abram L., and V. E. Polotsky. Hydrosolenoid unit for electroerosion machines. 3,372,202, 3–5–68, Cl. 219—69.

Lewing, Albert W., to Tampax Inc. Absorbent device. 3,371,666, 3–5–68, Cl. 128—285.

Loake, George A., to Southborough Group Ltd. Extension slide. 3,371,968, 3–5–68, Cl. 308—3.6.

Lobur, Walter, to Elox Corp. Balancing circuit for electrically controlled hydraulic servo systems. 3,372,311, 3–5–68, Cl. 317—123.

Locke, David R., R. B. Wuennemann, and R. J. Tolmie, to Sperry Rand Corp. Electric switch having a pair of contacts actuated by a cam means having a plurality of flat outer surfaces. 3,372,247, 3–5–68, Cl. 200—6.

Lockheed Aircraft Corp.: *See*—
Brader, Stanley F., Sr., Kuhn, and Snow. 3,371,891.
Schmidt, Jacob. 3,371,582.

Lockwood, George H., G. D. Johnson, E. G. Robillard, and H. E. Hirv, to The Heald Machine Co. Stepping motor feed for a grinder including a high speed slewing motor. 3,372,322, 3–5–68, Cl. 318—39.

Lok-Products Co.: *See*—
Sutter, Ormond S. 3,372,273.

Loma Industries, Inc.: *See*—
Benjamin, E. Burton. 3,371,356.

Long Mfg. Co., Inc.: *See*—
Atkinson, Wallace E. 3,371,511.

Loper, George B., to Mobil Oil Corp. System and method for reducing secondary pressure pulses in marine seismic surveying. 3,371,740. 3–5–68, Cl. 181—.5.

Lorraine Industries, Inc.: *See*—
Duncan, Golda A., and Aleson. 3,371,934.

Louks, Robert A., and V. H. Sietmann. Livestock automatic watering device. 3,371,652. 3–5–68, Cl. 119—51.11.

Louth, Noel, to John Bull Rubber Co. Ltd. Apparatus for manufacturing corrugated or convoluted hose. 3,371,381. 3–5–68, Cl. 18—19.

Lovercheck, Charles L.: *See*—
Hill, Teresa J., and Lovercheck. 3,371,660.

Low, John L., III. Form for concrete columns. 3,371,904. 3–5–68, Cl. 249—48.

Lowe, Edward J., and F. A. Ridgway, to Hooker Chemical Corp. Production of phosphine. 3,371,994. 3–5–68, Cl. 23—204.

Lowe, Orville: *See*—
Krsek, George, Lowe, and Murray. 3,372,190.

Lowery, Andrew: *See*—
Auld, David B., Lowery, and Penny. 3,372,280.
Auld, David B., Faulkner, and Lowery. 3,373,381.

Lubold, Richard P., to Link-Belt Co. Iris valve. 3,371,906. 3–5–68, Cl. 251—4.

Lubrizol Corp., The: *See*—
Coleman, Lester E. 3,372,120.
Jones, Robert R., and Pekar. 3,372,064.
McMillen, Richard L. 3,372,115.
Meinhardt, Norman A. 3,372,116.
Rense, Rudolph J. 3,372,114.
Rense, Rudolph J. 3,372,118.

Lucas, Joseph, (Industries) Ltd.: *See*—
Warne, Eugene H. 3,371,481.

Luchetta, Robert N.: *See*—
Kudlaty, Walter J., Luchetta, and Sochor. 3,371,790.

Lucien, Rene, and J. Masclet, to Recherches Etuder Production R.E.P. Segmented disc brake. 3,371,749, 3–5–68, Cl. 188—71.

Ludi & Cie, A.G.: *See*—
Ludi, Friedrich. 3,371,810.

Ludi, Friedrich, to Ludi & Cie. A.G. Test tube closure. 3,371,810, 3–5–68, Cl. 215—38.

Ludwig, Herbert. Injection apparatus with pressure regulation. 3,371,386, 3–5–68, Cl. 18—30.

Luhowy, Gabriel J.: *See*—
Bachman, Raymond E., and Luhowy. 3,372,336.

Lumoprint Zindler K.G.: *See*—
Elfers, Henry. 3,372,301.

Lundberg, John P.: *See*—
Larson, Robert W., Hood, and Lundberg. 3,371,692.

Lundgren, Knut: *See*—
Wikner, Per F., and Lundgren. 3,371,604.

Lundin, Curt F.: *See*—
Wikner, Per F., and Lundgren. 3,371,604.

Lynch, Donald L., and A. K. Zweede, to The Reliance Electric and Engineering Co. Liquid-cooled eddy current device. 3,372,292, 3,5–68, Cl. 310—105.

Lyskovtsov, Ivan V. Drum of disc bowl centrifuge for separating liquid mixture. 3,371,85[illegible], 3–5–68, Cl. 213—20.

Lytle, Chester W., W. A. Bradley, and R. V. Suhrke, to T. A. Banning, Jr. Motor drives for control rods of reactors, and the like. 3,372,291, 3–5–68, Cl. 310—49.

Maag Gear Wheel & Machine Co., Ltd. : *See*—
Muller, Karl. 3,371,422.

Maatsch, Jurgen : *See*—
Krainer, Helmut, and Maatsch. 3,372,023.

Mabey, Donald H., to Christensen Diamond Products Co. Diamond saw or milling blades. 3,371,452, 3–5–68, Cl. 51—206.

Macdonald, Ian P. L. : *See*—
Wikhammer, George A., Macdonald, and Collier. 3,372,093.

Macfarlane, Frank P., Jr., and B. I. Pesetsky, to Union Carbide Corp. Catalytic chromium plating process employing bis(arene)chromium. 3,372,055, 3–5–68, Cl. 117—107.2.

Macholdt, Hans : *See*—
Schwarzer, Franz, and Macholdt. 3,372,156.

Mack Trucks, Inc. : *See*—
Soper, Guy E. 3,371,552.

Mackie, James & Sons Ltd. : *See*—
Hill, Moore. 3,371,879.

Macmillan, James A., to Sherritt Gordon Mines Ltd. Hydraulic hoisting of discrete solids. 3,371,965, 3–5–68, Cl. 302—14.

Macomber, Franklin S., to A. T. Kearney, Personnel Services. Freight binding device. 3,371,815, 3–5–68, Cl. 220—1.5.

Macorski, Albert : *See*—
Jones, Earle D., and Macovski. 3,372,347.

Mac Sorley, Olin L., and F. R. Bielawa, to International Business Machines Corp. Multiplier for simultaneously generating partial products of various bits of the multiplier. 3,372,269, 3–5–68, Cl. 235—164.

Madewell, Ray A. : *See*—
Holt, Charles R., and Madewell. 3,372,075.

Maeda, Osamu, to Toyo Bearing Mfg. Co. Sealing device for bearings. 3,371,937, 3–5–68, Cl. 277—189.

Maeda, Shozo, K. Ito, T. Nishida, T. Tamura, to Sumitomo Chemical Co., Ltd. Novel catalyst composition. 3,372,128, 3–5–68, Cl. 252—437.

Magic, John J., and R. F. Frost, to American Maize-Products Co. Starch compositions and improvements of food with same. 3,372,034, 3–5–68, Cl. 99—83.

Mairle, George F. : *See*—
Cordio, Anthony S., and Mairle. 3,371,385.

Majewski, Theodore E., to The Dow Chemical Co. Corrosion inhibitors. 3,372,124, 3–5–68, Cl. 252—77.

Makin, Earle C., Jr. : *See*—
Davis, George D., and Makin. 3,372,109.

Malekhanov, Evgeny I. : *See*—
Nikolaev, Arkady F., Malekhanov, Solovjev, Khrjapchenkov, Vologdin, and Banige. 3,371,586.

Malaikal, Joseph C., to Wisconsin Alumni Research Foundation. Orbitron vacuum pump with getter vaporization by resistance heating. 3,371,853, 3–5–68, Cl. 230—69.

Mandell, Joseph : *See*—
Hechtmann, Martin M., and Herbst. 3,371,842.

Mann, Charles G. : *See*—
Collom, Donald J., and Mann. 3,372,379.

Mannesmann Aktiengesellschaft : *See*—
Naeser, Gerhard, Wessel, and Darschewski. 3,372,113.

Marcey, Stephen D., to The National Cash Register Co. Method of dielectrically heat-molding epoxy resins. 3,372,214, 3–5–68, Cl. 264—25.

Marchione, Joseph H., to Atwood Vacuum Machine Co. Door hinge embodying torsion bar hold-open means. 3,371,374, 3–5–68, Cl. 16—145.

Marconi Co. Ltd., The : *See*—
Scarlett, John A. 3,372,324.

Marcus, Roy F., Jr., to The Trane Co. Refrigeration system starting. 3,371,500, 3–5–68, Cl. 62—117

Margen, Peter H. E., to Aktiebolaget Atomenergi. Nuclear reactor. 3,372,092, 3–5–68, Cl. 176—52.

Markley, William F. : *See*—
Raver, Francis M., and Markley. 3,371,505.

Marsh, William S., A. L. Garretson, and K. V. Rao, to Chas. Pfizer & Co., Inc. Streptonigrin antibiotics and process for their production. 3,372,090, 3–5–68, Cl. 167—65.

Martin, Perry S., to Egg-Vi-Tein Co. Dehydrating drum. 3,371,426, 3–5–68, Cl. 34—134.

Martiniak, Leonard J., to General Electric Co. Liquid level indicator for dispenser in dishwasher door. 3,371,535, 3–5–68, Cl. 73—306.

Marvel Engineering Co. : *See*—
Kudlaty, Walter J. 3,371,787.
Kudlaty, Walter J., Luchetta, and Sochor. 3,371,790.

Marzocchi, Alfred, to Owens-Corning Fiberglas Corp. Belts and other glass fiber-elastomeric structures and method of manufacture. 3,371,548, 3–5–68, Cl. 74—234.

Masclet, Jean : *See*—
Lucien, Rene, and Masclet. 3,371,749.

Masera, Arturo. Device for locking tracked vehicles, in particular excavators and the like. 3,371,735, 3–5–68, Cl. 180—9.62.

Mason, Arthur E., to The Associated Portland Cement Mfg. Ltd. Recorder with pivotally mounted chart transport unit. 3,372,399, 3–5–68, Cl. 346—49.

Massey-Ferguson Services N.V. : *See*—
Yapp, Robert E., and Metcalfe. 3,371,479.

Master Mechanics Co., The : *See*—
Evans, Robert M., and Briggs. 3,372,083.

Mathieson, Robert J. : *See*—
Lefevre, Lloyd E., and Mathieson. 3,372,221.

Mathis, Edmond. Rotary spade plow. 3,371,721, 3–5–68, Cl. 172—112.

Matovich, Edwin, to North American Aviation, Inc. Pressure-sensitive optical cell. 3,371,978, 3–5–68, Cl. 350—160.

Matsushita Electric Industrial Co., Ltd. : *See*—
Yamashita, Akio. 3,372,317.
Yoshida, Tomio, and Riko. 3,372,245.

Mattel, Inc. : *See*—
Ryan, John W., and Kabot. 3,371,927.

Maugue, Richard, to CSF-Compagnie Generale de Telegraphie. Doppler radar systems. 3,372,390, 3–5–68, Cl. 343—9.

Mayfield, Johnny W. Pipe cutting and beveling device. 3,371,565, 3–5–68, Cl. 82—4

Maynard, Robert N., B. R. Skipper, and N. Millman, to J. M. Huber Corp. Method of beneficiating clay by removal of titanium impurities. 3,371,988, 3–5–68, Cl. 23—110.

Mazurek, Robert C., and P. E. Hynson, to Armour Agricultural Chemical Co. Viscosity reduction of wet process superphosphoric acid. 3,372,002, 3–5–68, Cl. 23—293.

Mazzarella, Emil D. : *See*—
Fertig, Joseph, Mazzarella, and Skoultchi. 3,372,149.

McCabe, James M., to Coe Laboratories, Inc. Cabinet assembly. 3,371,977, 3–5–68, Cl. 312—257.

McCarthy, Daniel N., to Anchor Hocking Glass Corp. Coating process. 3,372,053, 3–5–68, Cl. 117—70.

McClellan, Ralph E., to Mellink Steel Safe Co. Insulated closure constructions and methods of assembly thereof. 3,371,628, 3–5–68, Cl. 109—59.

McCormick, Joseph F. : *See*—
Lesser, Marshall W., and McCormick. 3,372,371.

McCray, Harold E., and R. S. Hestand, to Cabot Corp. Integral crank and phased counterweight arm. 3,371,554, 3–5–68, Cl. 74—600.

McDearman, William D., Jr. : *See*—
Fly, Anderson B., and McDearman. 3,371,715.

McDonnell Douglas Corp. : *See*—
Barnes, Clair E., Hays, and Myers. 3,371,580.

McElroy, Arthur H. Apparatus and method for perforating beverage cases or the like. 3,371,544, 3–5–68, Cl. 74—86.

McGrath, Richard S., and N. W. Silcox, to International Business Machines Corp. Magnetic materials. 3,372,037, 3–5–68, Cl. 106—1.

McKnight, William H., to Corning Glass Works. Container closure. 3,371,811, 3–5–68, Cl. 215—39.

McMillen, Richard L., to The Lubrizol Corp. Basic metal-containing thickened oil compositions. 3,372,115, 3–5–68, Cl. 252—33.

McNeal, Daniel R., Jr., and L. Boscaino, to Andale Co. Valve operating equipment. 3,371,545, 3–5–68, Cl. 74—89.15.

McNeese, Leonard E. : *See*—
Richardson, Earl W., and McNeese. 3,372,004.

Mead Corp., The : *See*—
Arledter, Hanns F. 3,372,084.

Medallion Instruments, Inc. : *See*—
Carpenter, William R., and Passmore. 3,372,372.

Medlock Mfg. Co. Ltd. : *See*—
Cook, Alexander J. 3,371,957.

Mehal, Edward W. : *See*—
Bailey, Louis G., and Mehal. 3,372,069.

Meier, Ernst, to A. Teves. Hydraulic quick-slack-take-up pulsator for disc brakes. 3,371,753, 3–5–68, Cl. 188—152.

Mellink Steel Safe Co. : *See*—
McClellan, Ralph E. 3,371,628.

Meinhardt, Norman A., to The Lubrizol Corp. Preparation of basic metal phenates and salicylates. 3,372,116, 3–5–68, Cl. 252—36.

Mela, Richard L., to The Powermite Corp. Powered watercraft. 3,371,646, 3–5–68, Cl. 115—70.

Meltzer, Henry E. Cooling and carrying box for electric tools and appliances. 3,371,975, 3–5–68, Cl. 312—236.

Menegoz, Charles D., F. Damesin, and S. Socquet, to Pechiney Compagnie de Produits Chimiques et Electrometallurgiques. Electric arc reduction furnace and method. 3,372,223, 3–5–68, Cl. 13—9.

Menzel, Harry R. : *See*—
Dale, John R., and Menzel. 3,372,368.

Merck & Co., Inc. : *See*—
Engelhardt, Edward L. 3,372,196.

Merle, Jean, to Societe Grenobloise d'Etudes et d'Applications Hydrauliques. Braking device for moving bodies. 3,371,890, 3–5–68, Cl. 244—110.

Merrill, Claude E., to The Dow Chemical Co. Preparation of fluorine-guanidines and bi-guanides. 3,372,192, 3–5–68, Cl. 260—564.

Merryman, Jerry D., to Texas Instruments, Inc. Color display system. 3,372,298, 3–5–68, Cl. 315—14.

Metcalf, Eric, to Solartron Electronic Group Ltd. Suppression of transients at the outputs of transistor switching circuits. 3,372,287, 3–5–68, Cl. 307—240.

Metcalfe, Edward G. : *See*—
Yapp, Robert E., and Metcalfe. 3,371,479.

Meyer, Donald G., to Beckman Instruments, Inc. Tunnel diode binary output circuit. 3,372,289, 3–5–68, Cl. 307—286.

Meyer, Paul, and G. D. Humphreys. Centrifugal air classifiers. 3,371,782, 3–5–68, Cl. 209—144.

Meyer, Paul, and G. D. Humphreys. Centrifugal air classifiers. 3,371,783, 3–5–68, Cl. 209—144.

Micallef, Lewis A., to Leeds & Micallef. Captive closure for containers with turnable retractable spout. 3,371,827, 3–5–68, Cl. 222—507.

Michaels, Thomas B. : *See*—
Harrison, John E., Koontz, and Michaels. 3,372,339.

Michell, Peter R., and F. G. Packham, to Imperial Chemical Industries Ltd. Method and apparatus for electrical resistance measurement. 3,372,332, 3–5–68, Cl. 324—30.

Mickelson, Harold A. : *See*—
Olson, Eugene E., and Mickelson. 3,371,449.

Wallace, John F., and R. W. Newyear, to Vulcan Mold and Iron Co. Metallurgical process. 3,372,025, 3–5–68, Cl. 75—123.
Walther, Fritz. Safety mechanism for hand firearms. 3,371,441, 3–5–68, Cl. 42—70.
Walts, John M. : *See*—
Leary, Robert E., Nehmsmann, Schenck, and Walts. 3,372,201.
Wandscheer, Evert. Combined rotary and push type snow plow. 3,371,434, 3–5–68, Cl. 37—43.
Waplan, Thure, to Waplans Mekanisha Verkstads A.B. Bark press. 3,371,598, 3–5–68, Cl. 100—166.
Waplans Mekanisha Verkstads A.B. : *See*—
Waplan, Thure. 3,371,598.
Ward, Frank A., and W. P. Jacobson, to Anderson Bros. Mfg. Co. Reclosable package. 3,371,848, 3–5–68, Cl. 229—45.
Ward, Lyle O. Directional flow exhaust regulator. 3,371,645, 3–5–68, Cl. 115—5.
Ware, Frank. Fire-resistant cementitious plaster composition. 3,372,040, 3–5–68, Cl. 106—15.
Warne, Eugene H., to Joseph Lucas (Industries) Ltd. Fuel systems for gas turbine engines. 3,371,481, 3–5–68, Cl. 60—39.28.
Waters, Rolland M., and J. C. Smith, to Dow Chemical Co. Flame resistant epoxy resins containing phosphorus and a halogen. 3,372,208, 3–5–68, Cl. 260—830.
Watson, Wayne T. : *See*—
Arlin, Edward S., and Watson. 3,372,257.
Webb, George, to Avco Corp. Fuze with delay firing, and impact firing features. 3,371,608, 3–5–68, Cl. 102—72.
Weber, H. H., and Co., Inc. : *See*—
Benlinger, Robert L. 3,371,769.
Weber, Karl-Heinz, to Gebr. Eickhoff, Maschinenfabrik and Eisengiesserei m.b.H. Method and apparatus for scanning and monitoring the roof of seams mined by cutting machines. 3,371,964, 3–5–68, Cl. 299—1.
Weber, Robert E., to Kimberly-Clark Corp. Method and composition for forming paper having opaque cellular structure. 3,372,044, 3–5–68, Cl. 106—130.
Weber, Robert E. Paper coating composition and method of coating. 3,372,050, 3–5–68, Cl. 117—64.
Welbull, Nils R. M., to Ingenjorsfirman Mils Welbull AB. Method and apparatus for controlling the temperature in a room. 3,371,707, 3–5–68, Cl. 165—2.
Weinert, Lawrence E. : *See*—
Rehr, Henry W., Weinert, and Cole. 3,371,767.
Weingartner, Bernhard, to Akustische U. Kino-Gerate Gesellschaft m.b.H. High frequency circuit arrangement for capacitive transducer. 3,372,235, 3–5–68, Cl. 179—1.
Weissbein, Leonard, to American Cyanamid Co. Process for the color restoration of faded textile materials and articles produced thereby. 3,372,948, 3–5–68, Cl. 117—2.
Weisse, Rosemary E. : *See*—
Morison, Charles R. W., and Weisse. 3,372,035.
Weltzner, Dorothea M. Sound producing device. 3,371,933, 3–5–68, Cl. 274—1.
Weldes, Helmut H. W., and D. I. Netting, to Philadelphia Quartz Co. Silicate coatings. 3,372,038, 3–5–68, Cl. 106—1.
Welk, August G., to Welk Bros. Metal Products, Inc. Mobile bulk material handler. 3,371,939, 3–5–68, Cl. 280—5.
Welk Bros. Metal Products, Inc. : *See*—
Welk, August G. 3,371,939.
Weller, Forrest D., to Alton Box Board Co. Manufacture of furniture. 3,371,963, 3–5–68, Cl. 297—445.
Welti, Arno, to Albiswerk Zurich A.G. Apparatus and method for guiding a first travelling body relative to a second travelling body. 3,371,887, 3–5–68, Cl. 244—3.11.
Weltronic Co. : *See*—
Cullom, Donald J., and Mann. 3,372,379.
Wendell, Charles B., to Cabot Corp. Apparatus for producing metal oxides. 3,372,001, 3–5–68, Cl. 23—277.
Wengen, Henry R., to Fargo Mfg. Co. Cable connector. 3,372,361, 3–5–68, Cl. 339—97.
Wentz, Joachim : *See*—
Glaser, Fritz, and Wentz. 3,371,425.
Wesolowski, David F. : *See*—
Bowman, Robert J., and Wesolowski. 3,372,251.
Wessel, Otto : *See*—
Naeser, Gerhard, Wessel, and Darschewski. 3,372,113.
Western Electric Co., Inc. : *See*—
Budzich, Mieczyslaw, and Cunningham. 3,371,377.
Western Engineering & Mfg. Co. : *See*—
Korff, Wolfram G. 3,371,590.
Westfall, Paul M., N. R. Eldred, and J. C. Spicer, to Union Carbide Corp. Water-soluble polyalkylenepolyamine/urethane resins and application thereof in production of wet strength paper. 3,372,085, 3–5–68, Cl. 162—164.
Westfall, Paul M., N. R. Eldred, and J. C. Spicer, to Union Carbide Corp. Water-soluble polyalkylenepolyamine/dialdehyde resins and application thereof in production of wet strength paper. 3,372,086, 3–5–68, Cl. 162—164.
Westinghouse Air Brake Co. : *See*—
Blazek, Frank V., and Gilbert. 3,372,285.
Kuipers, John J. 3,372,304.
Westinghouse Electric Corp. : *See*—
Bellman, Brian M., Blas, and Moore. 3,372,388.
Weston, Roy F., Inc. : *See*—
Stack, Vernon T., Jr. 3,372,103.
Weyand, John E., J. H. Bush, and P. L. F. Feyling, to Millipore Filter Corp. Multiple filter plate units. 3,371,792, 3–5–68, Cl. 210—335.
White, Carol H., and W. I. Mitchell, to The International Nickel Co., Inc. Heat treatment for improving proof stress of nickel-chromium-cobalt alloys. 3,372,068, 3–5–68, Cl. 148—162.
White, Elmer O., to The National Acme Co. Milling apparatus. 3,371,581, 3–5–68, Cl. 90—15.
White, Joseph E. Vocabulary and spelling game device. 3,371,431, 3–5–68, Cl. 35—9.

Whitehall Electronics Corp. of the First Bank & Trust Building: *See*—
Pearson, Raymond H. 3,371,739.

Whitehurst, Joe R., to Ideal Industries, Inc. Slip drafting means and method for textile fibers. 3,371,389, 3–5–68, Cl. 19—259.

Whittaker Corp.: *See*—
Braccini, Alfonso A. 3,372,396.

Whittlesey, Julian H. Bipod camera support. 3,371,589, 3–5–68, Cl. 95—86.

Widegren, Lars H. Extensible jib, mast or the like. 3,371,801, 3–5–68, Cl. 212—55.

Wieland, Wolfgang: *See*—
Abood, Frederick J., Jr., and Wieland. 3,371,821.

Wieland, Michael, to Dynamit Nobel Aktiengesellschaft. Structural part made of plastic material. 3,371,457, 3–5–68, Cl. 52—404.

Wiener Maria V., to The Goodyear Tire & Rubber Co. Terephthalic acid-aliphatic acid copolyester resins. 3,372,148, 3–5–68, Cl. 260—75.

Wigington, Jerry, to The Singer Co. Sequential switching with delay for controlled rectifier circuits. 3,372,288, 3–5–68, Cl. 307—252.

Wikhammer, George A., I. P. L. Macdonald, and J. G. Collier. Apparatus for increasing the critical heat flux for high pressure steam/water flow in nuclear reactors. 3,372,093, 3–5–68, Cl. 176—54.

Wikner, Per F., and K. Lundgren, to C. F. Lundin, J. Hans-Udo, and S. Elbert. Blasting mat. 3,371,604, 3–5–68, Cl. 102—22.

Wilcox, Albert F., to General Electric Co. Coil winding machine. 3,371,876, 3–5–68, Cl. 242—9.

Wildhaber, Ernest. Gear-shaped cutter. 3,371,395. 3–5–68, Cl. 29—103.

Wilkinson, Samuel C. W., to Crane Packing Ltd. Method of forming a flexible bellows connection between axially spaced members. 3,372,076, 3–5–68, Cl. 156—190.

Williams, Charles K. Stove for sauna baths. 3,372,264, 3–5–68, Cl. 219—367.

Williams, Nathaniel C.: *See*—
Noschese, Rocco J., Sarazen and Williams. 3,372,308.

Williams, Paul R.: *See*—
Blatt, Leland F., and Williams. 3,371,925.

Willits, Samuel P, and W. L. Mohan, to Spartanics, Ltd. Web feed system providing an auxiliary correcting feed movement. 3,371,834, 3–5–68, Cl. 226—27.

Willsea, Jasper, deceased; N. J. Willsea, executrix. Coordinated mechanism. 3,371,760, 3–5–68, Cl. 192—142.

Willsea, Norma J.: *See*—
Willsea, Jasper, 3,371,760.

Wilson, David S.: *See*—
Rhea, Hal H., and Wilson. 3,371,501.

Wilson, Gordon K., to Carter Precision Electric Co. Coordinated control for variable resistors. 3,372,359, 3–5–68, Cl 338—128.

Wilson, William W., and R. D. La Fitte, to Mid-Continent Steel Casting Corp. Locking device for digger tooth. 3,371,437, 3–5–68, Cl. 37—142.

Wimber, Ray T.: *See*—
Pearsall, Cortland S., and Wimber. 3,372,297.

Wimberley, Jerry W., to Continental Oil Co. Removal of impurities from alcohols by extraction with sugar. 3,372,203, 3–5–68, Cl. 260—643.

Windmoller & Holscher: *See*—
Rochia, Kurt. 3,371,849.

Winkelmann, Erhardt, W.-H. Wagner, and M. Schorr, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Preparation of 2,5-diacylamino-3,6-diamino-1,4-benzoquinones. 3,372,172, 3–5–68, Cl. 260—396.

Winthrop-Atkins Co., Inc.: *See*—
Hainey, Joseph J. 3,371,843.

Wipf, Edouard L., to Anstalt fur Patentankauf. Hinged aerosol actuator elements for sanitary flush bowl. 3,371,355. 3–5–68, Cl. 4—222.

Wisconsin Alumni Research Foundation: *See*—
Herb, Raymond G. 3,371,854.
Mallakal, Joseph C. 3,371,853.

Wise, Boyd A.: *See*—
Ogden, Larry M., and Wise. 3,371,611.

Wise, Edgar W.: *See*—
Turner, Andrew, and Wise. 3,372,153.
Turner, Andrew, and Wise. 3,372,154.

Wise, Ralph H. Windshield wiper. 3,371,369, 3–5–68, Cl. 15—250.42.

Wishnie, Frederick T., and D. P. Tanzman, to Eutectic Welding Alloys Corp. Method of flame spraying and powder. 3,372,054, 3–5–68, Cl. 117—105.2.

Wisman, Emery C., and J. H. Abernathy, Jr., to Texas Instruments Inc. Method of forming a small area junction semiconductor. 3,372,071, 3–5–68, Cl. 148—187.

Withem, Donald D. Circuit breaker for ignition systems. 3,372,249, 3–5–68, Cl. 200—19.

Witt, Donald R., to Phillips Petroleum Co. Stabilized olefin polymers. 3,372,140, 3–5–68, Cl. 260—45.9.

Wittek Mfg. Co.: *See*—
Rueckheim, Walter. 3,371,392.

Wloszek, Joseph T. Apparatus for positioning a search unit. 3,371,524, 3–5–68, Cl. 73—67.8.

Wohlfart, Kurt: *See*—
Remy, Hermann, and Wohlfart. 3,371,592.

Wolski, Bernard V.: *See*—
Piscitello, Robert A., Petit, and Wolski. 3,372,330.

Wood, George A., Jr.: *See*—
Hutton, William C., Allport, and Wood. 3,371,512.

Woodall, James W. Paddle wheel boat. 3,371,637, 3–5–68, Cl. 114—58.

Woolley, William J., to Henry Pratt Co. Sluice gate with inflatable rubber seal. 3,371,493, 3–5–68, Cl. 61—28.

Woolman, Granville: *See*—
Brownell, Roy D., and Woolman. 3,371,799.

Wright, John C., to Columbiana Inc. Hot top and composition thereof. 3,372,042, 3–5–68, Cl. 106—38.3.

Wright, Lawrence W.: *See*—
Thomas, Paul M., Wright, Burge, and Crile. 3,371,459.

Wu, Tse C., to General Electric Co. Aryl-vinyl containing linear disiloxanes and tri- and tetra-cyclosiloxanes. 3,372,178. 3–5–68, Cl. 260—448.2.

Wuennemann, Ronald B.: *See*—
Locke, David R., Wuennemann, and Tolmie. 3,372,247.

Wurz, Albert, to Philco-Ford Corp. Temperature scanning apparatus. 3,372,230, 3–5–68, Cl. 178—6.8.

Wyka, Edward W. Vaporizer device. 3,371,985, 3–5–68, Cl. 21—91.

Wyrick, Charles T.: *See*—
Dormer, Keith H., and Wyrick. 3,372,284.

Xerox Corp.: *See*—
Gundlach, Robert W., and Augustini. 3,372,027.

Yamada, Akira: *See*—
Kometani, Yutaka, Yamada, and Satoyama. 3,372,136.

Yamada, Makoto: *See*—
Terada, Hiroshi, Ishii, and Terada. 3,372,143.

Yamase, Hideo, to Shin Nippon Chisso Hiryo Kabushiki Kaisha. Apparatus and method for producing silicon single crystals for semiconductor. 3,372,003, 3–5–68, Cl. 23—301.

Yamashita, Akio, to Matsushita Electric Industrial Co., Ltd. Photoelectric device. 3,372,317, 3–5–68, Cl. 317—235.

Yamazaki, Seishi: *See*—
Kubota, Takushi, and Yamazaki. 3,372,338.

Yapp, Robert E., and E. G. Metcalfe, to Massey-Ferguson Services N. V. Hydrostatic transmission and control therefor. 3,371,479, 3–5–68, Cl. 60—19.

Yarrow and Co.: *See*—
Hartnell-Beavis, Michael C. 3,371,894.
Neyer, Robert D. 3,371,539.

Yatera, Shinzaburo. Autofocus enlarger. 3,371,577.

Yawata Iron & Steel Co., Ltd.: *See*—
Ueshima, Kumao, Imaida, and Nakasono. 3,371,918.

Yeomans, Lena S.: *See*—
Ronceray, Robert A. M., Yeomans, and Ronceray, A. J. L., F. M. M., and P. R. 3,371,872.

Yoshida, Hiroshi: *See*—
Mito, Satoru, Yoshida, Ote, and Shimotori. 3,371,908.

Yoshida, Tomio, and Y. Riko, to Matsushita Electric Industrial Co., Ltd. Electrostatic electro-acoustic transducer. 3,372,245, 3–5–68, Cl. 179—111.

Yost, Oscar A. Propeller drive shaft and bearing assembly. 3,371,644, 3–5–68, Cl. 115—.5.

Youmans, Arthur H., to Dresser Industries, Inc. Borehole activation logging system comprising varying strata irradiation as a function of the rate of change of tool velocity. 3,372,277, 3–5–68, Cl. 250—83.3.

Youngstown Steel Door Co., The: *See*—
Herr, Theodore Z., and Hoverman. 3,371,445.

Zahn, Hermann, Friction wheel cigarette lighter. 3,371,508. 3–5–68, Cl. 67—7.1.

Zahnraderfabrik Renk A.G.: *See*—
Zaunberger, Franz X., and Kugler. 3,371,734.

Zaunberger, Franz X., and A. Kugler, to Zahnraderfabrik Renk A.G. Steering system for endless track vehicles. 3,371,734, 3–5–68, Cl. 180—6.44.

Zellweger Ltd.: *See*—
Felix, Ernst. 3,371,568.

Zeman, David G., to Floroware Corp. Pot comstructions. 3,371,819, 3–5–68, Cl. 220—69.

Zerand Corp.: *See*—
Zernov, Peter. 3,371,584.

Zernov, Peter, to Zerand Corp. Self-combing pin type stripper for blank-forming apparatus. 3,371,584, 3–5–68, Cl. 93—36.

Zervos, Constantinus E.: *See*—
Graham, Gordon C., and Zervos. 3,371,770.

Zhemchuzhin, Sergei G.: *See*—
Bliznjuk, Nickolai K., Kolomiets, and Zhemchuzhin. 3,372,211.

Zhilin, Stanislav N.: *See*—
Belousov, Vasily F., Zhilin, and Butkin. 3,371,727.

Ziegler: *See*—
Ziegler, Karl, and Lehmkuhl. 3,372,097.

Ziegler, Karl, and H. Lehmkuhl, to Ziegler. Electrolytic process for the manufacture of metal alkyls. 3,372,097, 3–5–68, Cl. 204—59.

Zielasko, Horst, to Felton & Guilleaume Carlswerk Aktiengesellschaft. Solenoid arrangement. 3,372,355, 3–5–68, Cl. 335—280.

Zienty, Ferdinand B., and A. A. Schleppnik, to Monsanto Co. S-substituted-p-mercaptothiolbutyrates. 3,372,179, 3–5–68, Cl. 260—455.

Zimmerman, James R.: *See*—
Schlager, Wilfred C., and Zimmerman. 3,371,840.

Zimmerman, Markus: *See*—
Baumann, Peter, Zimmermann, and Häfliger. 3,372,157.

Zipper, Donald H.: *See*—
Owen, Ronald C., and Zipper. 3,371,813.

Zito, George V.: *See*—
Chilton, Edward A., and Zito. 3,372,266.

Zuk, Paul, to Bell Telephone Laboratories, Inc. Fabrication of semiconductor integrated devices with a PN junction running through the wafer. 3,372,070, 3–5–68, Cl. 148—186.

Zumi, Hirokazu: *See*—
Kometani, Yutaka, Koda, Sugiun, and Zumi. 3,372,082.

Zweede, Alexander K.: *See*—
Lynch, Donald L., and Zweede. 3,372,292.

Zysk, Edward D., to Engelhard Industries, Inc. Noble metal thermocouple having base metal leads. 3,372,026, 3–5–68, Cl. 136—227.

CLASSIFICATION OF PATENTS

ISSUED MARCH 5, 1968

NOTE.—First number, class; second number, subclass; third number, patent number

2–338	3,371,351	29–613	3,371,411	62– 45	3,371,498	84–327	3,371,570	114– 77	3,371,639	156–306	3,372,078
3– 1	3,371,352	621	3,371,412	55.5	3,371,499	502	3,371,571	121	3,371,640	360	3,372,079
4– 99	3,371,353	629	3,371,413	117	3,371,500	85– 7	3,371,572	153	3,371,641	435	3,372,080
173	3,371,354	630	3,371,414	160	3,371,501	87– 37	3,371,573	206	3,371,643	583	3,372,081
222	3,371,355	30– 90.3	3,371,415	234	3,371,502	88– 14	3,371,574	115– .5	3,371,644	158– 36.4	3,371,698
239	3,371,356	233	3,371,416	256	3,371,503	24	3,371,575		3,371,645	119	3,371,699
5– 83	3,371,357	293	3,371,417	320	3,371,505		3,371,576	70	3,371,646	160– 84	3,371,700
108	3,371,358	33–126.7	3,371,418	324	3,371,504		3,371,577	116–114	3,371,647	235	3,371,701

TRADEMARKS

NOTICES

Reprint of "Consolidated Listing of Notices"

An extract from the Decision Leaflet and the OFFICIAL GAZETTE of January 16, 1968, entitled "Consolidated Listing of Recent O.G. Notices Re Patent Office Practices and Procedures" has been reprinted and is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402. Price 10 cents.

Service by Publication

A petition to cancel each of the registrations identified below having been filed, and the notice of such proceedings sent by registered mail to each registrant at the last known address having been returned by the Post Office as undeliverable, notice is hereby given that unless the registrants listed herein, their assigns or legal representatives, shall enter an appearance within thirty days from the date of this publication, the cancelation will be proceeded with as in the case of default.

Firma Kurt Atmanspacher KG, by divestment from Attorney General of the United States (vested from A. Atmanspacher by Vesting Order), Endingen (Kaiserstuhl) Germany, Reg. No. 264,475, Canc. No. 8942.

Big Daddy's Enterprises, La Jolla, Calif., Reg. No. 736,910, Canc. No. 9045.

EDWIN L. REYNOLDS,
First Assistant Commissioner of Patents.

CONDITION OF TRADEMARK APPLICATIONS AS OF JANUARY 31, 1968

Total number of applications awaiting action [excluding renewals and Sec. 12(c)]	17,851
Date of oldest new application	Mar. 1, 1967
Date of oldest amended application (filing date)	Aug. 4, 1964

Registrations Issued ---------- 441—No. [illegible]45,224 to No. 845,664
Renewals Issued ---------- 60

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402 to whom all subscriptions should be made payable and all communications addressed; subscription price, $12.00 per annum, foreign mailing $4.00 additional; single copies, 25 cents each.

PRINTED COPIES OF TRADEMARK REGISTRATIONS are furnished by the Patent Office for 20 cents each. Address orders to the Commissioner of Patents, Washington, D.C. 20231.

MARKS PUBLISHED FOR OPPOSITION

SECTION 1

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Application for the registration of these marks in more than one class has been filed as provided in section 30 of said act as amended by Public Law 772, 87th Congress, approved Oct. 9, 1962, 76 Stat. 769. Opposition under section 13 may be filed within thirty days of this publication. See Rules 2.101 to 2.105.

A separate fee of twenty-five dollars for each class opposed must accompany the opposition.

[NOTE: For publication of marks presented in applications for registration in one class, see section 2.]

SN 246,221. Magnetics, Inc., East Butler, Pa. Filed May 9, 1966.

MAGNETICS inc.

Owner of Reg. No. 710,186.

Class 21—Electrical Apparatus, Machines, and Supplies

For Industrial Control Equipment and Systems—Namely, Power Regulators, Inverters, Converters, Frequency Modifiers, Regulated Power Supplies, Transformers, and Saturable Reactors (Int. Cl. 9).

Class 26—Measuring and Scientific Appliances

For Tansductors, Magnetometers, and Magnetic-Measuring Instrumentation—Namely, Shunt Amplifiers and D.C. Current Transformers (Int. Cl. 9).

First use January 1954.

SN 251,578. Naco Industries, Inc., New York, N.Y. Filed Aug. 3, 1966.

Naco

Class 21—Electrical Apparatus, Machines, and Supplies

For Radios (Int. Cl. 9).

Class 36—Musical Instruments and Supplies

For Tape Recorders (Int. Cl. 9).

First use July 22, 1966.

SN 253,252. Orrville Products, Inc., Orrville, Ohio. Filed Aug. 29, 1966.

ORRVILLE

Class 2—Receptacles

For Pressurizable Storage Tanks and Containers (Int. Cl. 6).

Class 19—Vehicles

For Motor Vehicle Bodies and Cabs (Int. Cl. 12).

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Material Handling Equipment—Namely, Belt Conveyors, Roller Conveyors, Overhead Conveyors, and Turntables; and Off-Highway Vehicle Cabs (Int. Cl. 7).

First use at least before 1930.

SN 260,997. Interstyle AG., Glarus, Switzerland. Filed Dec. 19, 1966.

GREENAGER

Priority claimed under Sec. 44(d) on Swiss Reg. No. 219,382, dated June 23, 1966.

Class 39—Clothing

For Costumes, Dresses, Coats, Jackets, Trousers, Blouses, Shirts, Blazers, Aprons, Overalls, Skirts, Hosiery, Bathing Suits, Caps, Hats, Gloves, Scarves, Lingerie; Men's Underwear; Children's Undermwear; Collars, Neckties, Vests, Pajamas, Night Gowns, Dressing Gowns, Corsets, Corselets, Bodices, Brassieres, Suspender Belts, Sweaters, Boots, Shoes, and Slippers (Int. Cl. 25).

Class 42—Knitted, Netted, and Textile Fabrics, and Substitutes Therefor

For Textile Piece Goods for Use in Making Costumes, Dresses, Coats, Jackets, Trousers, Blouses, Shirts, Bathing Suits, Caps, Gloves, Scarves, Lingerie, Underwear, Collars, Neckties, Pajamas, Dressing Gowns, Corsets, Brassieres, and the Like (Int. Cl. 24).

SN 273,224. Clairol Incorporated, New York, N.Y. Filed June 7, 1967.

CATAMARAN

Class 51—Cosmetics and Toilet Preparations

For Hair Tinting, Dyeing, and Coloring Preparation, Men's Hair Lightener, Men's Cologne, Men's Hair Spray, Men's Deodorant, and After-Shave Lotion (Int. Cls. 3 and 5).

Class 52—Detergents and Soaps

For Toilet Soap (Int. Cl. 3).

First use Mar. 14, 1967.

SN 276,387. Telonic Industries, Inc., Beech Grove, Ind. Filed July 20, 1967.

Telonic

Owner of Reg. No. 625,297.

Class 21—Electrical Apparatus, Machines, and Supplies

For Electrical Apparatus and Supplies—Namely, Attenuators; Sweep Generators; Fixed and Tunable Frequency Multipliers; Radio Frequency Switches; Voltage Regulation Power Supplies; Bandpass Filters; Lowpass Filters; Tunable Filters; Frequency Diplexers; Frequency Multiplexers; Impedance Transformers; Video and Radio Frequency Amplifiers; Fixed and Tunable Oscillators; and Power Dividers (Int. Cl. 9).

Class 26—Measuring and Scientific Appliances

For Spectrum Analysis Equipment; Attenuators for Test Equipment; Radio Frequency Detectors; Terminations and Mismatch Terminations for the Measurement of Voltage Reflection Coefficient and VSWR in Coaxial Systems; Cavity Wavemeters; Frequency Marker Generators for Measurement of Frequency; Rho-Tector Impedance Bridges for Measurement of Voltage Reflection Coefficient; Sweep Generators for Measuring Frequency Response; Marker Oscillators for Measurement of Frequency; Color Bar Generators for Measurement of Color Purity and Convergence; White Dot Generators for Measurement of Color Purity, Convergence and Linearity; and Oscilloscopes (Int. Cl. 9).

First use Mar. 20, 1953.

SECTION 2

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Opposition under section 13 may be filed within thirty days of publication. See Rules 2.101 to 2.105.

A fee of twenty-five dollars must accompany the opposition.

[NOTE: For publication of marks presented in a combined application for registration in more than one class, see section 1.]

Class 1—Raw or Partly Prepared Materials

SN 256,719. Carworth, Inc., New City, N.Y. Filed Oct. 19, 1966.

FORMULIZED

For Laboratory Animals (Int. Cl. 31).
First use on or about July 18, 1966.

SN 257,484. Hammond Plastics, Inc., Worcester, Mass. Filed Oct. 28, 1966.

GORDON SUPERFLEX

For Polystyrene in Granular Form Sold in Bulk (Int. Cl. 1).
First use 1952; July 1946 as to "Gordon."

SN 257,485. Hammond Plastics, Inc., Worcester, Mass. Filed Oct. 28, 1966.

GORDON SUPERFLOW

For Polystyrene in Granular Form Sold in Bulk (Int. Cl. 1).
First use August 1956; July 1946 as to "Gordon."

SN 257,845. Fredonia Seed Company, Fredonia, N.Y. Filed Nov. 3, 1966.

FUN-TASTIC

For Vegetable and Flower Seeds of Novelty Varieties (Int. Cl. 31).
First use Sept. 12, 1966.

SN 257,846. Fredonia Seed Company, Fredonia, N.Y. Filed Nov. 3, 1966.

FUN-TASTIC

For Vegetable and Flower Seeds of Novelty Varieties (Int. Cl. 31).
First use Sept. 12, 1966.

SN 261,320. Pan-American Bulb Co. Ltd., North Surrey, British Columbia, Canada. Filed Dec. 22, 1966.

WINDMILL BRAND

Applicant disclaims any exclusive use of the word "Brand" apart from the mark as shown. Owner of Canadian Reg. No. 114,726, dated July 17, 1959.

For Flower Bulbs, Shrubs, Rose Bushes, Trees, and Perennial Roots (Int. Cl. 31).

SN 269,071. Golden State Sheep Tanning Co., Brooklyn, N.Y. Filed Apr. 13, 1967.

SULTRALAMB

Owner of Reg. No. 621,453.
For Sheared Process Lamb Skins (Int. Cl. 18).
First use July 14, 1966.

SN 269,108. Charles A. Roberts, d.b.a. Foot Balance Posture Clinic, and Foot Posture Controls, Sherman, Tex. Filed Apr. 13, 1967.

RO COP

For Plastic Materials To Be Used as a Leather Substitute (Int. Cl. 18).
First use Oct. 1, 1966.

SN 269,332. Monsanto Company, St. Louis, Mo. Filed Apr. 17, 1967.

ANYWEAR

For Synthetic Fibers and Filaments (Int. Cl. 22).
First use Mar. 30, 1967.

SN 269,406. The Dow Chemical Company, Midland, Mich. Filed Apr. 18, 1967.

TYBRENE

Owner of Reg. Nos. 661,262, 715,942, and 772,563.
For Synthetic Resins (Int. Cl. 1).
First use Nov. 30, 1964.

SN 269,427. Kanematsu-Gosho (U.S.A.) Inc., New York, N.Y. Filed Apr. 18, 1967.

VINYBAN

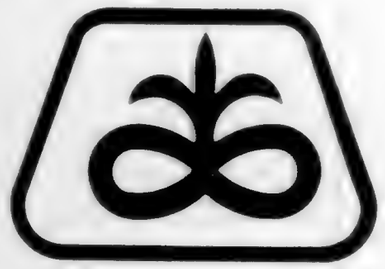
For Plastic Film and Sheet Material Particularly of Polyvinyl Chloride (Int. Cl. 17).
First use Apr. 1, 1967.

SN 269,559. Pioneer Hi-Bred Corn Company, Des Moines, Iowa. Filed Apr. 19, 1967.

PIONEER

For Live Cattle and Semen for Artificial Insemination (Int. Cl. 31).
First use about Apr. 25, 1966, on semen.

SN 269,560. Pioneer Hi-Bred Corn Company, Des Moines, Iowa. Filed Apr. 19, 1967.



For Live Cattle and Semen for Artificial Insemination (Int. Cl. 31).
First use about Apr. 25, 1966, on semen.

SN 269,749. Diamond Mica Company, Spruce Pine, N.C. Filed Apr. 21, 1967.

SILVERSHEEN

For Ground Mica (Int. Cl. 17).
First use in or about November 1923.

SN 269,750. Diamond Mica Company, Spruce Pine, N.C. Filed Apr. 21, 1967.

DIAMOND SHEEN

For Ground Mica (Int. Cl. 17).
First use in or about November 1923.

SN 269,751. Diamond Mica Company, Spruce Pine, N.C. Filed Apr. 21, 1967.

SILVERSHEEN SPECIAL

For Ground Mica (Int. Cl. 17).
First use in or about November 1923.

SN 284,928. Middletown Industries Corporation, Middletown, Conn. Filed Nov. 15, 1967.

MIRRAKAF

Owner of Reg. No. 443,773.
For Vinyl Fabrics in the Piece Used as a Leather Substitute (Int. Cl. 18).
First use Jan. 7, 1958.

SN 286,063. Domtar Limited, Montreal, Quebec, Canada. Filed Dec. 4, 1967.

For Wood Pulp (Int. Cl. 1).
First use on or about Jan. 25, 1967; in commerce on or about Jan. 25, 1967.

SN 286,064. Domtar Limited, Montreal, Quebec, Canada. Filed Dec. 4, 1967.

For Wood Pulp (Int. Cl. 1).
First use on or about Aug. 1, 1967; in commerce on or about Aug. 1, 1967.

SN 286,065. Domtar Limited, Montreal, Quebec, Canada. Filed Dec. 4, 1967.

For Wood Pulp (Int. Cl. 1).
First use on or about Aug. 7, 1967; in commerce on or about Aug. 7, 1967.

SN 286,744. Badger Research Corp., Madison, Wis. Filed Dec. 12, 1967.

BR-HD

For Albino Rats (Int. Cl. 31).
First use Oct. 25, 1967.

Class 2 — Receptacles

SN 245,609. Owens-Illinois, Inc., Toledo, Ohio. Filed May 13, 1966.

Owner of Reg. Nos. 359,502, 798,554, and others.
For Caddies, Servers, and Holders Made of Metal for Glassware (Int. Cl. 21).
First use July 31, 1964.

SN 247,406. Presque Isle Paper Products, Inc., Erie, Pa. Filed June 6, 1966.

PRESCO-PAK

For Foam Envelopes and Folders and Pocket-Like Shipping Containers for Packaging and Shipping (Int. Cl. 16).
First use Dec. 8, 1965.

SN 248,292. Hemis Company, Inc., Minneapolis, Minn. Filed June 17, 1966.

RE-CLOS-IT

Owner of Reg. No. 738,829.
For Polyethylene Bags (Int. Cl. 20).
First use Jan. 11, 1961.

SN 270,222. Burdick & Son, Inc., Albany, N.Y. Filed Apr. 28, 1967.

The mark consists of a fanciful letter "B" with an "S" superimposed thereon within a partial circle.
For Metal Containers (Int. Cl. 6).
First use on or about Mar. 23, 1967.

SN 271,600. Copco, Inc., New York, N.Y. Filed May 16, 1967.

PANTRY WALL

For Canister Sets, Spice Racks, Paper Dispensers, and Bread Boxes of Wood, Metal, and Plastic in Combination (Int. Cl. 21).
First use Mar. 1, 1967.

SN 276,520. Alton Box Board Company, Wilmington, Del. Filed July 21, 1967.

LEAF PAC

The term "Pac" is disclaimed apart from the mark as shown.
For Paperboard Blanks for Erection Into Containers at the Point of Use (Int. Cl. 16).
First use May 24, 1967.

Class 3 — Baggage, Animal Equipments, Portfolios, and Pocketbooks

SN 272,216. Samsonite Corporation, Denver, Colo. Filed May 23, 1967.

SATURN

For Luggage (Int. Cl. 18).
First use Apr. 28, 1966.

Class 4 — Abrasives and Polishing Materials

SN 256,114. Mink Oil Waterproofing Co., Portland, Oreg. Filed Oct. 10, 1966.

The words "Shoe Polish" and "White" are disclaimed apart from the mark as shown. The drawing is lined for the color brown.
For Shoe Polish (Int. Cl. 3).
First use Jan. 3, 1965.

SN 260,373. Vibraslide, Inc., Binghamton, N.Y. Filed Dec. 8, 1966.

Applicant disclaims the words "Abrasives" and "Compounds" as used in the mark.
For Compound Containing Abrasive Grain and Soap (Int. Cl. 3).
First use Feb. 8, 1962.

SN 271,019. American Cyanamid Company, Wayne, N.J. Filed May 9, 1967.

LIQUIFLOR

For Floor Polish (Int. Cl. 3).
First use Apr. 26, 1967.

SN 271,023. American Cyanamid Company, Wayne, N.J. Filed May 9, 1967.

APPEAL

For Furniture Polish (Int. Cl. 3).
First use Apr. 26, 1967.

SN 271,238. Economics Laboratory, Inc., St. Paul, Minn. Filed May 11, 1967.

S'COR

Owner of Reg. No. 505,072.
For Deburring Compound (Int. Cl. 3).
First use Apr. 1, 1967.

Class 5 — Adhesives

SN 265,410. Doric Corporation, Oklahoma City, Okla. Filed Feb. 24, 1967.

PELLMELTS

For Hot Melt Adhesives in Pellet Form Composed of 100 Percent Solids and Containing Synthetic Resins and/or Natural Resins, Waxes, and Modifiers (Int. Cl. 1).
First use Jan. 19, 1967.

SN 265,411. Doric Corporation, Oklahoma City, Okla. Filed Feb. 24, 1967.

HOTPELTS

For Hot Melt Adhesives in Pellet Form Composed of 100 Percent Solids and Containing Synthetic Resins and/or Natural Resins, Waxes, and Modifiers (Int. Cl. 1).
First use Jan. 19, 1967.

SN 265,412. Doric Corporation, Oklahoma City, Okla. Filed Feb. 24, 1967.

CHIPMELTS

For Hot Melt Adhesives in Pellet Form Composed of 100 Percent Solids and Containing Synthetic Resins and/or Natural Resins, Waxes, and Modifiers (Int. Cl. 1).
First use Jan. 19, 1967.

SN 265,413. Doric Corporation, Oklahoma City, Okla. Filed Feb. 24, 1967.

IAPCO

For Hot Melt Adhesives in Pellet Form Composed of 100 Percent Solids and Containing Synthetic Resins and/or Natural Resins, Waxes, and Modifiers (Int. Cl. 1).
First use 1950.

SN 287,208. Ashland Oil & Refining Company, Cleveland, Ohio. Filed Dec. 19, 1967.

ISOCURE

For Synthetic Resin Binders for Making Foundry Cores and Molds (Int. Cl. 1).
First use on or about Aug. 4, 1967.

Class 6 — Chemicals and Chemical Compositions

SN 260,010. Edward W. Bissette, d.b.a. Bissette Company, Clinton, N.C. Filed Dec. 5, 1966.

ION-707

For Battery Preservative (Int. Cl. 1).
First use in or about May 1966.

SN 261,587. Kay-Fries Chemicals, Inc., West Haverstraw, N.Y. Filed Dec. 28, 1966.

OCTRIC

For Organic Chemical Intermediates, Primarily Tricarboxypentane Acid and Its Derivatives (Int. Cl. 1).
First use on or about Dec. 7, 1966.

SN 261,853. Walter G. Legge Company, Inc., New York, N.Y. Filed Jan. 3, 1967.

STAT-LES

For Anti-Static Compound for Treating Textile Materials To Inhibit Surface Changes Thereon (Int. Cl. 1).
First use Nov. 22, 1966.

SN 275,211. Aire Research Limited, Columbia, S.C. Filed July 3, 1967.

BANISH

For Room Deodorant (Int. Cl. 5).
First use Sept. 27, 1966.

Class 9 — Explosives, Firearms, Equipments, and Projectiles

SN 262,389. Atlas Chemical Industries, Inc., Wilmington, Del. Filed Jan. 12, 1967.

TWISTITE

For Explosive Cartridges (Int. Cl. 13).
First use July 9, 1943.

Class 11 — Inks and Inking Materials

SN 272,015. Bowers Printing Ink Company, Chicago, Ill. Filed May 22, 1967.

CRYSTAL-GLOW

Owner of Reg. No. 804,119.
For Printing Ink (Int. Cl. 2).
First use Mar. 8, 1967.

Class 12 — Construction Materials

SN 232,277. Customwood Manufacturing Company, Albuquerque, N. Mex., assignee of Robert T. Bogan, Jr., Albuquerque, N. Mex. Filed Nov. 8, 1965.

Customwood

For Architectural Carved Wood Grilles (Int. Cl. 19).
First use February 1960.

SN 257,886. Pennsylvania Pacific Corporation, Wasminster, Pa. Filed Nov. 3, 1966.

PANELUCENT

For Curtain Walls for Buildings (Int. Cl. 19).
First use July 11, 1966.

SN 257,887. Pennsylvania Pacific Corporation, d.b.a. Penn Pac, Warminster, Pa. Filed Nov. 3, 1966.

SOUNDIVIDER

For Panels Used as Interior and Exterior Building Walls (Int. Cl. 19).
First use Apr. 15, 1966.

SN 259,339. Owens-Corning Fiberglas Corporation, Toledo, Ohio. Filed Nov. 23, 1966.

DIMENSIONAIRE

For Ceiling Systems (Int. Cl. 19).
First use Oct. 17, 1966.

SN 267,429. International Paper Company, New York, N.Y. Filed Mar. 23, 1967.

Fiesta

Owner of Reg. No. 798,719.
For Wood Panelling Made From Plywood Composition Board, Particle Board, or Flakeboard (Int. Cl. 19).
First use Feb. 17, 1967.

SN 268,609. National Gypsum Company, Buffalo, N.Y. Filed Apr. 7, 1967.

ECONAFIBRE

For Ceiling Tile (Int. Cl. 19).
First use Mar. 7, 1967.

SN 268,611. National Gypsum Company, Buffalo, N.Y. Filed Apr. 7, 1967.

TONICO

For Acoustical Tile (Int. Cl. 19).
First use Mar. 2, 1967.

SN 269,453. Ranco Industrial Products Corporation, Cleveland, Ohio. Filed Apr. 18, 1967.

FILLCON

For Resin Reinforced Asphalt and Aggregate Mix for Filling Conduit Trenches in Wood Block Floors (Int. Cl. 19).
First use on or about June 1, 1966.

SN 270,100. National Homes Corporation, Lafayette, Ind. Filed Apr. 27, 1967.

HOMES DESIGNED WITH YOUTH IN MIND

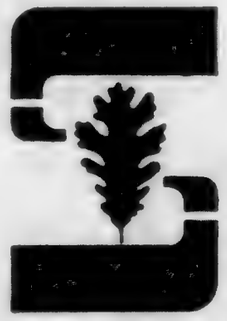
"Homes" is disclaimed apart from the mark as shown.
For Prefabricated Homes (Int. Cl. 19).
First use Feb. 2, 1967.

SN 271,297. Vetreria di Vernante S.p.A., Cuneo-Spinetta, Italy. Filed May 11, 1967.

HEMERA

Owner of Italian Reg. No. 181,079, dated Jan. 10, 1966.
For Glass Doors (Int. Cl. 19).

SN 280,918. Chester B. Stem, Incorporated, New Albany, Ind. Filed Sept. 22, 1967



The mark comprises a stylized letter "S" and a representation of an oak leaf within the curved portion thereof
For Hardwood Lumber and Sliced Wood (Int. Cl. 19).
First use Dec. 23, 1966.

Class 13 — Hardware and Plumbing and Steam-Fitting Supplies

SN 252,407. National Lock Co., Rockford, Ill. Filed Aug. 15, 1966.

BECKBOLT

For Construction Bolts or Fasteners (Int. Cl. 6).
First use July 25, 1966.

SN 254,616. National Lock Co., Rockford, Ill. Filed Sept. 16, 1966.

HELLENIC

For Cabinet Hardware—Namely, Knobs, Pulls, and Backplates (Int. Cl. 6).
First use Dec. 10, 1965.

SN 255,185. C. E. M. Company, Inc., Danielson, Conn. Filed Sept. 27, 1966.

GRIPrite

For Clinch Nuts (Int. Cl. 6).
First use June 16, 1966.

SN 262,481. Electro-Mechanical Enterprises, Inc., Westerly, R.I. Filed Jan. 13, 1967.

POSI-SEAL

For Valves and Components for Valves (Int. Cl. 6).
First use Oct. 21, 1966.

SN 269,737. Cameron Iron Works, Inc., Houston, Tex. Filed Apr. 21, 1967.

CAMERON

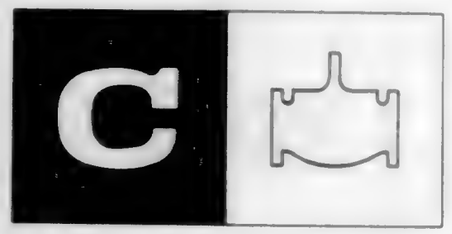
Owner of Reg. Nos. 560,168, 786,400, and others.
For Pipe (Int. Cl. 6).
First use 1955.

SN 272,295. Carl Erik Josef Nyberg, Skovde, Sweden. Filed May 24, 1967.

CEJN

Owner of Swedish Reg. No. 80,221, dated Apr. 13, 1956.
For Pipe and Hose Couplings (Int. Cl. 6).

SN 284,786. Cla-Val Co., Newport Beach, Calif. Filed Nov. 14, 1967.



For Valves and Controls Adapted To Be Connected in Pipe Lines To Control the Flow of Liquid and Gas, and Replacement Parts Therefor (Int. Cl. 6).
First use as early as June 30, 1956.

Class 15 — Oils and Greases

SN 262,560. Atlantic Richfield Company, Philadelphia, Pa. Filed Jan. 16, 1967.

ARCONOL

Owner of Reg. Nos. 741,160 and 744,003.
For Gasoline Supplement (Int. Cl. 1).
First use Nov. 17, 1966.

SN 276,558. Ray Hook, d.b.a. Addzip Additives, Escalon, Calif. Filed July 21, 1967.

"Blendzall"

For Motor Oil (Int. Cl. 4).
First use Oct. 2, 1959.

SN 280,472. Sinclair Refining Company, New York, N.Y. Filed Sept. 15, 1967.

DINOLENE

Owner of Reg. Nos. 342,874, 779,741, and others.
For Motor Oils and Lubricating Oils (Int. Cl. 4).
First use July 26, 1966.

Class 16 — Protective and Decorative Coatings

SN 253,885. Iowa Paint Manufacturing Company, Inc., Des Moines, Iowa. Filed Sept. 6, 1966.

GALVA-BOND

For Paint Substance Used as a Primer for Old Oxidized, Unpainted, or Mildly Rusted Galvanized Metal or Other Metal Surfaces (Int. Cl. 2).
First use on or about Dec. 1, 1958.

SN 257,216. United States Rust Control Corporation, Miami, Fla. Filed Oct. 25, 1966.

The lining on the letters of the mark does not represent color
For Rust and Corrosion Protective Coating With Incidental Lubricating Properties (Int. Cl. 2).
First use Mar. 1, 1966.

SN 259,579. Produits Chimiques Pechiney Saint-Gobain, Paris, France. Filed Nov. 28, 1966.

PEINTAL

Owner of French Reg. No. 526,740, dated Dec. 28, 1964 (Seine); Natl. Inst. No. 237,926.
For Alumina Based, Active Pigment Additives, for Use With Paint (Int. Cl. 2).

SN 261,852. Walter G. Legge Company, Inc., New York, N.Y. Filed Jan. 3, 1967.

KOLACRIL

For Acrylic Paint Enamel (Int. Cl. 2).
First use Nov. 22, 1966.

SN 263,384. Kyanize Paints, Inc., Everett, Mass. Filed Jan. 26, 1967.

ZYLOX

For Paint-Like Zinc Chromate Primer for Metals (Int. Cl. 2).
First use November 1947.

SN 263,923. Kyanize Paints, Inc., Everett, Mass. Filed Feb. 3, 1967.

KYANIZE KY PRIME

The word "Prime" is disclaimed from the mark as shown.
Owner of Reg. Nos. 60,252 and 129,333.
For Metal Primer (Int. Cl. 2).
First use July 22, 1966.

SN 264,427. Koppers Company, Inc., Pittsburgh, Pa. Filed Feb. 10, 1967.

DYNACOL

Owner of Reg. No. 782,708.
For Vinyl, Acrylic, Alkyd, and Chlorinated Rubber Protective Coatings, Including Thinners, and Primers Therefor (Int. Cl. 2).
First use Feb. 10, 1964.

Class 17 — Tobacco Products

SN 241,480. P. Lorillard Company, New York, N.Y. Filed Mar. 21, 1966.

DANVILLE

The lining on the representation of a horse in the drawing indicates shading, not color.
For Cigarettes (Int. Cl. 34).
First use Apr. 14, 1965.

SN 280,141. The American Tobacco Company, New York, N.Y. Filed Sept. 12, 1967.

NOVO

For Cigarettes (Int. Cl. 34).
First use Sept. 5, 1967.

SN 280,142. The American Tobacco Company, New York, N.Y. Filed Sept. 12, 1967.

NOVA

For Cigarettes (Int. Cl. 34).
First use Sept. 5, 1967.

Class 18 — Medicines and Pharmaceutical Preparations

SN 216,235. Clover Chemical Company, Eighty-Four, Pa. Filed Apr. 7, 1965.

For Preparation for Exterminating Worms and Other Parasites From Livestock (Int. Cl. 5).
First use Aug. 2, 1956.

SN 252,976. Veterinary Research Institute, Dallas, Tex., assignee of Veterinary Supply Depot Incorporated, Dallas, Tex. Filed Aug. 23, 1966.

BOVIM

For Vitamin and Mineral Nutritional Preparation for Veterinary Use, (Int. Cl. 5).
First use Aug. 11, 1966.

SN 259,337. Otsuka Chemical Co., Ltd., Higashi-ku, Osaka, Japan. Filed Nov. 23, 1966.

UNIFOAM

For Vesicatory (Int. Cl. 5).
First use September 1960; in commerce Sept. 1, 1960.

SN 259,338. Otsuka Chemical Co., Ltd., Higashi-ku, Osaka, Japan. Filed Nov. 23, 1966.

AZOFOAM

For Vesicatory (Int. Cl. 5).
First use September 1960; in commerce Sept. 1, 1960.

SN 262,393. Balch Flavor Company, Pittsburgh, Pa. Filed Jan. 12, 1967.

STAND-R-MIX

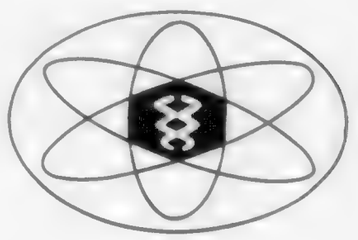
For Salts for Acid Control (Int. Cl. 5).
First use June 21, 1958.

SN 264,157. Neisler Laboratories, Inc., Decatur, Ill. Filed Feb. 7, 1967.

NEIPERTEC

For Radioactive Diagnostic Agent for Human Use (Int. Cl. 5).
First use on or about Jan. 23, 1967.

SN 264,158. Neisler Laboratories, Inc., Decatur, Ill. Filed Feb. 7, 1967.



For Radioactive Diagnostic and Therapeutic Agents for Human Use (Int. Cl. 5).
First use on or about Jan. 23, 1967.

SN 264,324. Kremers-Urban Company, Milwaukee, Wis. Filed Feb. 9, 1967.

PRE-PEN

For Penicilloyl Polylysine (a Compound Resulting From Bonding Penicilloic Acid to a Polymer of Lysine) Used as a Skin Test Antigen (Int. Cl. 5).
First use Jan. 19, 1967.

SN 264,740. Dow B. Hickam, Inc., Houston, Tex. Filed Feb. 15, 1967.

GRANULEX

For Pharmaceutical Preparation for the Treatment of Ulcers, Wounds, and Burns (Int. Cl. 5).
First use Dec. 21, 1964.

SN 264,900. Bristol-Myers Company, New York, N.Y. Filed Feb. 17, 1967.

FULL EFFECT

For Oral Antiseptic Mouthwash for Soothing Temporary Relief of Minor Sore Throat and Mouth Irritations (Int. Cl. 5).
First use Nov. 4, 1966.

SN 264,905. Bristol-Myers Company, New York, N.Y. Filed Feb. 17, 1967.

PURGE

For Oral Antiseptic Mouthwash for Soothing Temporary Relief of Minor Sore Throat and Mouth Irritations (Int. Cl. 5).
First use Sept. 27, 1966.

SN 267,794. Atomic Basic Chemicals Corporation, Eighty Four, Pa. Filed Mar. 29, 1967.

The lining on the shield is for shading purposes.
For Anthelmintic for Destroying Internal Parasites in Cattle, Sheep, etc., Comprising Phenothiazine (Int. Cl. 5).
First use Feb. 20, 1967.

SN 267,963. Mid-States Distributing Company, Inc., St. Paul, Minn. Filed Mar. 30, 1967.

MDC

Owner of Reg. No. 833,161.
For Vitamin Tablets, Preparation for Relief of Pain, Aspirin, and Cold Capsules (Int. Cl. 5).
First use Jan. 4, 1967.

SN 268,321. Neisler Laboratories, Inc., Decatur, Ill. Filed Apr. 4, 1967.

XENEISOL

For Radioactive Diagnostic Agent for Human Use (Int. Cl. 5).
First use on or about Mar. 21, 1967.

SN 269,689. Richardson-Merrell Inc., New York, N.Y. Filed Apr. 20, 1967.

EQUI-FLU II

For Equine Influenza Vaccine (Int. Cl. 5).
First use July 19, 1966.

SN 270,544. Bristol-Myers Company, New York, N.Y. Filed May 3, 1967.

VERSASTAPH

For Antibiotic (Int. Cl. 5).
First use Nov. 10, 1966.

SN 270,546. Bristol-Myers Company, New York, N.Y. Filed May 3, 1967.

DYNALECTAL

For Antibiotic (Int. Cl. 5).
First use Nov. 10, 1966.

SN 270,698. Ortho Pharmaceutical Corporation, Raritan, N.J. Filed May 4, 1967.

NEO-NOVUM SQ

Owner of Reg. No. 807,166.
For Hormone Preparation (Int. Cl. 5).
First use Mar. 1, 1967.

SN 271,014. Chas. Pfizer & Co., Inc., New York, N.Y. Filed May 9, 1967.

OTC-MIX

For Antibiotic Preparation for Veterinary Use (Int. Cl. 5).
First use Oct. 16, 1958.

SN 271,234. Dermik Laboratories, Inc., Syosset, N.Y. Filed May 11, 1967.

INGRALIN

For Pharmaceutical Preparation for the Treatment of Skin Diseases (Int. Cl. 5).
First use Dec. 7, 1966.

SN 271,256. Johnson & Johnson, New Brunswick, N.J. Filed May 11, 1967.

HEAD START

For Analgesic Preparation (Int. Cl. 5).
First use Mar. 3, 1967.

SN 272,085. Norden Laboratories, Inc., Lincoln, Nebr. Filed May 22, 1967.

TEMARIL-P

For Antipruritic-Antitussive for the Relief of Pruritus and Coughs in Dogs and Cats, Used in Veterinary Medicine (Int. Cl. 5).
First use on or about July 15, 1960.

SN 280,224. Flow Laboratories Incorporated, Rockville, Md. Filed Sept. 13, 1967.

redi-***FLOW***

For Barium Sulfate Gastric Suspension (Int. Cl. 5).
First use Aug. 30, 1967.

SN 284,789. Chas. Pfizer & Co., Inc., New York, N.Y. Filed Nov. 14, 1967.

IMUFORT

Owner of Reg. No. 627,661.
For Veterinary Biological Preparation for Vaccinating Healthy Swine Against Hog Cholera (Int. Cl. 5).
First use Nov. 1, 1967.

SN 285,174. Parke, Davis & Company, Detroit, Mich. Filed Nov. 20, 1967.

ELASE-CHLOROMYCETIN

Owner of Reg. Nos. 694,802 and 823,252.
For Ointment (Int. Cl. 5).
First use on or before Oct. 12, 1967.

SN 285,796. McNeil Laboratories, Inc., Fort Washington, Pa. Filed Nov. 29, 1967.

TYLENOL-B

Owner of Reg. No. 637,957.
For Analgesic Antipyretic Preparations (Int. Cl. 5).
First use Sept. 25, 1967.

Class 19—Vehicles

SN 249,498. The Buehler Corporation, Indianapolis, Ind. Filed July 5, 1966.

Applicant disclaims the word "Jet" apart from the mark as shown. The drawing is lined for the color red, but no claim is made for color alone. Owner of Reg. No. 702,175.
For Jet Boats (Int. Cl. 12).
First use Oct. 5, 1965; June 10, 1959, as to "Buehler."

SN 257,452. Avis Rent-A-Car System, Inc., Garden City, N.Y. Filed Oct. 28, 1966.

AVIS

Owner of Reg. Nos. 615,013, 703,700, and 758,577.
For Automotive Vehicles for Use on Public Highways (Int. Cl. 12).
First use 1953.

SN 262,607. McDowell-Wellman Engineering Company, Cleveland, Ohio. Filed Jan. 16, 1967.

PULL-TORQ

For Vessel Parts—Namely, Hatch Covers (Int. Cl. 12).
First use at least as early as January 1964.

SN 270,056. Goodyear Aerospace Corporation, Akron, Ohio. Filed Apr. 26, 1967.

PARASONIC

For Aerodynamic Decelerators in the Form of Parachutes Especially Designed for Reentry Conditions (Int. Cl. 12).
First use Dec. 3, 1965.

Class 20—Linoleum and Oiled Cloth

SN 260,650. Congoleum-Nairn Inc., Kearny, N.J. Filed Dec. 13, 1966.

SUPERGUARD

For Plastic Composition Floor Coverings in the Form of Sheets and Rolls (Int. Cl. 27).
First use Nov. 22, 1966.

Class 21—Electrical Apparatus, Machines, and Supplies

SN 247,299. Aktiebolaget Kanthal, Hallstahammar, Sweden. Filed June 6, 1966.

Owner of U.S. Reg. No. 421,615.
For Electric Wire and Cables, Electric Resistance Wire, Rod, Strip, Ribbons, Coils, High Temperature Tubing for Electrical Heating Applications, Protection Tubes for Thermocouples, Tube Elements for High Temperature Electric Furnaces, Insulated Wire, Electrical Heating Elements and Electrodes (Int. Cl. 9).
First use Dec. 31, 1941; in commerce Jan. 14, 1942.

SN 251,414. Fisher Radio Corporation, Long Island City, N.Y. Filed Aug. 1, 1966.

BABY GRAND

For Radio Phonographs (Int. Cl. 9).
First use Feb. 27, 1966.

SN 251,541. International Telephone and Telegraph Corporation, New York, N.Y. Filed Aug. 2, 1966.

TEL-TOUCH

For Telephone Subscriber Station Systems, and Parts Therefor (Int. Cl. 9).
First use on or before June 8, 1966.

SN 252,078. Denesco, Inc., Albuquerque, N. Mex. Filed Aug. 10, 1966.

The mark is a decorative combination of the letters "d, c, and o."
For Electronic Components—Namely, High Frequency Low Pass Filters, Capacitors, Combinations and Parts Thereof (Int. Cl. 9).
First use Dec. 17, 1965.

SN 252,164. Chelsea Industries, Inc., d.b.a. Hope Webbing Company, Pawtucket, R.I. Filed Aug. 11, 1966.

ASTRO-TEX

For Electronic Lacing Tape for Use in the Electronics Industry (Int. Cl. 9).
First use July 29, 1966.

SN 253,108. Antennacraft Company, Burlington, Iowa. Filed Aug. 25, 1966.

COLORSTAR

For Television, FM and High Frequency Antennas (Int. Cl. 9).
First use Feb. 25, 1964.

SN 256,296. Microtek Electronics Inc., Cambridge, Mass. Filed Oct. 12, 1966.

MTE

For Thick-Film Electronic Modules—Namely, Resistors, Capacitors, Hybrid-Circuit Amplifiers, and Resistor-Capacitor Networks, and for Laser-Welded Electrical Weldments (Int. Cl. 9).
First use Nov. 4, 1965.

SN 258,216. Edwards Company, Inc., Norwalk, Conn. Filed Nov. 8, 1966.

SURELITE

For Automatically Controlled Electrical Emergency Lighting Units (Int. Cl. 11).
First use Jan. 21, 1966.

SN 267,977. Radar Design Corporation, Syracuse, N.Y. Filed Mar. 30, 1967.

RD

For Microwave Components—Namely, Microwave Absorber Stock, Coaxial Attenuators, Adapters, Couplers, Filters, Gain Horns, Harmonic Generators, Hybrids, Loads, Mismatch, Mounts, Multiplexers, Phase Shifters, Power Dividers, Preselectors, Slotted Sections, Terminations and Loads, Tuners, Upconverters, and Wavemeters (Int. Cl. 9).
First use on or about Mar. 1, 1963.

SN 273,799. Simplex Wire and Cable Company, Cambridge, Mass. Filed June 13, 1967.

FOAM-CEL

For Cellular Polyolefin Insulated Coaxial Cable (Int. Cl. 9).
First use Nov. 13, 1964.

Class 22—Games, Toys, and Sporting Goods

SN 246,852. Atlantic Lures, Inc., Providence, R.I. Filed May 31, 1966.

BUNKER-SPOON

For Fishing Lures (Int. Cl. 28).
First use July 31, 1956.

SN 249,035. Mr. Mod Shop, Inc., New Orleans, La. Filed June 27, 1966.

"MAN OF THE DAY"

For Bridge Sets Consisting of Playing Cards, Score Pad, and Pencil (Int. Cl. 16).
First use Apr. 7, 1966.

SN 251,494. Design Enterprises, Inc., Eau Gallie, Fla. Filed July 29, 1966.

ARITHMEQUICK

For Caged Type Toy Containing Numbered Cubes for Playing an Educational Arithmetic Game (Int. Cl. 28).
First use Sept. 21, 1965.

SN 253,795. Standard Packaging Corporation, New York, N.Y. Filed Sept. 2, 1966.

NU-VUE

For Surface Finish Applied to Playing Cards (Int. Cl. 16).
First use Mar. 20, 1963.

SN 254,898. World Toy House, Inc., d.b.a. The Toy House, St. Paul, Minn. Filed Sept. 21, 1966.

SPEEDI-KIT

For Selected Groups of Toys Contained in a Package (Int. Cl. 28).
First use on or about June 1, 1963.

SN 254,899. World Toy House, Inc., d.b.a. The Toy House, St. Paul, Minn. Filed Sept. 21, 1966.

PROFIT-PAK

For Selected Groups of Toys Contained in a Package (Int. Cl. 28).
First use on or about Oct. 25, 1965.

SN 265,406. Gene Surles Corpening, d.b.a. Corpening Game Company, Granite Falls, N.C. Filed Feb. 24, 1967.

DISCOUNT

For Equipment Sold as a Unit for Playing a Board Game (Int. Cl. 28).
First use Mar. 14, 1958.

SN 267,307. Atech Enterprises, Inc., North Amityville, N.Y. Filed Mar. 22, 1967.

ATECH

For Equipment Sold as a Unit for Playing a Parlor Game; and Balancing Toys (Int. Cl. 28).
First use Oct. 13, 1966.

SN 272,435. Western Publishing Company, Inc., Racine, Wis. Filed May 25, 1967.

PEEPUL PALS

For Dolls, Doll Clothing and Accessories; Toy House, Trunk, Animals, and Furniture; Puzzles; Plastic Toys; Puppets; and Doll Kits Including the Aforementioned Items (Int. Cl. 28).
First use Feb. 27, 1967.

SN 273,170. Milton Bradley Company, Springfield, Mass. Filed June 6, 1967.

Roll-a-Puzzle

For Equipment Sold as a Unit for Playing a Puzzle Game (Int. Cl. 28).
First use Feb. 27, 1967.

SN 277,904. Eyerly Aircraft Company, Salem, Oreg. Filed Aug. 9, 1967.

LOOP-O-PLANE

For Amusement Park and/or Carnival Type Amusement Ride (Int. Cl. 28).
First use June 1, 1933.

SN 277,905. Eyerly Aircraft Company, Salem, Oreg. Filed Aug. 9, 1967.

ROLL-O-PLANE

For Amusement Park and/or Carnival Type Amusement Ride (Int. Cl. 28).
First use Aug. 1, 1937.

SN 278,902. Douglas H. Nye, Ashfield, Mass. Filed Aug. 23, 1967.

THE FRONT NINE

For Mechanical Take Apart Puzzles (Int. Cl. 28).
First use June 30, 1967.

SN 280,452. The Ohio Art Company, Bryan, Ohio. Filed Sept. 15, 1967.

MYSTERY PISTOL

Applicant disclaims the word "Pistol" apart from the mark as shown without waiving any of its common law rights in the mark.
For Game Apparatus Comprising a Target and a Toy Pistol (Int. Cl. 28).
First use July 19, 1967.

SN 283,303. J. Chein & Company, Burlington, N.J. Filed Oct. 25, 1967.

ELEVENZEES

For Apparatus Sold as a Unit for Playing an Amusement Game of Chance (Int. Cl. 28).
First use June 1967.

SN 286,288. J. Swedlin, Inc., d.b.a. Gund Manufacturing Company, Brooklyn, N.Y. Filed Dec. 5, 1967.

ACTI-MATION

For Stuffed Toys (Int. Cl. 28).
First use Nov. 10, 1967.

SN 286,290. J. Swedlin, Inc., d.b.a. Gund Manufacturing Company, Brooklyn, N.Y. Filed Dec. 5, 1967.

BEST OF BREED

For Stuffed Toys in Simulation of Animals (Int. Cl. 28).
First use Oct. 16, 1967.

SN 286,290. J. Swedlin, Inc., d.b.a. Gund Manufacturing Company, Brooklyn, N.Y. Filed Dec. 5, 1967.

TENDER LEE

For Stuffed Toys in Simulation of Animals (Int. Cl. 28).
First use Nov. 6, 1967.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

SN 246,350. Nippon Tenshashi Habushiki Kaisha, Higashisumiyoshi-ku, Osaka, Japan. Filed May 23, 1966.

For Cutters and Knives (Int. Cl. 8).
First use April 1962; in commerce October 1962.

SN 249,594. Sunbeam Corporation, Chicago, Ill. Filed July 5, 1966.

LAWN BUTLER

For Lawn Mowers Adaptable for Leaf and Debris Pickup and Collection (Int. Cl. 7).
First use May 14, 1966.

SN 257,668. Theodore Equipment Corporation, Wood-Ridge, N.J. Filed Oct. 31, 1966.

TEDDY

Owner of Reg. No. 825,218.
For Conveyors—Namely, Live Roller Conveyors, Gravity Roller Conveyors, Flat Belt Conveyors, Chain Belt Conveyors, Flight Link-Belt Conveyors, Chain-Belt Flight-Attachment Conveyors of the Horizontal, Vertical and Inclined Variety for Overhead, Table Level, Under-Floor and Under-Ceiling Level Applications (Int. Cl. 7).
First use June 1, 1966.

SN 258,221. Ford Motor Company, Dearborn, Mich. Filed Nov. 8, 1966.

ROTUNDA

For Hydraulic Lifts, Hydraulic Jacks, Power Tools—Namely, Wrenches, Bolt and Nut Drivers, Screwdrivers, and Hammers (Int. Cl. 7).
First use Dec. 27, 1963.

SN 259,327. John R. Lebb Distributors Inc. Moonachie, N.J. Filed Nov. 23, 1966.

BAG-O-MAT

For Shopping Bag Vending Machines (Int. Cl. 7).
First use Nov. 16, 1966.

SN 262,983. Utica Cutlery Company, Utica, N.Y. Filed Jan. 20, 1967.

UTI-KUT

For Kitchen Cutlery—Namely, Knives (Int. Cl. 8).
First use Aug. 17, 1966.

SN 263,168. General Equipment Co., Owatonna, Minn. Filed Jan. 24, 1967.

DIG-A-MOBILE

For Power Diggers (Int. Cl. 7).
First use Nov. 28, 1966.

SN 264,755. Package Machinery Company, East Longmeadow, Mass. Filed Feb. 15, 1967.

REED

Owner of Reg. No. 668,953.
For Plastic Molding Machines and Parts (Int. Cl. 7).
First use Nov 18, 1965.

SN 267,124. Buffalo Forge Company, Buffalo, N.Y. Filed Mar. 20, 1967.

ECON-O-RATED

For Centrifugal Pumps (Int. Cl. 7).
First use Feb. 20, 1967.

SN 268,947. Eaton Yale & Towne Inc., Cleveland, Ohio. Filed Apr. 12, 1967.

Fuller

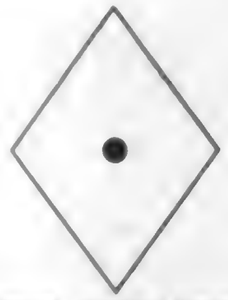
Owner of Reg. No. 527,995.
For Vehicle Gear Change Speed Transmissions and Parts Thereof Consisting of Clutches, Gears, and Supporting Shaft (Int. Cl. 12).
First use during the year 1937.

SN 269,498. The Harker Manufacturing Company, Tampa, Fla. Filed Apr. 19, 1967.

"Mr Can"

For Can Washers, Bag Unloaders, Conveyors, and Other Can Handling Equipment (Int. Cl. 7).
First use Jan. 15, 1946.

SN 269,914. McGraw-Edison Company, Elgin, Ill. Filed Apr. 12, 1967.



For Pruners, Clippers, Pruning Shears, Lopping Shears, Hedge Cutting Shears, Grass Cutters, Snippers, and Tree Pruners (Int. Cl. 8).
First use October 1966.

SN 269,920. Oneida Ltd., Oneida, N.Y. Filed Apr. 24, 1967.

WHISPERING SAND

For Stainless Steel Flatware (Int. Cl. 8).
First use Apr. 7, 1967.

SN 270,345. John Blue Company, Incorporated, Huntsville, Ala. Filed May 1, 1967.

BLUE

Owner of Reg. No. 354,308.
For Agriculture Equipment—Namely, Insecticide, Herbicide, and Fertilizer Distributors and Equipment and Replacement Parts Therefor (Int. Cl. 7).
First use on or about Dec. 1, 1964; at least as early as 1886 as to "Blue."

SN 270,367. Evans-Aristocrat Industries, Inc., Elizabeth, N.J. Filed May 1, 1967.

MINI-KNIFE

For Knives (Int. Cl. 8).
First use Oct. 21, 1966.

SN 270,498. Mar Hook & Equipment, Inc., Aberdeen, Wash. Filed May 2, 1967.

MAR

For Equipment and Machinery for the Forest Industry—Namely, Traveling Bridge Cranes, Logging Truck Trailer Hoists, Log Grapple-Tongs, Self-Releasing Hooks, Automatic Log Grapples, Shovel Heeling Racks for Loading Logs, Sky Carriages, Mechanical Tree Harvesters, and Automatic Tree Planters (Int. SN 272,959. The Stephan Co., Fort Lauderdale, Fla. Filed June 2, 1967.

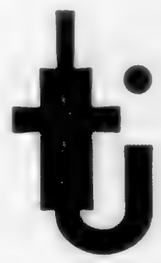
ACU-CUT

For Hair Thinning Shears (Int. Cl. 8).
First use Mar. 11, 1967.

Class 26—Measuring and Scientific Appliances

SN 253,801. Temtech, Inc., Santa, Ana, Calif. Filed Sept. 2, 1966.



For Temperature Transducers—Namely, Resistance Temperature Transducers, Voltage Temperature Transducers, Thermistor Temperature Transducers, Thermocouple Temperature Transducers, Thermowells, Thermowell Assemblies, Temperature Sensor Heaters; and Electronic Instruments, Devices, and Systems for Use With Temperature Transducers—Namely, Signal Conditioners for Resistance Temperature Transducers, Signal Conditioners for Resistance Strain Gauges, Signal Conditioners for Thermocouples, Signal Conditioners for Signal Conditioning Amplifiers, Temperature Bridges, Multichannel Temperature Bridges, Thermocouple Reference Junctions, Temperature Telemeters, On-Off Temperature Controllers, Differential Temperature Switches, Temperature Proportional Controllers, Temperature Meters, Pyrometer Systems, Multichannel Digital Temperature Indicators, Digital Temperature Indicators, Temperature Indicating Systems, Temperature Indicator/Controllers, Digital Data Recorders for Temperature Measurements, Temperature Alarm Units and Recorders, Temperature Measuring Systems, Instrumentation Power Supplies, Temperature Calibration Systems, and Calorimeters (Int. Cl. 9).
First use in or before December 1960 on temperature transducers.

SN 253,802. Temtech, Inc., Santa Ana, Calif. Filed Sept. 2, 1966.

TEMTECH

For Temperature Transducers—Namely, Resistance Temperature Transducers, Voltage Temperature Transducers, Thermistor Temperature Transducers, Thermocouple Temperature Transducers, Thermowells, Thermowell Assemblies, Temperature Sensor Heaters; and Electronic Instruments, Devices, and Systems for Use With Temperature Transducers—Namely, Signal Conditioners for Resistance Temperature Transducers, Signal Conditioners for Resistance Strain Gauges, Signal Conditioners for Thermocouples, Signal Conditioners for Signal Conditioning Amplifiers, Temperature Bridges, Multichannel Temperature Bridges, Thermocouple Reference Junctions, Temperature Telemeters, On-Off Temperature Controllers, Differential Temperature Switches, Temperature Proportional Controllers, Temperature Meters, Pyrometer Systems, Multichannel Digital Temperature Indicators, Digital Temperature Indicators, Temperature Indicating Systems, Temperature Indicator/Controllers, Digital Data Recorders for Temperature Measurements, Temperature Alarm Units and Recorders, Temperature Measuring Systems, Instrumentation Power Supplies, Temperature Calibration Systems, and Calorimeters (Int. Cl. 9).
First use in or before March 1962 on temperature transducers.

SN 261,936. Litton Systems, Inc., Minneapolis, Minn. Filed Jan. 4, 1967.

SPARSA

For Radiosonde Electrometers for Detecting, Measuring, and Analyzing Atmospheric Electrical Signals (Int. Cl. 9).
First use on or about May 11, 1962.

SN 263,754. Electronics Systems Engineering Co., Cushing, Okla. Filed Feb. 1, 1967.

Speedmaster

For Electronic Densitometers and Electronic Neutral Density Color Analysers (Int. Cl. 9).
First use Oct. 1, 1964.

SN 265,840. National Instrument Co., Inc., Baltimore, Md. Filed Mar. 2, 1967.

Filamatic

Owner of Reg. No. 578,754.
For Vial Filling Machines That Measure Specific Quantities of Liquids, Semi-Liquids, Powders, and Paste and Then Fill Containers With the Measured Quantities (Int. Cl. 9).
First use Feb. 1, 1950.

SN 267,312. David P. Bushnell, Altadena, Calif. Filed Mar. 22, 1967.

SKY CHIEF

For Telescopes (Int. Cl. ■).
First use May 8, 1958.

SN 268,615. Renauld International, Ltd., Burlingame, Calif. Filed Apr. 7, 1967.

SHADES OF RENAULD

Owner of Reg. Nos. 777,360, 792,190, and 803,054.
For Sunglasses (Int. Cl. 9).
First use on or about Feb. 1, 1967.

SN 271,474. Isco Optische Werke GmbH, Gottingen, Germany. Filed May 15, 1967.

ISCO

Owner of Reg. Nos. 623,438 and 762,298.
For Optical Objectives (Int. Cl. 9).
First use Apr. 4, 1955; in commerce Apr. 4, 1955.

SN 271,475. Isco Optische Werke GmbH, Göttingen, Germany. Filed May 15, 1967.

ISCO

Owner of Reg. Nos. 623,438 and 762,298.
For Optical Objectives (Int. Cl. 9).
First use Apr. 4, 1955; in commerce Apr. 4, 1955.

SN 272,167. Clary Corporation, San Gabriel, Calif. Filed May 23, 1967.

CLARY

For Computers (Int. Cl. 9).
First use on or before May 13, 1958.

SN 275,704. Taisei Kogaku Kogyo Co., Ltd., Omiya-Shi, Japan. Filed July 10, 1967.

ADAPT-A-MATIC

For Interchangeable Camera Lens (Int. Cl. 9).
First use May 15, 1967; in commerce May 15, 1967.

Class 27 — Horological Instruments

SN 277,054. Les Fils de A. Donze-Baume, Les Breuleux, Switzerland. Filed July 28, 1967.

Priority claimed under Sect. 44(d) on Swiss Reg. No. 222,857, dated Feb. 1, 1967.
For Watches and Parts Thereof and Cases and Assemblies Therefor (Int. Cl. 14).

Class 28 — Jewelry and Precious-Metal Ware

SN 277,201. Oneida Ltd., Oneida, N.Y. Filed July 31,, 1967.

TERAMO

For Sterling Silver Flatware (Int. Cl. 8).
First use July 5, 1967.

SN 277,203. Oneida Ltd., Oneida, N.Y. Filed July 31, 1967.

DOVER

For Sterling Silver Flatware (Int. Cl. 8).
First use July 5, 1967.

SN 277,470. Peer Jewelry Mfg. Corp., Mineola, N. Y. Filed Aug. 3, 1967.

For Charms, Bracelets, Cufflinks, Pendants, Pins, Earrings, and Other Items of Jewelry (Int. Cl. 14).

Spee Dee Sales Co., Walnut Creek, Calif. 726,423, canc. Cl. 12.
Springer-Penguin, Inc., Mount Vernon, N.Y. 845,443, pub. 12–19–67. Cl. 32.
Standard Brands Inc., New York, N.Y. 845,479, pub. 12–19–67. Cl. 38.
Standard Milling Co.: *See*—
Wheatena Corp., The.
Standard Oil Co. of New Jersey, Wilmington, Del., to Humble Oil & Refining Co., Houston, Tex. 240,409, ren. 3–5–68, Cl. 6.
Star Brush Mfg. Co., Inc., Boston, Mass. 726,499, canc. Cl. 29.
Star Pin Co., The: *See*—
De Long Hook & Eye Co., The.
Statitrol Corp., Denver, Colo. 845,319, pub. 12–19–67. Cl. 21.
Statni Divadelni Studio, Prague, Czechoslovakia. 845,628, pub. 12–19–67. Cl. 107.
Stauffer Chemical Co., New York, N.Y. 845,530, pub. 12–19–67. Cl. 42.
Steam-O-Matic Corp., The, Sedalia, Mo. 726,512, canc. Cl. 34.
Sterling Drug Inc., New York, N.Y. 845,253, pub. 12–19–67. Cl. 6.
Sterling Merchandise Co., Akron, Ohio. 845,435, pub. 12–19–67. Cl. 28.
Sternco Industries, Inc., Allendale, N.J. 845,310, pub. 12–19–67. Cl. 23.
Strandwound Burgess Fiberglass Pipe & Products: *See*—
Burgess, Lawrence W.
Sun Oil Co., Philadelphia, Pa. 435,621, ren. 3–5–68. Cl. 21.
Supply Service, Inc., Hutchinson, Kans. 726,484, canc. Cl. 26.
Sure Crop Chemical Co.: *See*—
Couch, Arthur F.
Swimaster: *See*—
West Coast Chemicals & Solvents Corp.
Synterra Corp., Sacramento, Calif. 845,283, pub. 12–19–67. Cl. 12.
T.M.C. Power Distribution, Inc., Alexandria, Va. 845,314, pub. 12–19–67. Cl. 21.
Tami Sportswear, San Francisco, Calif. 845,506, pub. 12–19–67. Cl. 39.
Target Stores, Inc., Minneapolis, Minn. 845,615, pub. 12–19–67. Cl. 101.
Tasker Instruments Corp., Van Nuys, Calif. 726,483, canc. Cl. 26.
Tectronics Mfg. Corp., Bremen, Ind. 845,426, pub. 12–19–67. Cl. 26.
Telan Corp., Denver, Colo. 845,540, pub. 12–19–67. Cl. 44.
Telemation, Inc., Salt Lake City, Utah. 845,411, pub. 12–19–67. Multiple Class (Classes 26, 101, and 103).
Tel-Go Mfg. Corp., Houston, Tex. 726,473, canc. Cl. 23.
Ten Bosch, M., Inc., Pleasantville, N.Y. 726,452, canc. Cl. 21.
Tenneco Oil Co., Houston, Tex. 845,614, pub. 12–19–67. Cl. 101.
Tennessee Squire Association, The, Lynchburg, Tenn. 845,606–7, pub. 12–19–67. Cl. 100.
Tennessee Walking Horse Co., Turkey Creek, Tenn. 845,579, pub. 12–19–67. Cl. 49.
Terri-Cord Mills, Inc., to Advance Glove Mfg. Co., Detroit, Mich. 720,390, Am. 7(d). Cl. 39.
Tessaro, Santo, d.b.a. Calzaturificio di Santo Tesarro, and Calzaturificio di Sante Tessaro, Treviso, Italy. 845,338, pub. 12–19–67. Cl. 22.
Textron Inc., Rochester, N.Y. 845,419, pub. 12–19–67. Cl. 26.
Thames Industries Ltd., London, England. 845,658–9, Cl. 52.
Thexton Mfg. Co., Hopkins, Minn. 845,429, pub. 12–19–67. Cl. 26.
Tipp-Ex Vertrieb G.m.b.H., & Co. K.G., Frankfurt am Main, Germany. 845,261, pub. 12–19–67. Multiple Class (Classes 6 and 37).
Toenjes, Alois A., d.b.a. The Exodust Co., Los Angeles, Calif. 845,262, pub. 11–14–67. Cl. 6.
Tornado-France, Paris, France. 726,504, canc. Cl. 31.
True-Trace Corp., El Monte, Calif. 845,386, pub. 12–19–67. Cl. 23.
Unichem Inc., Greenville, N.C. 845,595, pub. 12–19–67. Cl. 52.
Union Metal Mfg. Co.: *See*—
Huenfeld Co., The.
Uniroyal, Inc., New York, N.Y. 845,245, pub. 12–19–67. Cl. 6.
Uniroyal, Inc., New York, N.Y. 845,513, pub. 12–19–67. Cl. 39.
U.S. Plywood-Champion Papers Inc., New York, N.Y. 841,897, cor. Cl. 12.
U.S. Plywood-Champion Papers Inc., New York, N.Y. 845,284–5, pub. 12–19–67. Cl. 12.
U.S. Rice Export Development Association, to Rice Council for Market Development, Houston, Tex. 789,515. Am. 7(d). Cl. A.
United States Rubber Co., New York, N.Y. 726,546, canc. Cl. 42.
United States Steel Corp.: *See*—
American Steel & Wire Co. of New Jersey, The.
University of Miami, d.b.a. University of Miami, Coral Gables, Fla. 845,632, pub. 12–19–67. Cl. 200.
University of Miami, The: *See*—
University of Miami.
Utica Knife & Razor Co., Utica, by Philip Morris Inc., d.b.a. American Safety Razor Co., New York, N.Y. 236,033, 12(c) pub. 3–5–68. Cl. 23.
Valley Chemical Co., Greenville, Miss. 845,254, pub. 12–19–67. Cl. 6.
Vanda Cosmetics Co.: *See*—
Rexall Drug & Chemical Co.
Van-L, Ltd., Green Bay, Wis. 845,422, pub. 12–19–67. Cl. 26.
Varney Chemical Corp., Janesville, Wis. 845,246–7, pub. 12–19–67. Cl. 6.
Vaughn, Inc., Memphis, Tenn. 726,414, canc. Cl. 6.
Vega, Garcia y, Inc.: *See*—
Bayuk Cigars Inc.
Video Industries Co.: *See*—
Simons, Sylvan.
Viking Freight Co., St. Louis, Mo. 845,623, pub. 12–19–67. Cl. 105.
Virginia Industries, Inc., Philadelphia, Pa. 845,368, pub. 12–19–67. Cl. 23.
Vitamins & Pharmaceuticals, Inc., to Bristol Laboratories Inc., Dover, Del., to Bristol-Myers Co., New York, N.Y. 435,965, ren. 3–5–68 Cl. 18.
Vichek Plastics Co., Middlefield, Ohio. 845,229, pub. 12–19–67. Cl. 2.
Vornado, Inc., Garfield, N.J. 845,341, pub. 12–19–67. Cl. 22.
W & J Sales Co., Salt Lake City, Utah. 704,924, canc. Cl. 22.
Wagner, John, Assoc.: *See*—
Wagner, John B.
Wagner, John B., d.b.a. John Wagner Assoc., Walnut Creek, Calif. 845,289, pub. 12–19–67. Cl. 13.
Wall, E. T., Grower Shipper: *See*—
McDermot & Wall.
Warner & Swasey Co., The, Cleveland, Ohio. 845,365, pub. 12–19–67. Cl. 23.
Warren Featherbone Co., The, Gainesville, Ga. 726,522, canc. Cl. 39.
Washington, Martha, Kitchens, Inc.: *See*—
Sheetz, Elie.
Weck, Edward, & Co., Inc., Brooklyn, by Edward Weck & Co., Inc., Long Island City, N.Y. 434,777, 12(c) pub. 3–5–68. Cl. 44.
West Coast Chemicals & Solvents Corp., d.b.a. Swimaster, Los Angeles, Calif. 726,464, canc. Cl. 22.
Westbury Fashion, Inc., New York, N.Y. 845,509, pub. 12–19–67. Cl. 39.
Western Candy Co.: *See*—
Market Confections, Inc.
Wheatena Corp., The, Rahway, N.J., to Standard Milling Co., Kansas City, Mo. 500,070, ren. 3–5–68. Cl. 46.
Whuts, Inc., Orem, Utah. 845,557, pub. 11–7–67. Cl. 46.
Wieman, John, Holly: *See*—
Erickson, Archie M.
Williams, Geo. L., Co., The, Cleveland, Ohio. 235,526, Am. 7(d). Cl. 6.
Williams Products, Inc., Hazel Park, Mich. 845,280, pub. 10–10–67. Cl. 12.

Wilson, James F., d.b.a. Elastrator Co., to Elastrator Patents, Inc., Davis, Calif. 435,697, ren. 3–5–68. Cl. 44.
Wisconsin Wire Works, Appleton, Wis. 726,426, canc. Cl. 13.
Wolf, Jacques, & Co., Newark, N.J. 726,408, canc. Cl. 6.
Wolf, John, Textiles, Inc., New York, N.Y. 726,550, canc. Cl. 42.
Wood Conversion Co.: *See*—
Conwed Corp.
Woodford Mfg. Co., Des Moines, Iowa. 845,580, pub. 12–19–67. Cl. 50.
World Carpet Mills, Inc., to World Carpets, Inc., Dalton, Ga. 787,616, Am. 7(d). Cl. 42.
Wright, Barry, Corp., Watertown, from Mathatronics, Inc., Waltham, Mass. 845,412, pub. 12–19–67. Cl. 26.
Wyatt Mfg. Co., Inc., The, Salina, Kans. 845,392, pub. 12–19–67. Cl. 23.
Wypit Co.: *See*—
Snella, Lyla H.
Yakima Bait Co., Granger, Wash. 845,350–1, pub. 12–19–67. Cl. 22.
Yardley of London, Inc., Totowa, N.J. 845,589, pub. 12–19–67. Cl. 51.
Yates, Donald N., Gibsonia, Pa. 845,581, pub. 12–19–67. Cl. 50.
Yazaki Corp., Tokyo, Japan. 845,303, pub. 12–19–67. Multiple Class (Classes 19, 21, 26, and 27).
Z & T Importing Co., Inc., City of Commerce, Calif. 845,333, pub. 12–19–67. Cl. 21.
Zevo, Inc., Los Angeles, Calif. 845,561, pub. 12–19–67. Cl. 46.
Zip Hosiery Co., Cincinnati, Ohio. 845,515, pub. 12–19–67. Cl. 39.
Ziv Steel & Wire Co., Chicago, Ill. 845,295, pub. 12–19–67. Cl. 14.
Zupp, Arlene, Mentor, Ohio. 845,626, pub. 12–19–67. Cl. 107.

PATENTS

NOTICES

Board of Appeals Decisions Rendered in the Month of January 1968

Examiner affirmed	203
Examiner affirmed in part	30
Examiner reversed	58
Total	291

Patents Available for Licensing or Sale

3,073,919. LAPSED TIMER. Mendel M. Brown, Star Mill Acres, Route 52, Hopewell Junction, N.Y., 12533.

3,195,125. TELEVISION AID TO AIRCRAFT INSTRUMENT LANDING. Henry Reitler, P.O. Box 785, Nashville, Tenn., 37209.

3,347,220. DETACHABLE AIR BLOWER FOR HOUSEHOLD BARBECUE. Salvatore Barbera, 28611 Venus St., Hayward, Calif., 94544.

3,350,866. AUTOMATIC LAWN TONGS. Thomas A. Spencer, 337 Manhattan Ave., Daytona Beach, Fla., 32018.

3,364,507. CRADLE. Nicholas Andersen, 2631 N. Roosevelt St., Arlington, Va., 22207.

3,364,775. VARIABLE RATIO TRANSMISSION. William G. Sack, 9410 S. Avers Ave., Evergreen Park, Ill., 60642.

The following 3 patents are offered by: James M. Hood, 331 W. 34th St., Houston, Tex., 77018.

2,757,062. RECORDING AND INDICATING APPARATUS.

2,757,364. METER AND APPARATUS FOR READING THE SAME.

3,106,895. MIXERS.

Eastman Kodak Company announces that, in accordance with its policy, nonexclusive licenses upon reasonable terms are available to responsible domestic applicants (under the circumstances prevailing at the time) under the following patent.

This offer is consistent with the present practice of Eastman Kodak Company to grant such nonexclusive licenses for any of its unexpired United States Patents on photographic inventions issued prior to 1963 and on inventions made in the course of research or development work for the U.S. Government.

Applications for license may be addressed to the Director, Patent Department, Eastman Kodak Company, 343 State St., Rochester, N.Y., 14650.

3,016,306. YELLOW FILTER LAYERS FOR MULTILAYER PHOTOGRAPHIC COLOR ELEMENTS.

General Electric Company is prepared to grant nonexclusive licenses under the following 94 patents upon reasonable terms to domestic manufacturers.

Applications for license under the following patent may be addressed to: Patent Counsel, Metallurgical Products Department, General Electric Company, Box 237 GPO, Detroit, Mich., 48232.

3,358,089. MAGNET ASSEMBLY.

Applications for license under the following patent may be addressed to: Division Patent Counsel, Power Transmission Division, General Electric Company, 6901 Elmwood Ave., Philadelphia, Pa., 19142.

3,362,908. ELECTRICAL APPARATUS AND DIELECTEIC MATERIAL THEREFOR.

Applications for license under the following patent may be addressed to: Patent Counsel, Wire and Cable Department, Construction Materials Division, General Electric Company, 1285 Boston Ave., Bridgeport, Conn., 06602.

3,362,924. CURABLE COMPOSITIONS COMPRISING POLYETHYLENE, PEROXIDE AND PARTICULATE CALCIUM CARBONATE WITH CALCIUM STEARATE.

Applications for license under the following 6 patents may be addressed to: Patent Counsel, General Electric Company, Wiring Device Department, 95 Hathaway St., Providence, R.I., 02904.

D.175,007. ELECTRIC WALL LAMP.

D.176,835. COLOR SLIDE VIEWER.

D.186,074. FEED-THROUGH SWITCH.

D.204,303. PORTABLE AUTOMOBILE SPOTLIGHT.

D.208,917. INTEGRALLY HINGED WEATHERPROOF RECEPTACLE COVER.

3,360,766. STRAIN RELIEF CABLE CLAMP.

Applications for license under the following 85 patents may be addressed to: Patent Counsel, Electronic Components Division, General Electric Company, 316 E. 9th St., Owensboro, Ky., 42301.

2,961,569. ELECTRIC DISCHARGE DEVICE ELECTRODE CONNECTION.

2,997,583. SYSTEM FOR HETERODYNE MIXING.

3,013,328. METHOD OF FORMING A CONDUCTIVE FILM.

3,022,440. ELECTRIC DISCHARGE DEVICE AND METHODS OF MANUFACTURE.

3,041,126. ELECTRIC DISCHARGE DEVICE AND METHOD OF MAKING.

3,041,209. METHOD OF MAKING A THERMIONIC CATHODE.

3,045,289. METHODS FOR PREPARING THIN SHEETS FROM POWDER MATERIAL.

3,048,313. AUTOMATIC WIRE-BREAKING DEVICE.

3,048,726. ELECTRON DISCHARGE RECTIFIER.

3,049,214. ELECTRON TUBE ASSEMBLY APPARATUS.

3,067,911. ARTICLE HANDLING APPARATUS.

3,076,117. PARAMETRIC ENERGY CONVERTER.

3,080,498. ELECTRODE AND METHOD OF PREPARING THE SAME FOR ELECTRON DISCHARGE DEVICES.

3,082,339. ELECTRIC DISCHARGE DEVICE.

3,091,028. METHOD AND ALLOY FOR BONDING TO NON-METALLIC REFRACTORY MEMBERS.

3,092,749. ELECTRON DISCHARGE DEVICE.

New Applications Received During January 1968

Patents	7337
Designs	391
Plant Patents	5
Reissues	33
Total	7776

Issue—March 12, 1968

Patents	1042	No. 3,372,401 to No.	3,373,442, incl.
Designs	67	No. 210,443 to No.	210,509, incl.
Plant Patents	2	No. 2,800 to No.	2,801, incl.
Reissues	5	No. 26,361 to No.	26,365, incl.
Total	1116		

3,095,324. METHOD FOR MAKING ELECTRICALLY CONDUCTING FILMS AND ARTICLE.

3,100,339. METHOD OF MAKING COMPOSITE BODIES.

3,113,846. TITANIUM CERAMIC COMPOSITE BODIES.

3,116,427. ELECTRON TUNNEL-EMISSION DEVICE UTILIZING AN INSULATOR BETWEEN TWO CONDUCTORS EITHER OR BOTH OF WHICH MAY BE SUPERCONDUCTIVE.

3,132,277. ELECTRON DISCHARGE DEVICE.

3,138,228. COMPOSITE BODIES AND METHOD OF MAKING.

3,141,225. METHOD OF SEALING A METAL TUBULATION.

3,151,265. ANODE ELECTRODE FOR ELECTRON DISCHARGE DEVICES AND METHOD OF MAKING THE SAME.

3,154,711. ELECTRON BEAM FOCUSING BY MEANS OF CONTACT DIFFERENCES OF POTENTIAL.

3,164,741. ELECTRON DISCHARGE DEVICE HAVING AN ANODE WITH IMPROVED THERMAL EXPANSION CHARACTERISTICS.

3,168,953. ELECTRON TUBE PACKAGE.

3,171,519. SEAL CONSTRUCTION.

3,173,014. ELECTROLUMINESCCENT QUENCHING OF A PHOTOCONDUCTOR THROUGH A SUBSTRATE.

3,173,779. SEALING AND COATING GLAZE.

3,192,610. METHOD OF MAKING AN ELECTRON TUBE TERMINAL.

3,193,716. CAGE CONSTRUCTION FOR ELECTRON DISCHARGE DEVICES.

3,194,475. CARTON.

3,196,306. EXHAUST TUBULATION SEAL HAVING A REDUCED WIDTH.

3,196,307. ELECTRON DISCHARGE DEVICE WITH GRID WIRE TENSIONING MEANS AND METHOD.

3,200,283. RUGGEDIZED CATHODE MOUNT.

3,202,860. ELECTRON DISCHARGE DEVICE.

3,202,867. HIGH FREQUENCY ENERGY APPARATUS WITH INTERLEAVED LADDER LINE SLOTS.

3,205,392. BRILLOUIN BEAM FORMING APPARATUS.

3,205,399. SLOW WAVE TRANSMISSION LINE.

3,205,462. LOW-LOSS WAVEGUIDE FOR PROPAGATION OF H WAVE.

3,206,329. INSULATION COATING FOR INDIRECTLY HEATED CATHODE HEATERS.

3,206,635. ELECTRON STREAM FOCUSING.

3,207,940. ELECTRON DISCHARGE DEVICE WITH PLANAR ELECTRODES.

3,210,592. FRAME GRIDS.

3,213,318. BIMETALLIC FILAMENT POSITIONING DEVICE.

3,214,629. SOLID-STATE ELECTRON SOURCE.

3,214,632. LOW NOISE ELECTRON GUN.

3,215,884. CATHODE SUPPORT.

3,217,203. BEAM PLATE STRUCTURE HAVING SUPPRESSOR GRID CHARACTERISTICS.

3,227,914. LADDER TYPE SLOW WAVE STRUCTURE HAVING SIDE PLATES AT AN ANGLE OTHER THAN 90°.

3,231,770. ELASTIC WAVE RESPONSIVE APPARATUS.

3,237,134. MICROWAVE FILTER.

3,238,405. MOUNT ASSEMBLY FOR ELECTRON DISCHARGE DEVICE.

3,239,322. PROCESS FOR SEALING VACUUM-TIGHT SPINEL BODIES.

3,252,039. ELECTRIC DISCHARGE DEVICE.

3,258,639. LADDER TYPE DELAY HAVING RUNGS OF DIFFERENT WIDTHS.

3,259,759. LAMINATED ELECTRONIC DEVICES IN WHICH A TUNNELING ELECTRON PERMEABLE FILM SEPARATES OPPOSED ELECTRODES.

3,259,786. UNDULATING BEAM ENERGY INTERCHANGE DEVICE.

3,263,299. ASSEMBLY METHOD FOR ELECTRON DISCHARGE DEVICES.

3,263,710. APPARATUS AND METHOD FOR FABRICATING FRAME GRIDS.

3,264,507. ELECTRIC DISCHARGE DEVICE STRUCTURE HAVING SEPARATE HEATER AND DISCHARGE COMPARTMENTS.

3,265,919. ELECTRIC DISCHARGE DEVICE WITH IMPROVED ELECTRODE SUPPORT.

3,265,200. PACKAGING DEVICE.

3,270,391. ELECTRON DISCHARGE DEVICE ASSEMBLY AND METHOD FOR MANUFACTURE THEREOF.

3,271,706. MICROWAVE FILTER.

3,285,687. GETTERING APPARATUS.

3,290,170. OXIDATION-RESISTANT COATING METHOD AND COATED ARTICLE.

3,292,112. TWO SIDED SLOW WAVE TRANSMISSION CIRCUIT HAVING A SELECTIVE MODE COUPLER.

3,293,478. TRAVELING WAVE TUBE WITH LONGITUDINAL RECESS.

3,295,937. TITANIUM CERAMIC COMPOSITION BODIES.

3,297,902. ELECTRON DISCHARGE DEVICE HAVING A LAMINATED AND FINELY RETICULATED GRID STRUCTURE THEREIN.

3,299,309. ANNULAR CATHODE ELECTRODE SUPPORT.

3,309,561. COAXIAL MULTIPACTOR SWITCH UTILIZING MAGNETIC FIELD TO CONTROL IMPEDANCE.

3,320,463. ELECTRON DISCHARGE TUBE HAVING AN IMPROVED ELECTRODE MOUNTING STRUCTURE.

3,323,072. BROAD BAND CIRCUITS.

3,323,073. BROAD BAND CIRCUITS.

3,328,619. AIDING MAGNETS FOR MINIMIZING LENGTH OF REVERSAL ZONE.

3,334,263. HIGH FREQUENCY ELECTRON DISCHARGE DEVICE HAVING A GROOVED CATHODE AND ELECTRODES THEREFOR.

3,334,264. BEAM FOCUSING MAGNET SYSTEM.

3,348,169. CONTROLLABLE MICROWAVE IMPEDANCE UTILIZING MULTIPACTION.

3,349,346. RECTANGULAR TO CIRCULAR WAVEGUIDE TRANSITION.

3,353,056. ELECTRON BEAM FOCUSING SYSTEM INCLUDING A MAGNETICALLY PERMEABLE SHIELD ENCLOSING THE ELECTRON GUN PERMANENT MAGNET.

3,353,123. MICROWAVE FILTER COMPRISING ABSORBING STRUCTURES FOR REMOVING SPURIOUS WAVE ENERGY.

3,358,177. ELECTRON DISCHARGE DEVICE AND METHOD.

Disclaimers and Dedications

2,946,283.—*John J. Udry*, Van Nuys, Calif. METHOD AND APPARATUS FOR PERFORATING WELLBORES AND CASINGS. Patent dated July 26, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Borg-Warner Corporation*.

Hereby disclaims and dedicates to the Public the terminal portion of the term of the patent subsequent to Dec. 31, 1966.

2,947,250.—*Henry H. Mohaupt*, Swampscott, Mass. SHAPED CHARGE ASSEMBLY AND GUN. Patent dated Aug. 2, 1960. Disclaimer and dedication filed Nov. 14, 1967, by the assignee, *Halliburton Company*.

DECISIONS IN PATENT AND TRADEMARK CASES

U.S. Court of Customs and Patent Appeals

IN RE HEINRICH RUSCHIG, WALTER AUMULLER, GERHARD KORGER, HANS WAGNER, JOSEF SCHOLZ, AND ALFRED BANDER

No. 8071. Decided June 22, 1967

[54 CCPA —; 379 F.2d 990; 154 USPQ 118]

1. REJECTION—CHANGE IN EXAMINER'S POSITION.

"We pass these ingenious and technical legal arguments since we prefer to say that we have considered the numerous cases relied on by appellants to support their proposition that the Patent Office cannot make this rejection [whether the claim in issue is supported by the disclosure] because many years ago an examiner ruled to the contrary and find the point lacking in merit and unsupported by authority."

2. APPEAL TO U.S. COURT OF CUSTOMS AND PATENT APPEALS—JURISDICTION—35 U.S.C. 144.

"Appellants insinuate that in our former decision in this case we found all the claims, including claim 13, patentable. Their words are, 'Presently appealed claim 13 was also indicated as allowable by this court.' They also say that this application 'was returned by this court to the Patent Office for issuance * * *.' We did neither of these things. We passed on a rejection on prior art, affirmed by the Board, found it in error, and reversed the Board decision. Nothing more. Under 35 U.S.C. 144 the only effect of our decision was to govern further proceedings in the case."

3. REJECTION—PROSECUTION REOPENED AFTER COURT DECISION—RES JUDICATA INAPPLICABLE.

"Appellants concede that the Patent Office can reopen a case returned by this court after appeal and reject claims on newly found prior art and attempt to distinguish the present situation on the ground that the rejection now applied [insufficient support in the disclosure] is not based on the newly found art but on the specification which has been available since the application was filed. Further, they say the very question was adjudged in their favor long ago. We are unable to see that these differences have legal significance. See *In re Citron*, 51 CCPA 869, 326 F.2d 418, 140 USPQ 220. For related views on res judicata as applied to patent prosecution see our recent opinions in *In re Herr*, 54 CCPA —, — F.2d —, 153 USPQ 548. We hold the Patent Office had the jurisdiction and the authority to reopen prosecution and to reject claim 13 on a new ground, to the merits of which rejection we now pass."

4. APPLICATION—DISCLOSURE—SUFFICIENCY OF DISCLOSURE—COMPOUND—IN RE PETERING DISTINGUISHED.

"The *Petering* case is used for its finding that a particular reference disclosure of a subgeneric class of compounds to the number of only 20, some of which were disclosed by name, was as good as *prior art* disclosure of all 20 as though they had all been named, for the purpose of anticipating an invention, not for the purpose of disclosing it to *support* a claim. As we said in our prior opinion in this case, '*Petering* involved a very special situation * * *.' We do not consider the facts here to be sufficiently similar to make it pertinent. It is not our view that a disclosure such as that to be found in the formula and words of claim 2, above, amounts to a disclosure, sufficient to support a specific claim, of every compound a skilled chemist can see is within the scope of that claim. Specific claims to single compounds require reasonably specific supporting disclosure and while we agree with the appellants, as the Board did, that *naming* is not essential, something more than the disclosure of a class of 1000, or 100, or even 48, compounds is required. Surely, given time, a chemist could name (especially with the aid of a computer) all of the half million compounds within the scope of the broadest claim, which claim is supported by the broad disclosure. This does not constitute support for each compound individually when separately claimed."

5. SAME—SAME—SAME—35 U.S.C. 112.

"Appellants refer to 35 U.S.C. 112 as the presumed basis for this rejection and emphasize language therein about *enabling* one skilled in the art to make the

invention, arguing therefrom that one skilled in the art would be enabled by the specification to make chlorpropamide. We find the argument unpersuasive for two reasons. First, it presumes some motivation for wanting to make the compound in preference to others. While we have no doubt a person so motivated would be enabled by the specification to make it, this is beside the point for the question is not whether he would be so enabled but whether the specification discloses the compound to him, specifically, as something appellants actually invented. We think it does not. Second, we doubt that the rejection is truly based on section 112, at least on the parts relied on by appellants. If based on section 112, it is on the requirement thereof that 'The specification shall contain a written description of the *invention* * * *.' [Emphasis ours.] We have a specification which describes appellants' invention. The issue here is in no wise a question of its compliance with section 112, it is a question of *fact: Is the compound of claim 13 described therein?* Does the specification convey clearly to those skilled in the art, to whom it is addressed, in any way, the information that appellants invented that specific compound? Having considered the specification in the light that has been shed on it by all the arguments pro and con, we conclude that it does not."

AFFIRMED.

Eugene O. Retter, *John Kekich* (*Sidney W. Russell*, of counsel) for appellants.

Joseph Schimmel for the Commissioner of Patents.

Before WORLEY, *Chief Judge*, RICH, SMITH, and ALMOND, *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK [1]

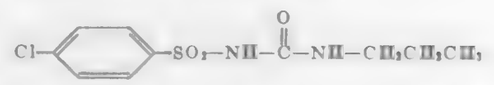
RICH, *J.*, delivered the opinion of the court.

This appeal is from the decision of the Patent Office Board of Appeals affirming the rejection of claim 13 of application Serial No. 601,107, filed July 31, 1956, for "New Benzene Sulfonyl Ureas and Process for Their Preparation." Apparently The Upjohn Company has been prosecuting the application.

This case is a sequel to our decision in *In re Ruschig*, 52 CCPA 1238, 343 F.2d 965, 145 USPQ 274, decided April 22, 1965. There we reversed a rejection of twelve claims of this same application based on prior art. The claim on appeal is one of those claims. It reads:

13. N-(p-chlorobenzenesulfonyl)-N'-propylurea.

That compound is structurally identified as



It is known by the generic name chlorpropamide and is sold under the trademark Diabinese by Chas. Pfizer & Co., Inc., as an oral medication for the control of diabetes mellitus, as more fully explained in our previous opinion, wherein we also had occasion to discuss the claim 13 compound which is again before us. We refer to that opinion for a more complete exposition of the chemical nomenclature and further background.

The sole issue on this appeal is whether claim 13 is supported by the disclosure of appellants' application, a question which had not been raised in this case at the time of the prior appeal. The following events gave rise to the issue.

About a year after the present application was filed, the Examiner suggested claim 13 to applicants for purposes of interference with a Pfizer application filed by McLamore, Serial No. 660,064 of May 20, 1957, and September 25, 1957, the claim was added. Interference 89,091

[1] Senior District Judge, Eastern District of Pennsylvania, sitting by designation.

was declared and in it McLamore moved to dissolve on the ground, inter alia, that the claim was not supported in the application at bar. The Examiner held the claim was supported and denied the motion. On reconsideration, he adhered to his decision. (The suggestion of the claim and these two decision on motions are referred to by appellants as three rulings in their favor by the Patent Office, nearly ten years ago, on the present issue.) Later the Examiner dissolved the interference on his own motion on the ground claim 13 was unpatentable to the interference parties over prior art. Meanwhile both appellants and McLamore had filed divisional applications claiming methods of treating diabetes and compositions therefor, appellants' application being Serial No. 185,865, filed April 9, 1962. It had two sets of claims, 1–4 for tablets and 5–8 for method of treatment. Claims 3 and 7 specified the same compound as that of claim 13. These claims were under rejection by reason of one-year statutory bars which could be overcome only by reliance on the filing date of the present parent application which gave rise to the question whether the application contained support for the claims. In an appeal to the board in application 185,865, by an opinion of March 4, 1965, the Board, having gone into the application and interference history, held that claims 3 and 7 in that application did not have support in the present application because the claim 13 compound is not disclosed therein and issued a new rejection under Rule 196(b) on that ground.[2]

After our decision on the prior appeal, in which we reversed the rejection on prior art, the application was returned to the Examiner. Since he knew of the Board's action in the other application holding that the disclosure does not support the compound of claim 13, he requested and obtained from the First Assistant Commissioner authorization to reopen the case to reject claim 13 on the new ground of lack of support, which he did on June 15, 1965, as follows:

> In view of the decision of the Board of Appeals of March 4, 1965 in Serial No. 185,865, holding that claims 3 and 7 therein were not supported by the disclosure of the instant case and hence not entitled to the benefit of the date thereof, claim 13 herein which is specific to a compound, the use of which is recited in claims 3 and 7, supra, is rejected as having no specific support in this disclosure for reasons fully detailed in said decision (Appeal No. 283—74), Paper No. 25, at pages 4–7. The compound of claim 13 is not named or identified by formula and it can find support only as choices made between the several variables involved. This is not regarded as adequate support for a specific compound never named or otherwise exemplified in the specification as filed. See *In re Fried* 1963 C.D. 248 (page 257, first paragraph [50 CCPA 954, 312 F.2d 930, 136 USPQ 729]).

Appellants then argued this rejection before the Examiner who adhered to it and made it final. Reconsideration was requested and given, the Examiner adhering to his view. Appellants then took the question to the Board where the Examiner filed an extensive answer to their lengthy brief. The Board affirmed for very much the same reasons as those stated in its opinion in deciding the same issue in application Serial No. 185,865. Thus the question before us has been twice decided adversely to appellants by the Board of Appeals, the same panel hearing both appeals.[3]

[2] The Board opinion is reported at 147 USPQ 46. After receiving it, appellants cancelled claims 3 and 7 from application 185,865 and Patent No. 3,198,706 was issued thereon, Aug. 3, 1965, to the assignee Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning.

[3] Federico and Rosa, Examiners-in-Chief, and Stone, Acting Examiner-in-Chief; opinions by Federico.

In coming here, appellants raise a question in addition to the issue of support which requires preliminary consideration. They say that in this second appeal "involving the *same* and already adjudicated claim, the United States Patent Office was without authority, or lacked jurisdiction, to reopen these proceedings (after the court's decision) to resurrect a ground of rejection which had already been considered by the Patent Office, this lack of authority being based upon principles of, or akin to, res judicata, estoppel or laches."

In answer, the Solicitor says there is no such issue before us since it was not raised before the Board, is raised for the first time in this court, and was not properly raised by any reason of appeal. Appellants counter with the argument that Reason of Appeal 9, reading, "The Board of Appeals erred in matters of law," will suffice. They also say that, being a matter of "jurisdiction over subject matter," it can be raised at any time.

[1] We pass these ingenious and technical legal arguments since we prefer to say that we have considered the numerous cases relied on by appellants to support their proposition that the Patent Office cannot make this rejection because many years ago an Examiner ruled to the contrary and find the point lacking in merit and unsupported by authority. We appreciate the extensive memorandum of law supplied in the appendix to appellants' brief, containing cases pro and con, and note the heavy reliance on what was said in two concurring opinions. We surmise appellants would have to agree that what precedents they have found are not, as a whole, very strong support for their theory. The words of Judge Garrett in *In re Ellis*, 24 CCPA 759, 86 F.2d 412, 31 USPQ 380, which appellants found quoted in *In re Becker*, 26 CCPA 922, 101 F.2d 557, 40 USPQ 624, fairly depict the present situation, which is not much different from that prevailing in 1936,

> There is nothing unusual, certainly, about an examiner changing his viewpoint as to the patentability of claims as the prosecution of a case progresses, and, so long as the rules of Patent Office practice are duly complied with, an applicant has no legal ground for complaint because of such change in view.

The life of a patent solicitor has always been a hard one.

[2] Appellants insinuate that in our former decision in this case we found all the claims, including claim 13, patentable. Their words are, "Presently appealed claim 13 was also indicated as allowable by this court." They also say that this application "was returned by this court to the Patent Office for issuance * * *." We did neither of these things. We passed on a rejection on prior art, affirmed by the Board, found it in error, and reversed the Board decision. Nothing more. Under 35 U.S.C. 144 the only effect of our decision was to govern further proceedings in the case.

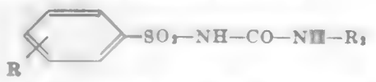
[3] Appellants concede that the Patent Office can reopen a case returned by this court after appeal and reject claims on newly found prior art and attempt to distinguish the present situation on the ground that the rejection now applied is not based on newly found art but on the specification which has been available since the application was filed. Further, they say the very question was adjudged in their favor long ago. We are unable to see that these differences have legal significance. See *In re Citron*, 51 CCPA 869, 326 F.2d 418, 140 USPQ 220. For related views on res judicata as applied to patent prosecution see our recent opinions in *In re Herr*, 54 CCPA —, — F.2d —,

153 USPQ 548. We hold the Patent Office had the jurisdiction and the authority to reopen prosecution and to reject claim 13 on a new ground, to the merits of which rejection we now pass.

We have quoted the Examiner's rejection above. His first point was that the compound of claim 13 "was not named or identified by formula" in the specification. Appellants admit this. His next point was that it "can find support only as choices made between the several variables involved." These words are the words of Judge Smith in *In re Fried*, supra, a case in which we found lack of support in general disclosures. Their purport in the factual context of this case is that the reagents for the preparation of chlorpropamide are listed, with many others, in the disclosure and, as the Board said, "If the proper choices of the three variables in the above formula are made, the compound in question is produced," the formula referred to being that of the family of benzene sulphonyl-ureas in which the variables are R, R_1 and R_2, to be seen in claim 1 reproduced in our former opinion. The Board continued its statement, saying, "but nowhere in the specification is the particular selection indicated."

It does not seem to be contested that the general disclosure of the application encompasses something like half a million possible compounds.[4] It also disclosed a number of specific compounds. Appellants' argument is that one skilled in the art would find certain "guides" in the specification which would lead him to the compound of claim 13 and that the compound is therefore disclosed. Further reliance is placed on our opinion in *In re Petering*, 49 CCPA 993, 301 F.2d 676, 133 USPQ 275, taken in connection with original claim 2, legally deemed a part of the disclosure, which appellants say encompasses only 48 compounds, "excluding isomers," this being in effect one of the "guides." Original claim 2 reads:

2. Benzenesulphonylureas of the general formula



wherein R is a member selected from the group consisting of chlorine and bromine and R_2 is a member selected from the group of alkyl-, alkenyl-, cycloalkyl- and cycloalkylalkyl radicals containing 2 to 7 carbon atoms.

Appellants refer to this formula as narrowing the field of selection, so to speak, and say that "excluding isomers," there are "approximately" 48 compounds within the scope of that claim all of which are "readily determinable by skilled chemists." What this amounts to is saying that skilled chemists can see that R is either Cl or Br and that R_2 is any one of the radicals above recited. The Examiner computes that the number of possible compounds is not approximately 48 but a minimum of 1,010, "excluding stereoisomerides." He shows his calculations and we do not find a refutation of them by appellants to justify their contention the number is 48, nor any explanation of how the number 48 is arrived at. [4] The *Petering* case is used for its finding that a particular reference disclosure of a subgeneric class of compounds to the number of only 20, some of which were disclosed by name, was as good as *prior art* disclosure of all 20 as though they had all been

[4] In the companion case of *In re McLamore* (Patent Appeal 7829), concurrently decided, a Ph. D. chemist who heads the Pfizer Patent Department has made an affidavit of record in which he shows how he has calculated, on a conservative basis, including sodium and potassium salts, the number of compounds within the broad disclosure of this application to be 1,237,464. We express no view on this mathematical question. The number is very large in any event.

named, for the purpose of anticipating an invention, not for the purpose of disclosing it to *support* a claim. As we said in our prior opinion in this case, "*Petering* involved a very special situation * * *." We do not consider the facts here to be sufficiently similar to make it pertinent. It is not our view that a disclosure such as that to be found in the formula and words of claim 2, above, amounts to a disclosure, sufficient to support a specific claim, of every compound a skilled chemist can see is within the scope of that claim. Specific claims to single compounds require reasonably specific supporting disclosure and while we agree with the appellants, as the Board did, that *naming* is not essential, something more than the disclosure of a class of 1000 or 100, or even 48, compounds is required. Surely, given time, a chemist could name (especially with the aid of a computer) all of the half million compounds within the scope of the broadest claim, which claim is supported by the broad disclosure. This does not constitute support for each compound individually when separately claimed.

Other "guides" allegedly *leading to* chlorpropamide argued by appellants will now be discussed. It is said eleven processes for making the many componds of the invention are disclosed, five of which employ an "alkylamine." This is R_2 in the general formula. But in that formula there is also the variable R which may be hydrogen, chlorine, bromine, methyl, or methoxy and R_1 which may be either chlorine or bromine and, furthermore, R and R_1 may be located anywhere on the benzene ring, that is, ortho, meta, or para to the SO_2 group and adjacent or non-adjacent one another. This makes for more than a few unidentified possibilities not determined by the use alkylamine alone. To lead to claim 13, R must be hydrogen and R_1 must be chlorine and the alkylamine, R_2, must be propylamine.

Next, it is argued in connection with these processes that in the discussion of Process (1) it is taught that the primary amine could be "*a primary butylamine or another primary alkylamine* or an alkenylamine, cyclo-alkylamine or cycloalkylalkyl-amine containing 2 to 7 or 8 carbon atoms" and that one skilled in the art could *see* that "if n-butylamine is a reactant, then ethylamine, n-propylamine, etc., are also possible reactants." We do not see that this guides one *to* the use of n-propylamine. The important words in the quotation from our point of view are "etc." and "possible." It is an old custom in the woods to mark trails by making blaze marks on the trees. It is no help in finding a trail or in finding one's way through the woods where the trails have disappeared—or have not yet been made, which is more like the case here—to be confronted simply by a large number of unmarked trees. Appellants are pointing to trees. We are looking for blaze marks which single out particular trees. We see none.

Appellants say next that the "guide" becomes more crystallized by the recitation of the alkylamines which can be employed in the four or five reactions described as using them. This list contains at least 19 primary amines which the specification says may be used. Appellants emphasize two, n-butylamine, which is elsewhere specifically disclosed as having been used, and n-propylamine. We do not see that listing the latter with the 18 others adds anything to the initial statement that one may use an alkyl amine containing from 2 to 6 carbon atoms. Propylamine is such an amine but one is not led to it in preference to the others merely by listing them all and identifying it, with the others, by name.

Finally appellants refer to two tables listing, respectively, ten and twelve specific compounds, the first being the list of specific compounds whose blood sugar lowering activity is shown in the specification, the other, which duplicates the first and adds two compounds, being the specific examples of the specification. There is no N′-n-propyl compound among them. Perhaps one of appellants' best points is that the activity table "stresses" compounds in which R_2 is a primary alkyl radical, i.e., ethyl, butyl, isobutyl and hexyl. The stress resides in the fact that eight of the ten are such compounds. And one of them, N-(4-chlorobenzenesulphonyl)-N′-n-butyl urea, is a homolog of the compound of claim 13. It must be admitted that this is getting close. *If* n-propylamine had been used in making the compound instead of n-butylamine, the compound of claim 13 would have resulted. Appellants submit to us, as they did to the Board, an imaginary specific example patterned on specific Example 6 by which the above butyl compound is made so that we can see what a simple change would have resulted in a specific supporting disclosure being present in the specification. The trouble is that there is no such disclosure, easy though it is to imagine it. It is equally easy to imagine that the compound of claim 13 might have been named in the specification. Working backward from a knowledge of chlorpropamide, that is by hindsight, it is all very clear what route one would travel through the forest of the specification to arrive at it. But looking at the problem, as we must, from the standpoint of one with no foreknowledge of the specific compound, it is our considered opinion that the Board was correct in saying:

> Not having been specifically named or mentioned in any manner, one is left to selection from the myriads of possibilities encompassed by the broad disclosure, with no guide indicating or directing that this particular selection should be made rather than any of the many others which could also be made.

[5] Appellants refer to 35 U.S.C. 112 as the presumed basis for this rejection and emphasize language therein about *enabling* one skilled in the art to *make* the invention, arguing therefrom that one skilled in the artwould be enabled by the specification to make chlorpropamide. We find the argument unpersuasive for two reasons. First, it presumes some motivation for wanting to make the compound in preference to others. While we have no doubt a person so motivated would be enabled by the specification to make it, this is beside the point for the question is not whether he would be so enabled but whether the specification discloses the compound to him, specifically, as something appellants actually invented. We think it does not. Second, we doubt that the rejection is truly based on section 112, at least on the parts relied on by appellants. If based on section 112, it is on the requirement thereof that "The specification shall contain a written description *of the invention* * * *." [Emphasis ours.] We have a specification which describes appellants' invention. The issue here is in no wise a question of its compliance with section 112, it is a question of *fact: Is the compound of claim 13 described therein?* Does the specification convey clearly to those skilled in the art, to whom it is addressed, in any way, the information that appellants invented that specific compound? Having considered the specification in the light that has been shed on it by all the arguments pro and con, we conclude that it does not.

The decision of the Board is affirmed.

AFFIRMED.

REISSUES

MARCH 12, 1968

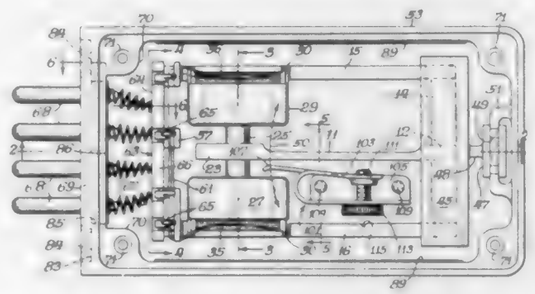
Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

26,361
ELECTROMECHANICAL FREQUENCY RESPONSIVE TRANSLATING DEVICE

Charles W. Mooney, Mount Prospect, and Alfred S. Holzinger, Chicago, Ill., assignors to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Original No. 3,221,120, dated Nov. 30, 1965, Ser. No. 341,508, Jan. 31, 1964. Application for reissue Nov. 29, 1966, Ser. No. 606,494

18 Claims. (Cl. 335—90)



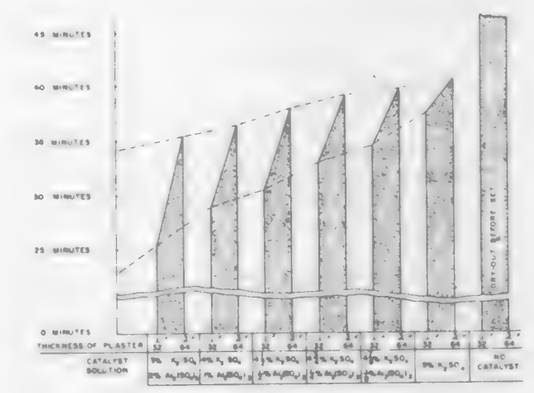
Electromechanical frequency responsive device including rectangular chassis with vibratory reed therein having one end supported on chassis and elongated permanent magnet extending transversely at the opposite end. A drive coil surrounds one end of the magnet and a pick-up coil surrounds the other end. Conductive shields are provided about the coils and conductive sleeves may be provided therein. The chassis is mounted in a frame with one end supported by conducting coil springs which provide electrical connections and the other end supported by a resilient boot which provides damping.

26,362
CATALYZED GYPSUM WALLBOARD AND METHOD OF PRODUCTION THEREOF

Mark E. Gerton, Pleasanton, Calif., assignor to Fibreboard Corporation, a corporation of Delaware

Original No. 3,284,227, dated Nov. 8, 1966, Ser. No. 242,806, Dec. 6, 1962. Application for reissue June 22, 1967, Ser. No. 653,589

5 Claims. (Cl. 117—60)



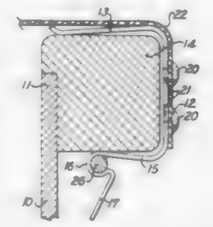
1. A method of wall construction comprising impregnating the surface of a wallboard backing with an aqueous solution of a gypsum setting catalytic agent selected from the group consisting of potassium sulphate and mixtures of potassium sulphate and aluminum sulphate, and plastering a single thin coat of gypsum plaster comprising about 15 to 30 percent inert filler, about 2 to 10 percent plasticizer clay, about 0.5 to 2% of a mixture of polyvinyl acetate and polyvinyl alcohol, and the remainder consisting essentially of gypsum, upon the catalyzed surface of said backing, and final-finishing the thin plaster coat to form a continuous plaster exterior surface.

26,363
FABRIC COVER FOR BOATS

William J. Mills II, 125 Main St., Greenport, N.Y. 11944

Original No. 3,192,542, dated July 6, 1965, Ser. No. 228,982, Oct. 8, 1962. Application for reissue Jan. 13, 1967, Ser. No. 612,754

14 Claims. (Cl. 9—1)



A cover construction with securing means therefor is provided to effectively cover the opening in a lifeboat, tender or other small boat, when the boat is not in actual use, wherein a series of resilient fastener-clips, attached to the cover, serve to hold the cover in place on the boat. It is a feature of this construction that the cover can be quickly applied or removed, as required, and that the fastener-clips on the cover require no engaging hardware or fixtures on the boat, and that the fastener-clips will not mar or damage the finish of the boat surface.

26,364
METALLURGICAL MELTING AND REFINING PROCESS

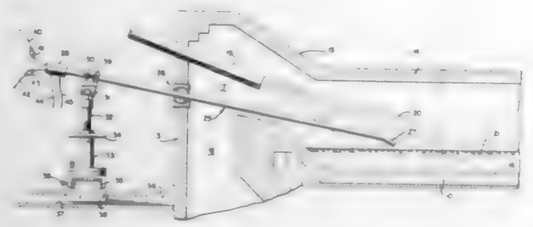
Edward F. Kurzinski, Doylestown, Pa., assignor, by mesne assignments, to Air Products and Chemicals, Inc., Trexlertown, Pa., a corporation of Delaware

Original No. 3,194,650, dated July 13, 1965, Ser. No. 101,022, Apr. 5, 1961, which is a continuation-in-part of Ser. No. 7,457, Feb. 8, 1960. Application for reissue June 21, 1966, Ser. No. 562,976

27 Claims. (Cl. 75—43)

1. The method of operating a metallurgical furnace of the open hearth type having a bottom, a roof and side walls defining a zone and having end wall burners, comprising the steps of operating the end wall burners and introducing fluid including fuel and oxygen along at least one confined path downwardly to within the zone, burning the fuel and oxygen in admixture to form a short flame beyond the end of the confined path, charging solid material including metal into the zone, operating the end wall burners and separately burning the admixture to form a short flame while charging the solid material while moving the end of the confined path to direct the short flame onto solid material beneath the confined path, adding hot molten metal to the zone upon the completion of the charging of solid material, and thereafter continuing the introduction of at least oxygen through the confined

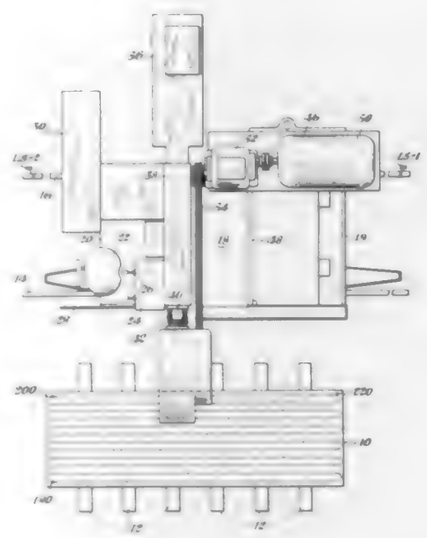
path and directing the resulting stream onto the molten metal to refine the metal of the charge.



20. A method of operating a metallurgical furnace comprising the steps of charging the furnace, introducing fluid including fuel and oxygen within the furnace along at least one confined path, the discharge end of said path being between two and four feet above the charge in the furnace, burning the fuel and oxygen in admixture to form a short, relatively high temperature flame beyond the confined path which impinges on the charged material and thereafter lowering the confined path and increasing the oxygen to fuel ratio of the mixture.

26,365
CONTROL SYSTEM FOR SURFACE APPARATUS
Clifford G. Beattie, Natrona Heights, and Victor D. Gumbert, Springdale, Pa., assignors to Allegheny Ludlum Steel Corporation, Brackenridge, Pa., a corporation of Pennsylvania
Original No. 3,149,439, dated Sept. 22, 1964, Ser. No. 295,425, July 16, 1963, which is a continuation-in-part of Ser. No. 191,997, May 2, 1962. Application for reissue May 9, 1966, Ser. No. 552,673
11 Claims. (Cl. 51—34)

Workpiece surface apparatus for grinding the entire surface of the slab wherein the grinding means is adapted for movement in two directions, the movement thereof being controlled by a first and a second motor means, the first motor means controlling the grinding means along one dimension of the workpiece and the second motor means controlling the grinding means in a direction transverse to the first direction in increments until the



entire surface is ground. Switch means are provided to be actuated at the desired limits of movement of the grinding means for controlling the distance of travel of the grinding means and additionally providing the incremental advances of the grinding means. Additional switch means are also provided for disabling the grinding apparatus where the entire surface has been ground.

PLANT PATENTS

GRANTED MARCH 12, 1968

Illustrations for plant patents are usually in color and therefore it is not practicable to reproduce the drawing.

2,800
APPLE TREE
Lewis Arends, Sparta, Mich., assignor to Hill Top Orchards and Nurseries, Inc., Hartford, Mich., a corporation of Michigan
Filed Nov. 14, 1966, Ser. No. 594,283
1 Claim. (Cl. Plt.—34)

1. A new and distinct variety of apple tree, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of a fruit ripening habit of from 2 to 3 weeks earlier than "McIntosh" (unpatented), the ability of the fruit to hang exceptionally well on the tree while having a long color rotention period with a consequent long period of suitable picking maturity, an exceptionally attractive bright red skin color of the fruit on the exposed side, combined with an attractive greenish-yellow ground color, with some streaking at the stem end or more streaking on the lesser colored fruit, an early and quite white color of the fruit flesh in the picking season, changing to a yellowish-creamy white color as the fruit fully ripens on the tree, long storage and shelf life of the fruit and excellent resistance of the foliage and fruit to apple scab fungus even without chemical treatment.

2,801
CRAB APPLE TREE
William Flemer III, Princeton, N.J., assignor to Treesearch, Kingston, N.J., a partnership
Filed Dec. 22, 1966, Ser. No. 604,076
1 Claim. (Cl. Plt.—34)

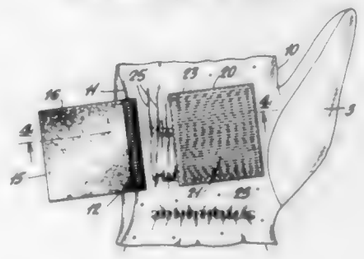
1. A new and distinct variety of flowering crab apple tree, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of good winter hardiness, with no winter dieback at terminals of twigs of young plants even when extended growing seasons produce late growth of such twigs, there being die back of such growth in other varieties and a distinctive, attractive and unusually sharp, clear Crimson Red color of the flowers, with a Scarlet overlay free from unattractive Magenta or muddy tints characteristic of other so-called red flowered crab apple varieties.

PATENTS

GRANTED MARCH 12, 1968

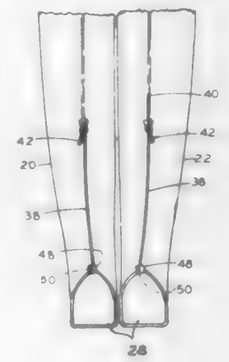
GENERAL AND MECHANICAL

3,372,401
ADJUSTABLE GOLF GLOVE
Ellis M. Woodward, 501 Surrey Road, Timonium, Md. 21093
Filed Feb. 20, 1967, Ser. No. 617,202
5 Claims. (Cl. 2—159)



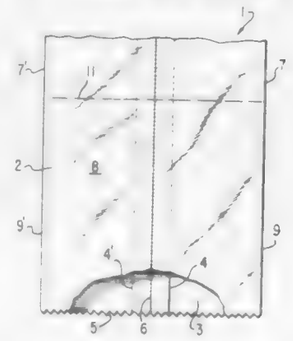
The invention contemplates a golf glove provided with an adjustable flexible and separable tightening band which extends diagonally across the back portion of the glove, and the outer ends of which are connected between the back portion adjacent to the thumb portion and the palm portion closely adjacent to the seam remote from the thumb portion. A tightening of the band throws any excess material arising from the stretching of the glove into the back portion, so that no wrinkling can take place in the palm portion, thereby leaving the latter free and smooth for an effective grasping of the golf club shaft. The readily separable tightening band includes an elastic insert to permit freedom of muscular movement in the grasping of the shaft. Velcro tape fasteners are used preferably to effect the ready engagement and disengagement of the components of the tightening bands, although other types of fasteners may be used without sacrificing all of the many advantages of the invention.

3,372,402
SKI PANTS
Adam K. Kaufmann, Camillus, N.Y.
(% Little Europe Ski Shop, Oran, N.Y. 13125)
Filed Nov. 23, 1965, Ser. No. 509,397
1 Claim. (Cl. 2—232)



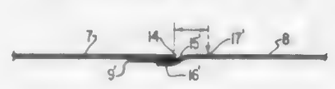
Ski pants, comprised of lengthwise stretch fabric substantially non-resilient circumferentially, the leg portions being adapted to fit the contour of a wearer's leg and ankle and having a closed heel and a frontal opening through which the wearer's foot forward of the arch may project, the leg portion at its lower end, and front center having a slide fastener extending from the opening upwardly along the front center of the leg portion to a level where the circumference of the leg portion is sufficient to permit the passage of a wearer's heel and ankle, the slide fastener being separable at its lower end and closed by movement of a connector slide upwardly from the lower end.

3,372,403
DURABLE PRESS GARMENTS AND METHOD FOR ALTERING HEMS AND CUFFS
Nelson F. Getchell, Great Falls, Va., assignor to Cotton Producers Institute, Memphis, Tenn., a corporation of Tennessee
Filed Apr. 23, 1965, Ser. No. 450,382
10 Claims. (Cl. 2—269)



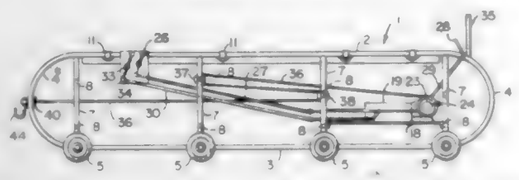
A method of making a garment which may subsequently be altered, such as a pair of trousers, from a cellulose fiber-containing fabric having a latent creaseproofing agent therein. The agent is cured on the finished garment except for a selected portion of the garment, such as the terminal portion of trouser legs. By maintaining the creaseproofing agent in a latent condition on the selected portion, such as by shielding that portion while the rest of the agent on the garment is cured, one or more pleats, folds, creases, or the like can be subsequently formed in the selected portion, such as cuffs on trouser legs, and the creaseproofing agent therein cured to impart a durable crease to all folds.

3,372,404
DURABLE PRESS GARMENTS AND METHOD FOR ALTERING SEAMS
Nelson F. Getchell, Great Falls, Va., and William R. Thomas III, Bethlehem, Pa., assignors to Cotton Producers Institute, Memphis, Tenn., a corporation of Tennessee
Filed Apr. 23, 1965, Ser. No. 450,396
10 Claims. (Cl. 2—275)



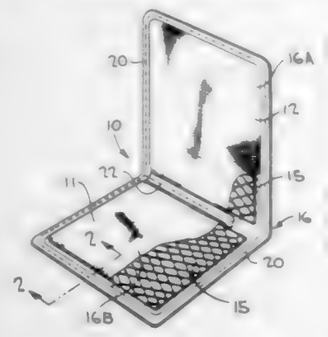
A method of making garments, such as trousers, jackets, and the like from a cellulose fiber-containing fabric, which garments have a stitched seam formed therein. After a creaseproofing agent has been cured on the garment fabric so as to impart thereto creaseproof and wrinkle-resistant properties, the garments may be subsequently altered by being let out at the seam without any durable crease or creases showing in the altered area.

3,372,405
RESCUE CARRIAGE
Emil S. Doering, Rte. 2, Box 2093, Oroville, Calif. 95965
Filed Oct. 21, 1966, Ser. No. 588,489
5 Claims. (Cl. 5—81)



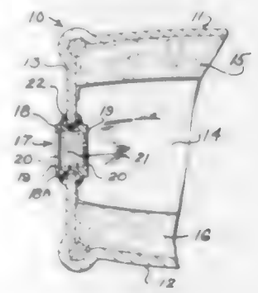
An elongated rescue carriage having a support thereon on which a prone injured person is adapted to be supported and secured, and which carriage includes ground-engaging wheels for movement over the ground or against a side of a cliff, in a direction longitudinally of the carriage. A rope connected at one end with power actuated means on the carriage is adapted to extend to a remote stationary point and power means on the carriage actuates said power actuated means for moving the carriage along the rope to said remote point.

3,372,406
VENTILATED CUSHION STRUCTURE
John E. Heckethorn, Dyersburg, Tenn., assignor to Heckethorn Manufacturing Co., Dyersburg, Tenn., a corporation of Colorado
Continuation-in-part of application Ser. No. 391,961, Aug. 25, 1964. This application Aug. 3, 1965, Ser. No. 476,866
7 Claims. (Cl. 5—347)



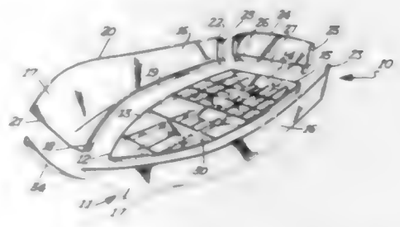
The seat spring pad or insert constituting the subject of the present invention comprises a circumferential frame of preferably rectangular configuration, made of wire of a suitably heavy gauge and of rounded cross section, together with an areal mesh fabric composed of intermeshed coils of wire of lesser gauge. The convolutions of the individual coils present, when viewed longitudinally of the coil, a substantially rectangular aspect, with the upper and lower horizontal reaches disposed approximately in flat almost uninterrupted contact with the inward surfaces of the covering fabric employed. The vertical reaches are in fact almost truly vertical so far as the longitudinal aspect of the coils is concerned and stand only at a quite limited angle to the adjacent vertical reaches of the interlocked adjoining coil. The crossed end portions of the individual wires of adjacent coils are twisted together a number of full turns to provide a tightly twisted double strand, with no flared ends, and the number of turns being adequate to provide sufficient length of the terminal strand to surround the major portion of the adjacent cross section of the large gauge frame wire, preferably with the blunt end of the strand abutting the root portion thereof. Certain novel treatment of the coil ends results in a metallic hook structure to provide a close, strong permanent bonding encirclement of the frame wire. To provide a certain degree of relative vertical movement between the coils in use in order to enhance the comfort of the cushion, the vertical reaches of the coil configurations are of substantial height, being many times greater than the diameter of the individual wires concerned, and not mere looped or radiused intersections as in the case of conventional fence or partition structures.

3,372,407
MATTRESS AND CUSHION VENTILATING AND AIR TREATMENT MEANS
Robert L. Weber III, 49 Clapboard Hill Road, New Canaan, Conn. 06840
Filed Feb. 16, 1966, Ser. No. 527,910
1 Claim. (Cl. 5—347)



A mattress having side panels with apertures arranged therein for the insertion of a cylindrical container which is treated with a deodorizing substance. As the mattress is depressed and released the deodorizing container will emit a treated scent of air to the interior of the mattress to deodorize the same.

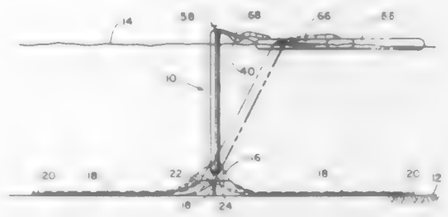
3,372,408
SECTIONAL BOAT STRUCTURE
Ormond L. Luger and Reinold J. Luger, Jr., Edina, Minn., assignors to Luger Industries, Inc., Minneapolis, Minn., a corporation of Minnesota
Filed Mar. 11, 1966, Ser. No. 533,500
3 Claims. (Cl. 9—6)



A sectional plastic boat kit including a lower section defining the bottom portion of the boat hull. A pair of side sections secured to the lower section and defining the sides of the boat. A transom section extending between and secured to the side sections and secured to the lower sections. A pair of deck sections secured to the side sections, and a channel shaped joint member overlapping and secured to the side sections. A frame structure secured to the interior surfaces of the lower and side sections to maintain a proper contour of the boat.

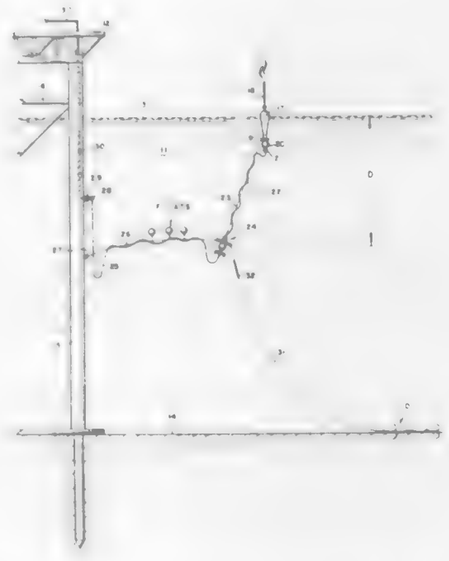
3,372,409
APPARATUS FOR TRANSPORTING FLUIDS FROM A MARINE BOTTOM TO A FLOATING VESSEL
William F. Manning, Springdale, Conn., assignor to Mobil Oil Corporation, a corporation of New York
Filed June 9, 1965, Ser. No. 462,481
4 Claims. (Cl. 9—8)

This specification discloses apparatus for transporting fluids from a flow line on the bottom of a body of water to a floating vessel on the surface and for mooring the vessel at the offshore location. Illustrated are several designs of buoyant, double-walled pipes, each anchored at the lower end thereof with its longitudinal axis substantially vertical. The annular space between the walls of the pipe is sealed



and evacuated to provide buoyancy while a central passageway within the inner wall serves as a fluid path, either to directly conduct fluid therethrough or as a support for flow lines extending therethrough so that the fluids can be transported to the vessel moored to the upper end of the buoyant pipe.

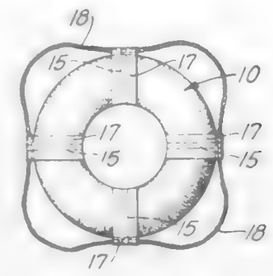
3,372,410
FLARE FOR USE IN A BODY OF WATER
Robert G. Hindman, New Orleans, and William J. Ruez III, Metairie, La., assignors to Esso Production Research Company
Filed July 11, 1966, Ser. No. 564,173
10 Claims. (Cl. 9—8.3)



A floating flare is flexibly interconnected with a platform in a body of water such that the flare is maintained a selected distance from the platform by means of several swivel or ball joints providing universal relative motion.

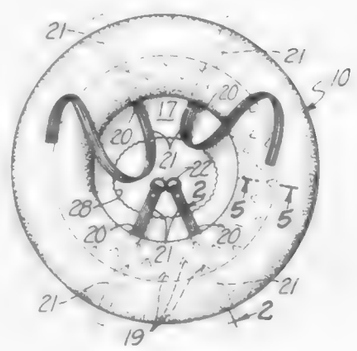
3,372,411
RING BUOY AND METHOD OF MAKING THE SAME
James H. Robertson, 5238 Vineland Ave., North Hollywood, Calif. 91601
Filed Nov. 21, 1966, Ser. No. 595,705
5 Claims. (Cl. 9—311)

A ring buoy and method of making the same in which the buoy comprises a ring formed of lightweight rigid material such as molded styrofoam, around the periphery of which a grabline is held by a plurality of spaced straps. To prevent undesirable displacement of the straps and to provide manufacturing economies and structural benefits, a plurality of holding members have one end thereof securely held in place by being molded into the ring itself



at the time the ring is formed. The other ends of the holding members project outwardly from the outer periphery of the ring and the straps and/or grabline are secured to the projecting ends of the holding members.

3,372,412
RING-SHAPED SWIMMING AID FOR CHILDREN AND METHOD OF MAKING THE SAME
James H. Robertson, 5238 Vineland Ave., North Hollywood, Calif. 91601
Filed Nov. 21, 1966, Ser. No. 595,708
6 Claims. (Cl. 9—311)



A swimming aid for children and method of making such swimming aids of the type comprising a ring formed of molded lightweight material such as polystyrene foam. Disposed within the center of the ring is a relatively thin resilient diaphragm with an opening which fits around the body of the child adjacent to the armpits. A plurality of straps are connected between the ring and the body of the child, extending over the shoulders of the child and being connected to the ring.

In order to prevent displacement of the straps and provide manufacturing economies and structural benefits, the straps are securely held to the ring by being molded into the ring at the time the ring is formed. The diaphragm in the center of the ring may also have its outer edges molded into and held by the ring. The diaphragm preferably has openings through which the straps pass. The inner edge of the body receiving opening of the diaphragm is preferably serrated, to provide a more flexible and more secure grip upon the body of the child. The portion of the diaphragm which is molded into the ring may have a plurality of cuts forming triangular portions which are displaced transversely when the ring is molded, to increase the engagement between the diaphragm and the ring.

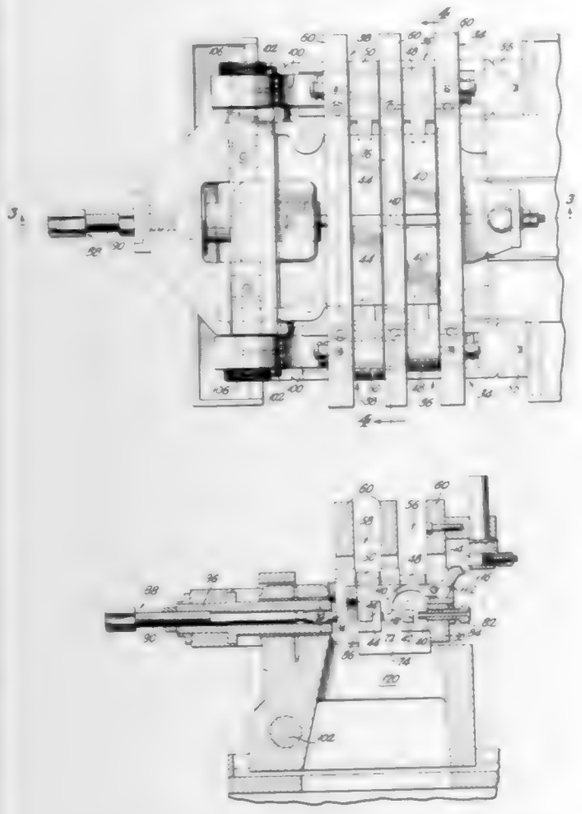
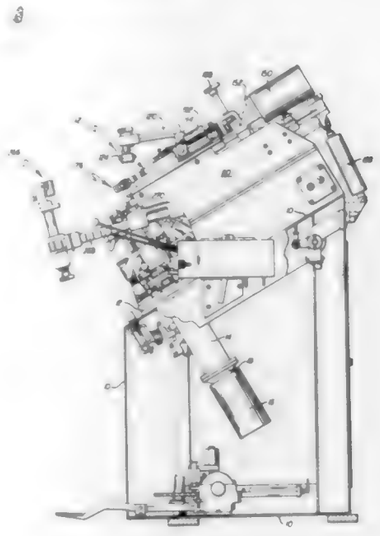
NAIL-MAKING MECHANISM AND TECHNIQUE
Douglas Stewart Faulkner, Warrington, England, assignor to The Dore Development Company, Inc., Elmhurst, N.Y., a corporation of New York
Filed Aug. 6, 1965, Ser. No. 477,920
Claims priority, application Great Britain, Aug. 15, 1964, 33,427/64
8 Claims. (Cl. 10—54)



An apparatus and method for manufacturing nails, rivets and the like, wherein a length of wire nail stock is pointed and cut by a cutting tool and then gripped by a gripping tool while a head is formed on the cut length.

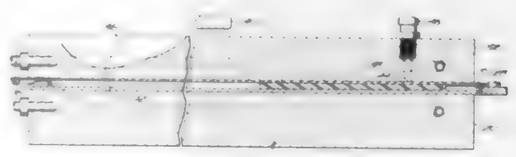
3,372,414
APPARATUS FOR LASTING SHOES
James H. Arsenault, Whitinsville, Mass., assignor to Jacob S. Kamborian, West Newton, Mass.
Filed Sept. 22, 1966, Ser. No. 581,218
8 Claims. (Cl. 12—8.2)

1. A shoe machine comprising:
means for supporting a shoe assembly in a bottom-down position, said shoe assembly including a last having a shoe upper draped thereabout;
a flexible, resilient, upwiping member having a surface thereof of a contour substantially paralleling that of a selected portion of said shoe assembly;
means mounting said upwiping member to said machine for movement between a first position wherein said upwiping member is in an out-of-the-way, remote position and a second, forward position wherein said upwiping member is in a working position that is above and in paralleling, overlapping relationship to said selected position of said shoe assembly;
means for effecting relative heightwise movement between said shoe assembly support means and said upwiping member so as to cause engagement of said selected portion of said shoe assembly with said paralleling surface of said upwiping member when said upwiping member is in said second position,
said means for effecting said relative heightwise movement being of such construction as to continue said relative heightwise movement subsequent to engagement of said shoe assembly with said paralleling surface of said upwiping member, said upwiping member effecting a pressing of said upper to said last while said relative heightwise movement of said shoe assembly and said upwiping member is being effected to thereby stretch said upper about and into conformity with said last;
a force applying instrumentality operatively connected to said upwiping member;



control means for said force applying means so constructed and arranged as to enable said force applying instrumentality to cause said upwiping member to be either in said first position or to be urged into said second, forward, working position under a first relatively low force during said relative heightwise movement of said upwiping member and said shoe assembly supporting means; and
means, operative subsequently to the completion of said relative heightwise movement, to cause said force applying instrumentality to urge said upwiping member forwardly under a second force that is greater than said first force.

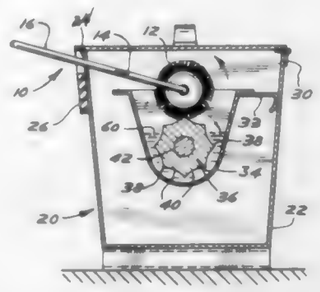
3,372,415
SHOE FORMING METHOD AND APPARATUS
Robert E. King, 104 Elm St., Georgetown, Mass. 01830
Filed Jan. 23, 1964, Ser. No. 339,745
3 Claims. (Cl. 12—142)



1. The method of fabricating a shoe comprising the steps of:
(a) forming a flat upper blank,
(b) perforating said blank in the toe and heel portions thereof,
(c) placing said blank over a die cavity,
(d) injecting a liquid elastomeric material through one of said perforations while said blank is maintained in a generally flat condition and venting said cavity through the other perforation,

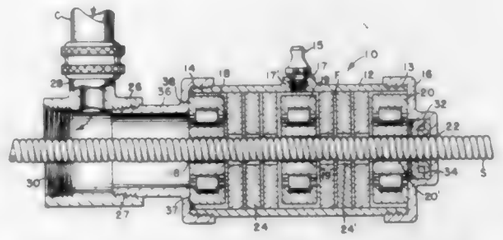
(e) heating said material sufficiently to cure it, and,
(f) folding and sewing the portions of said blank not molded to the sole into a contoured shoe upper having a foot-receiving configuration.

3,372,416
PAINT ROLLER CLEANER AND DRYER
William Katzell, 1612 102nd St., North Battleford, Saskatchewan, Canada
Filed Dec. 30, 1964, Ser. No. 422,172
2 Claims. (Cl. 15—4)



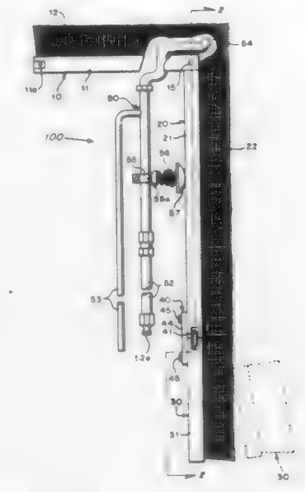
A fluted roller is journaled for rotation within a trough formed with an arcuate bottom so as to contain a limited amount of cleaning fluid. When the roller to be cleaned is placed on the top of the fluted roller, rotation of the fluted roller will cause the paint roller to spin with the consequence that a limited amount of cleaning fluid is carried upwardly by the flutes of the fluted roller and then flung over the top of the trough by the paint roller. Continued spinning of the paint roller by the fluted roller will then cause the paint roller to be rapidly dried.

3,372,417
SNAKE ATTACHMENT
James J. Devine, 209 Clifton Ave., Kingston, N.Y. 12401
Filed Dec. 15, 1965, Ser. No. 514,152
10 Claims. (Cl. 15—104.3)



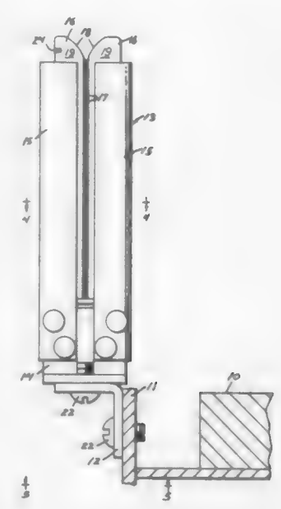
1. A snake attachment adapted to be mounted to waste lines comprising a housing and an end plate mounted at one end thereof and having a central opening disposed therein, a plurality of washers and ball bearing assemblies slidably mounted in spaced relationship within said housing and having central openings formed therein so as to form a longitudinally extending passage communicating with said opening in said end plate, means mounted on said housing for providing a sealing fluid to fill said housing and said longitudinal passage, said openings in said ball bearing assemblies being substantially equal to the diameter of the snake so as to support the external surfaces thereof at random points through said housing and said openings in said washers being at least greater than the diameter of said snake so as to form recesses for the sealing fluid whereby water is prevented from passing through said attachment and a coupling mounted to the other end of said housing having mounting means to connect the coupling to the waste line and for attaching a flexible conduit to a water source.

3,372,418
PIVOTING BRUSH
Rocco F. Di Ilio, 708 Worthington Drive, Warminster, Pa. 18974
Filed July 18, 1967, Ser. No. 654,271
6 Claims. (Cl. 15—165)



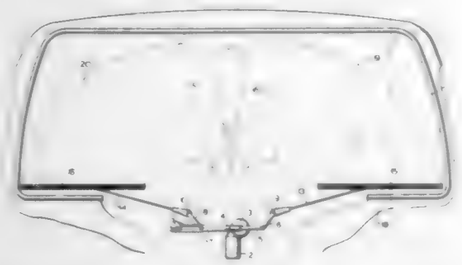
A brush having a pivoted spring-loaded arm and a water supply. The brush is provided with specific mounting and water supply connecting means. The pivoted structure permits the brush to accommodate the inside of containers of different tapers and it is intended to be a part of a can cleaning apparatus.

3,372,419
SPATULA SCRAPER
Jesse Q. Howey, P.O. Box 722, Missoula, Mont. 59801
Filed Sept. 7, 1965, Ser. No. 485,375
6 Claims. (Cl. 15—236)



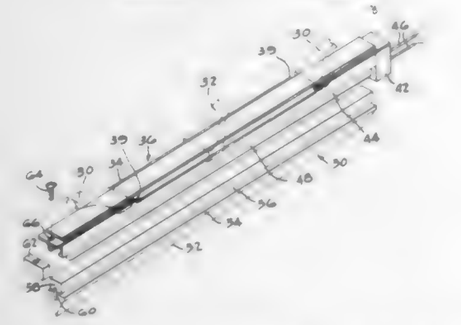
A spatula cleaner to be mounted on a cooking grill. It includes a mounting bracket, a supporting rigid housing with an open elongated slot within which the spatula blade can be inserted, and two elongated rigid scraping blades which abut one another transversely. A compression spring is located between the housing and the blades to maintain them in yieldable abutment.

3,372,420
WINDSHIELD WIPER ASSEMBLY FOR AUTOMOTIVE VEHICLES
Otto Barthruff, Stuttgart, Germany, assignor to Robert Bosch, Stuttgart, Germany
Filed Oct. 21, 1965, Ser. No. 500,003
Claims priority, application Germany, Nov. 20, 1964, B 79,417
12 Claims. (Cl. 15—250.17)



A windshield wiper assembly wherein the blade is rigid with a crank arm which is rockable about a fixed axis. An electric motor reciprocates a pusher which has a slot for a pin of the crank arm. A pawl is mounted on the pusher and can be moved into or from engagement with the pin so that the latter rocks the crank arm when it is engaged by the pawl.

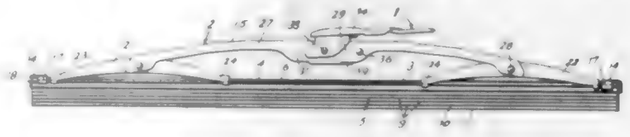
3,372,421
HEATED WINDSHIELD WIPER
Elliott A. Meltzer, 8015 Cobden Road, Laverock, Pa.
Filed Dec. 21, 1965, Ser. No. 515,376
7 Claims. (Cl. 15—250.06)



1. A windshield wiper assembly comprising a backer, means for connecting said backer to a movable support arm, a heater support means operatively connected to said backer, a heating element secured to said heater support means and extending parallel with but in spaced relation to said backer, a resilient wiper blade having a longitudinal bore therein, said blade having a longitudinally slidable connection with said backer, and said heating element being slidably encompassed by said bore when said blade is slidably connected and disconnected from said backer.

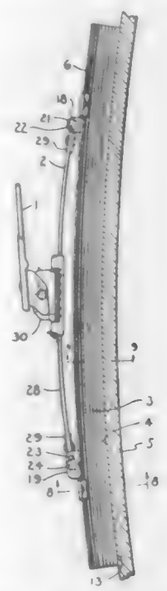
3,372,422
WINDSHIELD WIPER BLADE AND CARRIAGE ASSEMBLY
John W. Anderson, Gary, Ind., assignor, by mesne assignments, to The Anderson Company, a corporation of Indiana
Filed Aug. 7, 1947, Ser. No. 766,956
10 Claims. (Cl. 15—250.42)

1. A windshield wiper unit comprising an elongated resilient flexible body having a back portion and a wiping edge conformable to a surface to be wiped, a pair of spaced transversely aligned grooves formed in the body extending substantially throughout the length thereof and positioned between said back portion and said wiping edge, elongated backing means flexible in a plane substantially perpendicular to the surface to be wiped and substantially inflexible in a plane at right angles to said first-mentioned plane, said backing means having a pair of spaced longitudinally extending marginal edges positioned in said transversely aligned grooves, said backing means in its entirety being positioned below said back portion and being normally generally flat and lying in a plane generally parallel to the surface to be wiped and normally generally at right angles to said wiping edge, in combination with a superstructure for said unit for applying pressure thereto to cause the wiping edge of the flexible body to conform to the surface being wiped, said superstructure including longitudinally spaced apart holder means and a yoke extending lengthwise of the medial portion of said yoke and each extending inwardly and outwardly in the direction of the length of said unit from



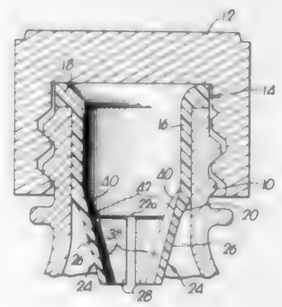
its medial pivotal connection with said yoke, each end portion of each of the holder means including oppositely laterally projecting side portions rigidly related to each other positioned to overlie portions of said backing means inwardly and outwardly of said pivotal connections for exerting downward pressure on the outer portions of said backing means, inwardly and outwardly of the pivotal connections, said laterally projecting side portions having extremities extending downwardly and inwardly below the opposite outer portions of said backing means to straddle the same inwardly and outwardly of said pivotal connections for retaining said marginal edges of said backing means in said grooves, the inner ends of each of said holder means being spaced apart a substantial distance to provide a freely flexible medial span of said backing means.

3,372,423
WINDSHIELD CLEANER
John W. Anderson, Gary, Ind., assignor, by mesne assignments, to The Anderson Company, a corporation of Indiana
Filed Dec. 13, 1945, Ser. No. 634,729
19 Claims. (Cl. 15—250.42)



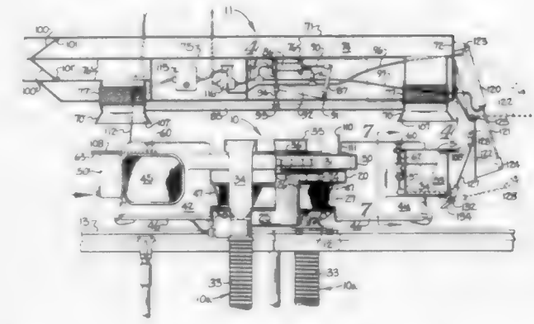
13. A windshield wiper device comprising a wiper unit, said unit including an elongated resilient flexible body having a back portion and a wiping edge conformable to a surface to be wiped, a pair of transversely aligned grooves formed in the body extending substantially throughout the length thereof and positioned between said back portion and said wiping edge, elongated backing means flexible in a plane substantially perpendicular to the surface to be wiped and substantially inflexible in a plane at right angles to said first mentioned plane, said backing means having a pair of uninterrupted longitudinally extending edges positioned in said pair of transversely aligned grooves, longitudinally spaced apart clamp means connected to said unit, and means for applying pressure to said clamp means to cause the wiping edge of the flexible body to conform to the surface being wiped.

3,372,424
SEALING INSERT FOR CONTAINERS
Leo L. Kellett, 1605 W. 76th, Kansas City, Mo. 64114
Filed Dec. 12, 1966, Ser. No. 601,024
7 Claims. (Cl. 15—257.05)



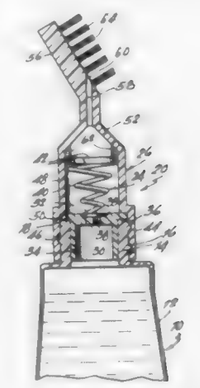
1. An insert of flexible material for a container neck, said insert comprising:
- a cylindrical body adapted to be complementally received within said neck;
- a continuous, outturned flange at the normally uppermost end of the body overlying the neck when the body is received therein,
- said body having an externally bevelled band thereabout at the opposite end thereof,
- said band having a lowermost extremity disposed in radially inwardly spaced relationship to the circumferential periphery of said body, and a pair of diametrically opposed, arcuate featheredges at said extremity; and
- a pair of spaced, elongated, diametrically opposed, transversely U-shaped lips each provided with a transversely arcuate bight and a pair of spaced, flat wings integral with the bight,
- said lips extending downwardly from said band between said featheredges,
- said bights being integral with the band at said extremity, thereby defining a line of flexure for each bight respectively at the union of the bight and the band whereby, by virtue of the bevelled band, the lines clear the neck when the body is received therewithin to permit free flexure of the lips without interference from the neck when positioned for normal use therein,
- said wings extending inwardly from the innermost, concave surfaces of corresponding bights and having uppermost ends spaced from said featheredges therebeneath,
- each wing having an upright edge extending downwardly from said end thereof,
- the upright edges of the wings of one of the lips being spaced from the upright edges of the corresponding wings of the other of said lips.

3,372,425
APPARATUS FOR CLEANING FLOORS AND DISPOSING OF FIBER WASTE IN TEXTILE MILLS
Robert L. Black, Jr., Charlotte, N.C., assignor to Parks-Cramer Company, Fitchburg, Mass., a corporation of Massachusetts
Filed Sept. 1, 1965, Ser. No. 484,381
13 Claims. (Cl. 15—312)



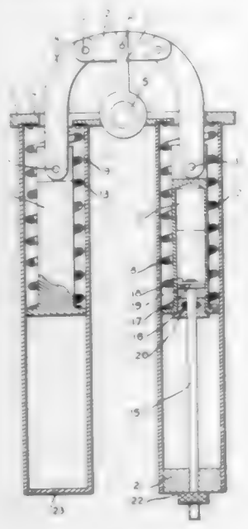
A fiber waste disposal system in which fiber waste sucked from a textile mill floor into one or more collection chambers of a traveling suction cleaner is periodically transferred therefrom by establishing communication between the chambers and a suction mouth or mouths of a stationary receiving station, during which the cleaner may be stopped at the station, and thereafter, the cleaner may resume travel past the station in the same direction as before. Such communication may be established by extending and then retracting the suction mouths relative to the station and the traveling cleaner.

3,372,426
APPLICATOR WITH BRUSH
Gilbert Schwartzman, 20 Wilmot Circle, Scarsdale, N.Y. 10583
Filed Feb. 16, 1966, Ser. No. 527,974
7 Claims. (Cl. 401—183)



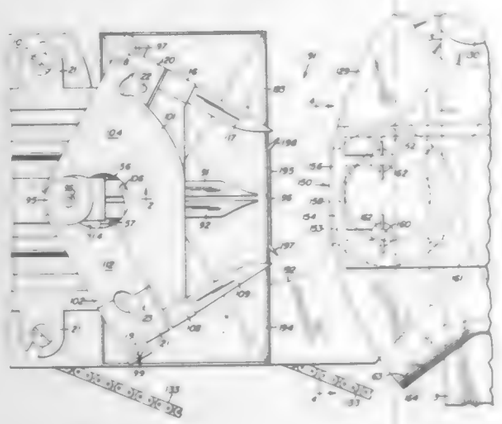
1. An applicator for a squeezable container having a threaded neck portion comprising a retaining ring having a projection portion receivable in the neck, said retaining ring being of a diameter too large to fit in said neck, said retaining ring having an opening therein forming a valve seat, an applicator body having a cylindrical threaded portion adapted to be threadedly secured on the neck, a hollow shank integral with and communicating with said cylindrical portion, said shank having a head provided with a bore therethrough communicating the outer surface of said head with said cylindrical portion, a body of compressible material disposed between said ring and said bore, and a valve assembly mounted in said body and cooperating with said valve seat to control fluid flow through said opening.

3,372,427
DOOR CLOSER MECHANISM
Mauno Kalevi Koivusalo, Yliopistonkatu 24C 50, Turku, Finland
Filed May 14, 1965, Ser. No. 455,691
2 Claims. (Cl. 16—68)



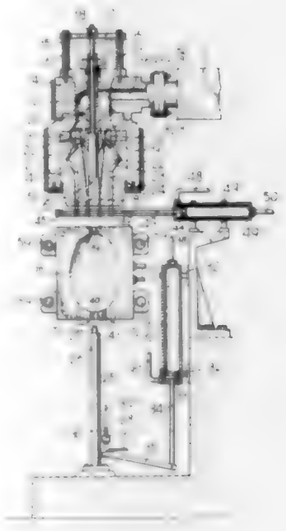
A door closer provided with two cylinders and a piston within one cylinder containing a hollow closed space full of hydraulic liquid or other fluid medium. Hence the length of that piston can be utilized for two different purposes and the main pistons of the cylinders may be made shorter with less weakening of the door structure.

3,372,428
SHELLFISH MEAT PICKING MACHINE FOR A CRAB PROCESSING APPARATUS
Daniel E. Houghton and Emmett F. Deady, Arlington, Va., assignors to the United States of America as represented by the Secretary of the Interior
Filed Mar. 29, 1966, Ser. No. 538,930
8 Claims. (Cl. 17—2)



A machine cyclically synchronized to operate together with a mechanism clamping a crab core in position to be entered by converging gouge-like blades of dual sets which in a continuing movement sever, grip, and withdraw lump meat from the core for disposal thereof by release down a chute upon the blades separating when completing their retraction from the core. A crank driven carriage cooperates with a control slide operating therein which coordinates the disposition of camming elements thereon to direct the blades into the cutting, gripping, withdrawing and releasing actions.

3,372,429
MANUFACTURE OF DOUBLE-WALLED HOLLOW PLASTIC PRODUCT
Takeo Kato, Ota-ku, Tokyo, Japan, assignor to Kabushiki Kaisha Kato Seisakujo, Tokyo, Japan
Filed Feb. 28, 1964, Ser. No. 348,187
Claims priority, application Japan, Mar. 4, 1963, 38/11,223
7 Claims. (Cl. 18—5)



2. In apparatus for manufacturing double-wall hollow plastic products, the combination of an extruding die comprising an inner die member, an annular intermediate die member and an annular outer die member concentric with one another and radially spaced apart to provide an annular inner extrusion orifice between said inner die member and intermediate die member and an annular outer extrusion orifice between said intermediate die member and said outer die member; means for periodically supplying fluidized plastic material under pressure to said extruding die to extrude simultaneously a tubular inner parison from said inner orifice and a tubular outer parison from said outer orifice; a split mold comprising mold elements movable toward one another in a direction perpendicular to said parisons to embrace said parisons and adapted to register with one another to form a complete mold; a core mold concentric with said die members and movable axially relative to said inner die member; means for moving said core mold axially into said inner parison, said core mold having a cross section less than that of said inner die member whereby said core mold is freely insertable in said inner parison, and a blow pin insertable between said parisons to blow a pressure medium therebetween to conform said outer parison to said split mold and to conform said inner parison to said core mold.

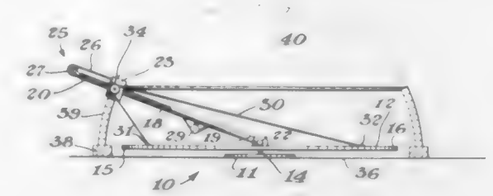
3,372,430
DEVICE FOR THE GENERATION OF SURFACES OF REVOLUTION
Fred J. Lowes, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Oct. 29, 1965, Ser. No. 505,671
6 Claims. (Cl. 18—5)

1. An apparatus for the preparation of structures of circular cross section which comprises in cooperative combination

a means for guiding the deposition of building material in a generally dome-like configuration, the apparatus having

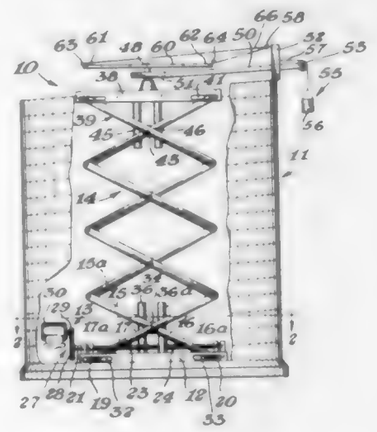
a centrally pivoted arm which is adapted to be pivoted within a solid angle generally commensurate with the surface of the desired structure, the improvement which comprises

a material dispensing head slidably mounted upon the arm,



a cable secured to a base supporting the arm, the base being rotatable about the axis of generation of the structure, the cable being secured to the base at at least two places and being movably secured to the material dispensing head.

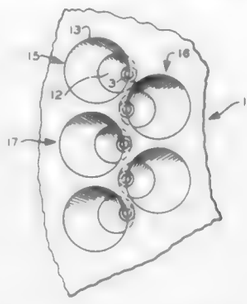
3,372,431
APPARATUS FOR PREPARATION OF STRUCTURES
Fred J. Lowes, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Jan. 24, 1966, Ser. No. 522,450
6 Claims. (Cl. 18—5)



1. In an apparatus for the generation of structures by the incremental positioning of the building material utilizing a positionable building material depositing head the improvement which comprises means to rotate the head about a fixed axis, means to continuously position the head on a generally elliptical path as the head rotates about the axis.

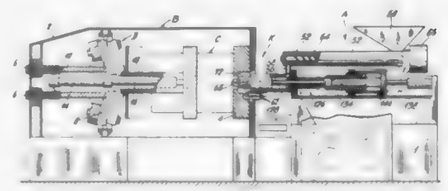
3,372,432
EXTRUSION DIE
Warren R. Howard, Beverly, N.J., assignor to Wall Industries, Inc., a corporation of De'aware
Filed June 21, 1966, Ser. No. 559,176
7 Claims. (Cl. 18—8)

1. In an extrusion die having a plurality of adjacent but spaced apart, individual, extrusion orifices, each of said orifices comprising a main passageway terminated by an inlet end on one side of the die and an outlet end on a different side of said die, the improvement comprising said inlet end of each orifice having a diameter at least about equal to the distance between the midpoints of adjacent outlet ends of the orifices, the main passageway of each orifice being tilted away from its outlet end in a manner



such that each main passageway tilts in a direction opposite from the main passageway of the orifices that are disposed adjacent to and on opposite sides of said each main passageway.

3,372,433
MOLD CLAMPING APPARATUS
Robert Nouel, Villejuif, Seine, France, assignor to Inventions Finance Corporation, a corporation of Delaware
Continuation-in-part of application Ser. No. 173,103, Feb. 13, 1962. This application Apr. 15, 1963, Ser. No. 273,145
Claims priority, application France, Dec. 22, 1962, 1,313/62
12 Claims. (Cl. 18—30)

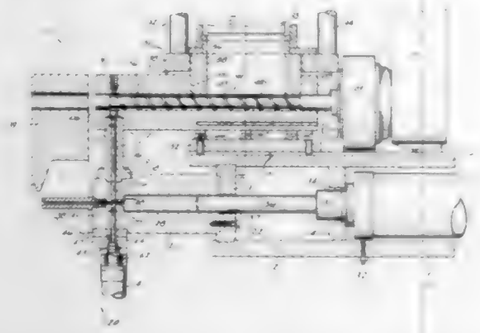


4. In a molding machine of the class described, comprising mold sections, a fluid pressure actuated jack means for moving one of said mold sections to open and closed positions relative to a complementary mold section, a thrust member engaging said one mold section and movable with the latter, fluid pressure actuated force-multiplying thrust means movable into the path of travel of said thrust member to clamp said mold sections and out of the path of travel of said thrust member to allow said jack means to move said one mold section between open and closed positions, and means for positioning said fluid pressure actuated force-multiplying thrust means axially of the path of the mold sections to provide for accommodation of mold sections of varying characteristics and dimensions.

3,372,434
MOUNTING OF EXTRUDER-FEEDER ONTO INJECTION CYLINDER WITH RELIEF FOR HEAT EXPANSION
James W. Hendry, Scottsburg, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed May 27, 1965, Ser. No. 459,222
7 Claims. (Cl. 18—30)

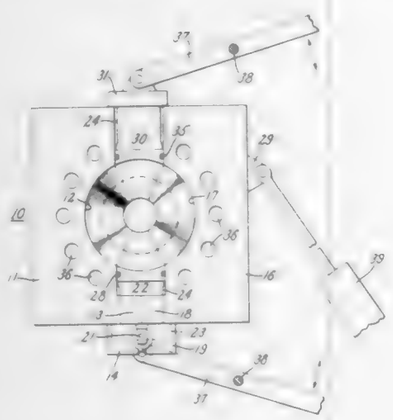
A plasticizing machine including an elongated screw housing and guide means for axially slideably mounting one end of the housing on a fixed base. The housing is provided with a longitudinal chamber. One end of a plasticizing screw is fixed for rotation with respect to the base, the screw being rotatably and slideably received in the chamber. Inlet and outlet openings communicate

with the chamber adjacent the opposite ends of the screw, the openings supplying material to be plasticized and removing plasticized material from the chamber, respectively. A conduit connects with the outlet opening and



is provided with a slip joint to allow axial expansion of the conduit. The other end of the conduit is fixed with respect to the base and communicates with a suitable consuming device.

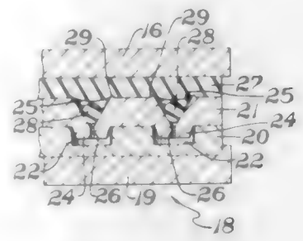
3,372,435
APPARATUS FOR FORMING PLASTIC MEMBERS
Robert J. Ford, Broomall, Pa., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed Feb. 18, 1966, Ser. No. 528,445
14 Claims. (Cl. 18—35)



1. An apparatus for molding comprising:
a pair of mold halves having complementary cavities therein,
a hinge pivotally connecting said mold halves on one edge thereof in spaced aligned relationship,
a contoured insert slidably mounted in the space between said mold halves so as to be capable of movement toward and away from said complementary cavities, and
means for reciprocating said insert towards and away from said cavities, whereby when at the innermost position said insert and mold halves form a continuous complementary mold.

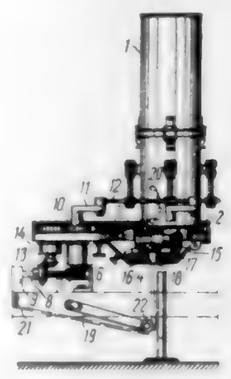
3,372,436
TRANSFER MOLDING APPARATUS
Edward A. Davis, Akron, Ohio, assignor to The B. F. Goodrich Company, New York, N.Y., a corporation of New York
Filed Apr. 12, 1966, Ser. No. 542,036
5 Claims. (Cl. 18—42)

1. A molding apparatus comprising a first and second section which are disposed one against the other, one of said sections having a plurality of cavities cooperative with the other of said sections to define a plurality of mold cavities, said other section having a plurality of downwardly extending tapered sprues communicating with said mold cavities for feeding moldable material into corresponding ones of said mold cavities, a ram located above said sections and movable downwardly toward and away



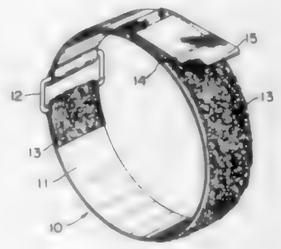
from said sections, means operatively connected to said ram for moving said ram toward and away from said sections, and means located between said ram and said other section for engagement by said ram for distortion into said sprues effecting the flow of moldable material located in said sprues from said sprues into said mold cavities.

3,372,437
COILER FOR CARDS USED IN TEXTILE INDUSTRY
Igor Nikolaevich Iliin and Pavel Ivanovich Aristov, Ivanovo, U.S.S.R., assignors to Ivanovsky Nauchno-Issledovatelsky Institut Khlopchatobumazhnoi promyshlennosti, Ivanovo, U.S.S.R.
Filed June 15, 1965, Ser. No. 464,012
1 Claim. (Cl. 19—159)



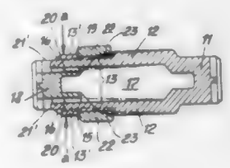
1. A coiler for cards and sliver machines employed in the textile industry, comprising a can adapted to execute a reciprocating movement along a circumference, said can having a sliver inlet opening in the lower portion thereof, means operably related to the can for preventing displacement of sliver coils relative to the can, a turntable beneath the can with the can being disposed eccentrically respecting the turntable, means for coiling the sliver in the can mounted on the turntable in close proximity to the sliver inlet opening, means mounted in said coiling means for positively feeding the sliver in an upward direction into the can through the sliver inlet, a driven shaft, a first drive connection between the driven shaft and the turntable for imparting rotary movement to the turntable, a crank mechanism operably connected to the can, and a second drive connection between the driven shaft and the crank mechanism, for imparting a reciprocating movement to the can.

3,372,438
PEEL RESISTANT TAPE ASSEMBLY
Franz G. Rinecker, Wayne, N.J., assignor to American Velcro, Inc., a corporation of New Hampshire
Filed Nov. 23, 1966, Ser. No. 596,671
5 Claims. (Cl. 24—16)



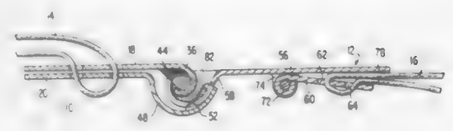
1. In a tape assembly of the type having complementary overlapping gripper type fasteners on individual portions thereof, one of said complementary fasteners being a plurality of hooks and the other a plurality of pile elements which when placed in overlapping face-to-face contact interengage and resist separation by forces substantially parallel to the interfacial plane of engagement between the portions and are readily separable by peeling forces applied substantially normal to said interfacial plane along an end of one of the engaged portions, the improvement in combination therewith in means for resisting a peeling force applied to an endmost portion of the overlapping of said portions comprising a separate tab member secured to a side of said overlapping tape portion opposite the side faced with one of said complementary fasteners but free from engagement with a marginal endmost portion thereof so that a peeling force applied to said tab is converted into shearing forces along the engaged marginal end portion of the overlapping portion thereby resisting separation.

3,372,439
PIPE HANGER
Arthur Schmid, Kreuzlingerstrasse/Grundweg 2, Romanshorn, Switzerland
Filed Oct. 21, 1965, Ser. No. 499,339
4 Claims. (Cl. 24—21)



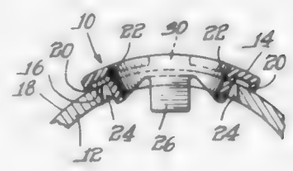
A pipe hanger including an embossed suspender band having recesses formed on one side thereof and corresponding projections on the other side thereof, the projections being shaped to engage in the recesses when the recessed side of the band is placed adjacent to the side thereof containing the projections, and a two-part connecting sleeve for securing two widths of the band together with the projections of one width of the band engaged in the recesses of the other width of the band, the two parts of the connecting sleeve forming a disengageable and detachable slider which in the disengaged state can be individually mounted on opposite sides of the two widths of the band and which can then be interlocked to hold the two widths of the band together.

3,372,440
GUARDIAN SAFETY BELT BUCKLE
Bernard Burson, Jr., Austin, Tex., assignor of sixty-six and two-thirds percent to Perry S. Brown, Austin, Tex.
Filed Dec. 23, 1965, Ser. No. 515,831
12 Claims. (Cl. 24—75)



There is disclosed herein a safety apparatus for use in automobiles, aircraft, or the like, having a pair of safety belt portions and a belt buckle arrangement having dissimilar buckle sections attached to the safety belts. A first buckle section is formed of a pair of opposed curved members arranged to define a cavity and to receive a complementary curved portion of the second buckle section. The apparatus is assembled by pivoting the second buckle section around one of the curved portions of the first buckle section to insert it into the cavity. Metal-to-metal contact of the buckle sections provides positive locking and prevents accidental disassembly. Retaining means in the form of side plates and/or a keyway and rib arrangement prevents lateral movement of the parts during use.

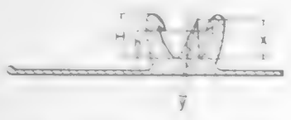
3,372,441
SNAP-IN TYPE GROMMET
Julian V. Fisher, Carpentersville, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill., a corporation of Delaware
Filed Dec. 14, 1966, Ser. No. 601,759
9 Claims. (Cl. 24—141)



1. A resilient grommet for application to a peripheral aperture in a workpiece of arcuate cross section including a circuitous body for superimposing the external surface of a workpiece along the margin of an aperture therein, the under side of said circuitous body normally defining a surface of transverse arcuate shape conforming substantially with the transverse arcuate shape of a work surface to which it may be applied, flange means along the inner margin of said body extending laterally thereof for engaging the edge of a workpiece which defines a work aperture, a substantial circuitous portion of the peripheral surface of said flange means extending laterally of said body in substantial parallelism with radii of the arc defined by the under side of said body, and diverging means extending laterally of the plane of said body and having means extending substantially parallel to the plane of the body for snappingly interlocking with the edge of a workpiece surrounding a work aperture to secure the grommet against unauthorized de-

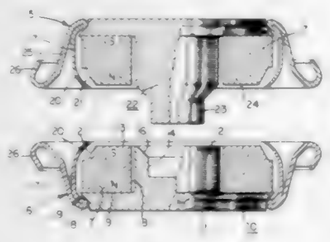
tachment when the grommet is flattened so that the diverging means snugly engages adjacent edges defining the aperture in the workpiece.

3,372,442
SYNTHETIC RESIN FASTENER
Heihachi Ishimatsu, Neyagawa-shi, Osaka-fu, Japan, assignor to High Polymer Chemical Industries, Ltd., Osaka, Japan
Filed July 18, 1966, Ser. No. 565,921
Claims priority, application Japan, Sept. 18, 1965, 40/76,090
2 Claims. (Cl. 24—201)



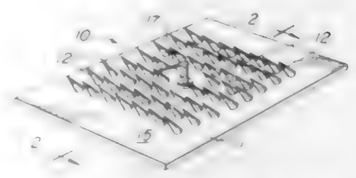
A synthetic resin fastener comprising, in combination, a female talon having a pair of facing, base ridges whose distal ends are provided, respectively, with an obliquely, inwardly and downwardly facing long-pointed projection and a similarly constituted short-pointed projection, and in the space between said facing ridges a peaked ridge having a triangular section which inclines towards said long-pointed projection at an angle up to 10 degrees with respect to a perpendicular to the base plane of the female talon; and a male talon having respectively at its two sides an obliquely, outwardly and upwardly facing deep hook groove and a similarly constituted shallow hook groove, and in its central part a valley like groove of triangular section corresponding with the peaked ridge of said female talon, the configurations of said deep and shallow hook grooves being such that they are capable of fittingly engaging with the respective long and short pointed projections of said female talon.

3,372,443
MAGNETIC FASTENING MEANS
Domenic J. Daddona, Jr., Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Filed Feb. 16, 1967, Ser. No. 616,559
5 Claims. (Cl. 24—201)



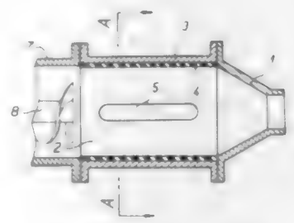
Improvements are provided in magnetic fasteners of the type used in the place of buttons on garments. The stud pin has a reduced diameter end which fits into a recess in the pin of the socket element, thus providing metal to metal lead-in surfaces and avoiding the inside beveled corner on the ceramic ferrite magnet. The socket pin extends through its magnet resulting in greater resistance to lateral stress and a more nearly continuous metal core for increased magnetic attraction of the fastener parts. The holder shells engage loosely around the magnets to eliminate breakage during assembly.

3,372,444
FASTENER WITH ROTATABLE LOCK PIN
Robert V. Mathison, 5 Woodcrest Road, Asheville, N.C. 28804
Filed Sept. 19, 1966, Ser. No. 580,294
5 Claims. (Cl. 24—204)



1. A fastening device comprising a base member, at least one relatively sharp projection emanating from a face of said base member and sloping in a given direction therefrom, a lock pin having a shank extending transversely through said base member and being rotatably journalled therein, and a relatively sharp tip portion on one end portion of said shank, said tip portion being on the same side of said face as said projection, being contiguous to said face and sloping relative to said face at an acute angle, said lock pin being rotatable to a position wherein said tip portion slopes relative to said face in the same direction as the direction of slope of said projection and to a position wherein said tip portion slopes in a direction substantially opposite to the direction of slope of said projection.

3,372,445
PRESS FOR DRAWING CERAMIC AND OTHER MATERIALS IN THE PLASTIC STATE
Karel Maurer, Jindrich Hirsl, and Ladislav Benda, Hradec Kralove, and Juda Sternküker, Prague, Czechoslovakia, assignors to Tesla, narodni podnik, Prague, Czechoslovakia
Filed Sept. 16, 1965, Ser. No. 487,725
Claims priority, application Czechoslovakia, Oct. 1, 1964, 5,445/64
3 Claims. (Cl. 25—11)



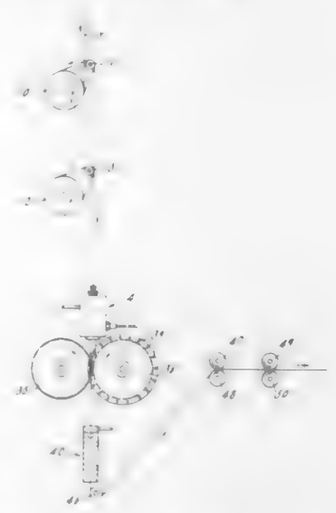
1. In a press for extruding ceramic material in the plastic state and for predrying the material before it is separated from the press, in combination:
- (a) tubular means defining a heating space therein, said space having an axis;
- (b) a tube of insulating material in said space about said axis: and
- (c) at least three electrodes having respective faces elongated in an axially extending direction and arranged on said tube in angularly offset relationship symmetrically relative to said axis, the direction of elongation of each face being inclined relative to said axis at an angle of 0 to30 degrees;
- (d) nozzle means defining an extrusion orifice;
- (e) conveyor means, said tubular means being interposed between said conveyor means and said nozzle means for conveying of a material from said conveyor means in a path extending axially through said tube in said heating space and outward of said orifice of said nozzle means, said faces being exposed to the conveyed material in said space;

- (f) a source of polyphase electric current; and
- (g) means connecting each of said electrodes to one phase of said source.

ERRATUM

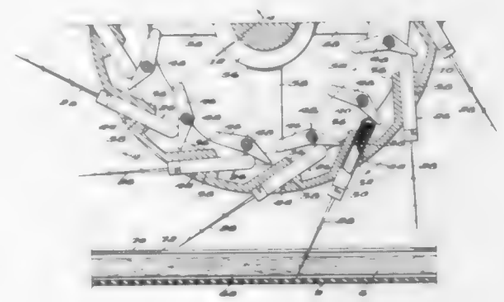
For Class 25—118 see:
Patent No. 3,372,448

3,372,446
JET CRIMPING AND TEXTURIZING APPARATUS
Daniel Shichman, Cedar Grove, and Arthur D. Siegel, Upper Montclair, N.J., assignors to Uniroyal, Inc., a corporation of New Jersey
Original application June 9, 1964, Ser. No. 373,686. Divided and this application June 2, 1967, Ser. No. 643,265
10 Claims. (Cl. 28—1)



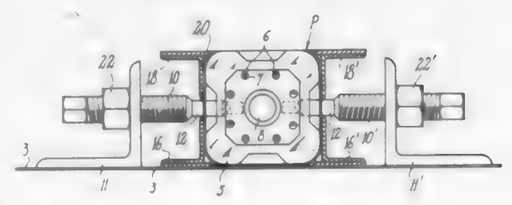
Apparatus for texturing yarn in which the yarn is steam jetted through a hypodermic needle into the nip of arcuate converging surfaces where it is compressed longitudinally and packed into the nip. One of the surfaces is rotated to pass the pack through the nip after which the yarn is taken up.

3,372,447
PROCESS AND APPARATUS FOR NEEDLE FELTING NON-WOVEN FABRICS
James A. Williams, Pearisburg, Va., and Ralph H. Balch, Charlotte, N.C., assignors to Celanese Corporation of America, New York, N.Y., a corporation of Delaware
Filed Feb. 28, 1966, Ser. No. 530,446
16 Claims. (Cl. 28—4)



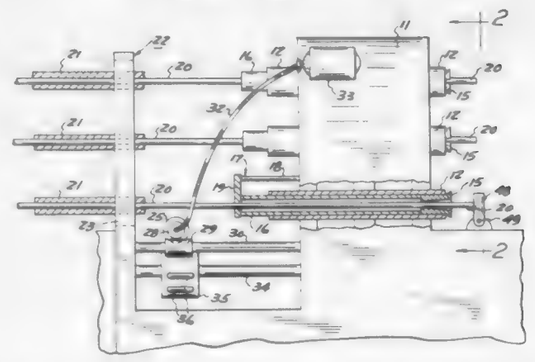
Non-woven fabrics are needle punched in a continuous manner by a plurality of needles mounted on a revolving drum. The needles enter the moving non-woven fabric at an angle less than 90° with respect to the fabric and are withdrawn from the fabric in a substantially longitudinal motion.

3,372,448
APPARATUS FOR PRESTRESSED CONCRETE MEMBERS OF NON-RECTILINEAR SHAPE
Georges Neys, Neuilly-sur-Seine, France, assignor to Societe pour la Fabrication de Produits en Beton Arme ou Precontraint Bepre, Neuilly-sur-Seine, France
Filed Nov. 18, 1964, Ser. No. 412,144
5 Claims. (Cl. 25—118)



1. In an apparatus for casting a prestressed concrete member which is of elongated non-rectilinear shape comprising:
- means defining an elongated non-rectilinear concrete form;
- means for positioning reinforcing wires within the cavity of the form longitudinally thereof including means for tensioning said wires the improvements which consist in the provision of;
- at least one perforate wire-supporting and spacing plate disposed in the cavity of said form transversely thereof and receiving said tensioned wires through the perforations therein, whereby to support the pretensioned wires in properly spaced relation across the cavity during the pouring of concrete into the form around the pre-tensioned wires and during the setting of said concrete; and
- means projecting into the cavity through opposite side walls of said form and engaging opposite sides of said plate for adjusting the transverse positions of and supporting said plate in position the pouring and setting of the concrete.

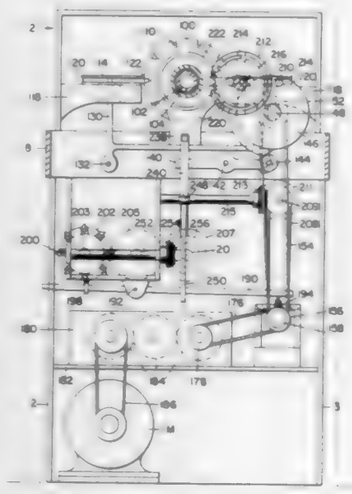
3,372,449
AUTOMATIC FEED FOR MULTIPLE SPINDLE BAR MACHINES
Eugene M. Jamison, 5669 Harvey, Detroit, Mich. 48209
Filed June 15, 1966, Ser. No. 557,712
1 Claim. (Cl. 29—37)



An automatic bar feed, for a multiple spindle bar machine, having a constantly rotating, vertically movable feed roller located beneath and in the plane of the bar to be fed and means for momentarily elevating the roller into contact with the bar for axially driving it in timed relationship to the release of the bar from its gripping collet; said means including a shaft having one end connected to the roller and its opposite end connected

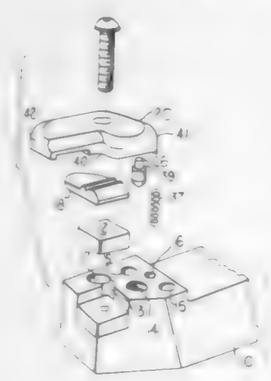
through a flexible coupling to a drive motor, with the shaft extending through a sleeve pivotally mounted upon a support shaft of the machine and rocked vertically upwardly by a timing cam, for thereby rocking the sleeve vertically upwardly and momentarily contacting the roller to the bar.

3,372,450
MACHINE TOOL
Guy C. Worrell, 10 Woodland Road, Westfield, Mass. 01085
Filed Feb. 24, 1966, Ser. No. 529,541
5 Claims. (Cl. 29—43)



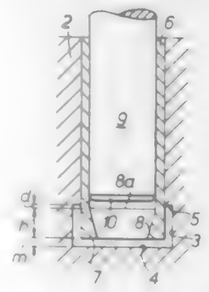
In an automatic screw machine turret indexing and locking and sliding means aimed (1) to control turret operation by means actuated synchronously with or from a slide mechanism and by which control the turret indexing movement may be initiated; (2) to lock the turret in its indexed position including fixed coacting members on the slide mechanism and on the turret, the turret and slide mechanism being separated so that the locking members will not coact during indexing; and (3) to provide, cooperant wtih a reversible slide mechanism, a turret indexing means which is rendered inoperable when the slide operating means is reversed while the machine is under hand control.

3,372,451
CUTTING TOOLS FOR MACHINES
Harold William Pinder, Stanley Beal, and Derrick Merrill, Sheffield, England, assignors to Cintride Limited, a corporation of Great Britain
Filed July 20, 1965, Ser. No. 473,340
Claims priority, application Great Britain, July 22, 1964, 29,861/64
4 Claims. (Cl. 29—96)



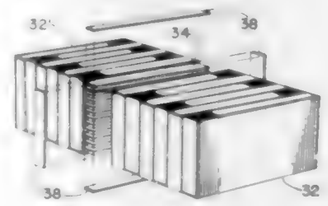
The present disclosure is drawn to a cutting tool combination wherein a clamp member holds a cutting insert in a rebate by a clamp fixing means and the clamp is resiliently acted upon by a spring member between the fixing means and one end of the clamp to maintain the clamp in engagement with the insert after partial release of the clamp fixing means.

3,372,452
SECURING OF SLEEVES IN CYLINDER BORES
Donald Firth, Roger Harvey Yorke Hancock, and William Balfour, East Kilbride, Glasgow, Scotland, assignors to Minister of Technology, London, England, a corporation
Filed Sept. 15, 1965, Ser. No. 487,543
Claims priority, application Great Britain, Sept. 25, 1964, 39,065/64
9 Claims. (Cl. 29—156.4)



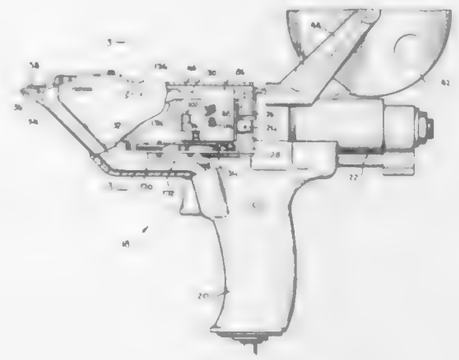
9. The method of shrink fitting a sleeve into a cylinder bore wherein the said bore is first relieved at its inner end by an annular recess and the sleeve is initially formed of a length to overlap the recess with slight positive clearance from the inner end wall of the bore, the method further comprising the steps of inwardly deforming the recess-overlapping end of the sleeve, shrink fitting the sleeve into the bore, and passing through the shrunk-in sleeve a cylindrical punch which is a close sliding fit in the mouth of the sleeve so as to expand the deformed portion into the annular recess.

3,372,453
PLATE TYPE HEAT EXCHANGER AND METHOD OF CONSTRUCTION AND REPAIR
Alan G. Butt, La Crosse, Wis., assignor to The Trane Company, La Crosse, Wis., a corporation of Wisconsin
Filed Mar. 22, 1965, Ser. No. 441,466
12 Claims. (Cl. 29—157.3)



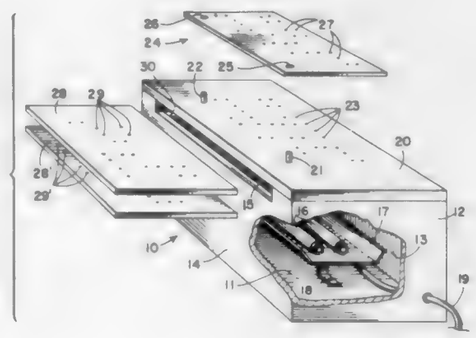
A method of assembling two plate type heat exchanger core sections for heat transfer therebetween wherein the core sections had been formed by furnace or bath brazing and the side plate surfaces between which heat is to be transferred are irregular or nonplanar due to warpage when the core sections were brazed. The method includes the placement of a corrugated metallic heat conductive sheet between the side plates of the two core sections to conduct heat from one side plate to the other side plate. The corrugated sheet is of sufficiently thin material that when pressed between the irregular plate surfaces, the convolutions thereof yield and conform to the surface irregularities thereby forming an efficient heat conductive link between the side plates. Because an efficient thermal connection is thus made, it is unnecessary to braze the corrugated metallic heat conductive sheet to both core sections which would require the reheating of the core sections to braze fusion temperatures with the attendant risk that previously brazed bonds within the core sections would be broken.

3,372,454
TOOL FOR MAKING ELECTRICAL CONNECTIONS
Howard Elroy Stine, Jr., Harrisburg, Pa., assignor to AMP Incorporated, Harrisburg, Pa.
Filed Sept. 29, 1965, Ser. No. 491,357
3 Claims. (Cl. 29—203)



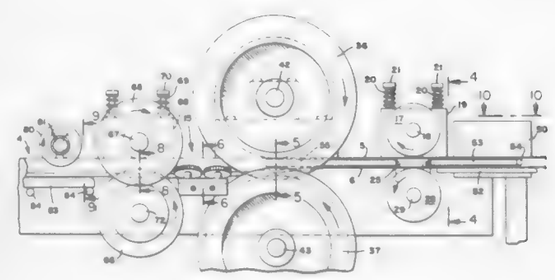
Tool for making clip-type electrical connections comprises reciprocable clip pusher and piston rod. Piston rod is coupled to clip pusher by overload release coupling and by disengageable rigid coupling. Overload release coupling comprises parallel arms mounted on coupling block on end of piston rod; arms are resiliently maintained in engagement with the yoke on the end of the clip pusher. Disengageable rigid coupling comprises detent lever on coupling block having ends which are disposed in recesses in the yoke. During movement of the piston rod, this detent arm is lowered thereby to break the disengageable rigid coupling. Overload release coupling is broken when clip pusher pushes clip against previously applied clip on the terminal post.

3,372,455
COMMON MULTIPLE PARTS LOCATING SYSTEM
James R. Howie, 20445 Roscoe Blvd., Canoga Park, Calif. 91306
Filed Oct. 6, 1965, Ser. No. 493,358
2 Claims. (Cl. 29—203)



This disclosure relates to an apparatus for facilitating the insertion of electrical components in a printed circuit board. The apparatus comprises a light box having an upper portion with openings for registration with the openings in the circuit board into which electrical components are to be inserted. Several templates are provided corresponding in number to the number of different types of multiple components to be inserted. Thus a template for all resistances of the same type is provided with openings positioned to register only with the particular openings in the circuit board for receiving resistances of like value. Insertion of the template between the light source and the openings in the enclosure and positioning the printed circuit board over the openings in the enclosure in registration therewith will result in light only being permitted to shine through certain openings in the circuit board. These openings are thus conspicuously designated and an operator may take a handful of resistances and simply insert them into the lighted openings until no light is visible. The template may then be removed and a template for another group of multiple components such as like condensers inserted in the enclosure so that light will only be permitted to shine through the openings in the circuit board for receiving condensers. The process is repeated with the other templates until the circuit board is properly filled with all of the components for the particular circuit in question.

3,372,456
MACHINE FOR FORMING DOUBLE VANES
Laffie Harper, 1192 Montgomery Ave., San Bruno, Calif. 94066
Original application Mar. 25, 1965, Ser. No. 442,689. Divided and this application June 15, 1967, Ser. No. 646,226
9 Claims. (Cl. 29—208)

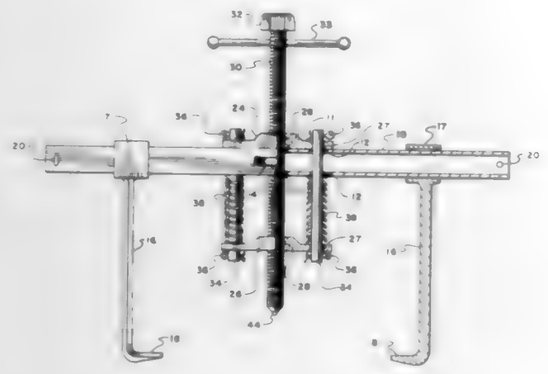


A machine into which a pair of planar sheet metal strips of corresponding width are fed in opposedly facing relation, and means in the machine bows the strips transversely thereof to the same side to different degrees to provide a space between their central portions, and thereafter means is provided in said machine for securing the strips together along their edges, in said bowed condition to provide a hollow or double vane.

3,372,457
SPRING ACTION DRAWING DEVICE
Richard L. Selby and Robert D. Selby, Flint, Mich., assignors of thirty-three and one-third percent to Harold Selby, Flint, Mich.
Filed Oct. 4, 1965, Ser. No. 492,602
3 Claims. (Cl. 29—259)

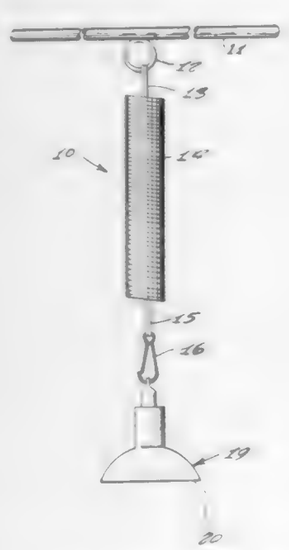
A drawing device including at least two arms adjustably supported upon a frame member and bearing feet adapted to embrace a workpiece which is to be removed from a shaft. A handle extends from the frame member to assist in engaging the device with the workpiece, and a drivescrew extends freely through the frame member parallel to said arms and is arranged to contact axially the end of the shaft from which the workpiece is to be removed. A pair of guide pins extend slidingly through

bores in the frame member, and are arranged to retain the pressure plates, and they support thereon, respectively, a pair of compression springs intermediate the frame



member and the lower pressure plate, to yieldingly urge the frame member and arms in a direction opposite to the forward end of the drivescrew.

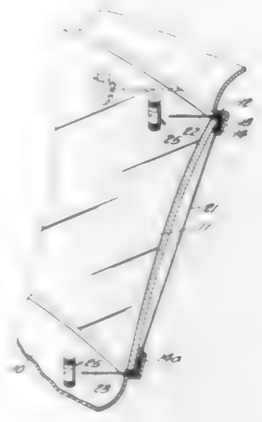
3,372,458
BEARING ALIGNING TOOL
Raymond C. Bradford, Rte. 1, Fayetteville, Tenn. 37334
Filed July 28, 1967, Ser. No. 656,941
4 Claims. (Cl. 29—271)



A tool adapted for heavy equipment vehicles wherein a wheel dolly is used to pull a wheel off. The tool includes principally a steel tube, a coil spring, a snap and aligning cone.

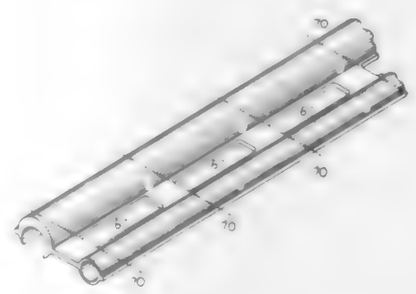
3,372,459
WINDSHIELD BOND CUTTING
Enos C. Lambright, 2359 Main St., Riverside, Calif. 92501
Filed Oct. 20, 1965, Ser. No. 498,890
2 Claims. (Cl. 29—401)

A process of salvaging windshields from automobiles wherein the glass is secured to the vehicle by adhesives characterized by punching holes through the adhesive bond at opposite sides of the windshield after removing the trim, passing a strong wire through the holes and across the pane so that on see-saw manipulation of the



wire as a cutting instrument by appropriate hand grips the pane is removed intact from the vehicle.

3,372,460
METHOD OF MAKING TAP OFF CONNECTORS
Leroy H. Burns, Cleveland, and Herbert J. Mayer, Seven Hills, Ohio, assignors to The National Telephone Supply Company, a corporation of Ohio
Original application Jan. 21, 1965, Ser. No. 427,005, now Patent No. 3,338,608, dated Aug. 29, 1967. Divided and this application Sept. 20, 1965, Ser. No. 488,576
4 Claims. (Cl. 29—417)



3. The process of making a tap off connector for connecting a straight run conductor to a take off conductor, comprising the steps of extruding a continuous length of metal which includes a web connected at either side to first and second generally parallel annular side members with the first annular side member being hollow and open along one side and the second annular side member being hollow and closed on all sides, producing a series of spaced openings in the web, and cutting said continuous length of metal into pieces in a direction transverse to the length thereof and through the openings.

4. The process of making a tap off connector for connecting a straight run conductor to a take off conductor, comprising the steps of extruding a continuous length of metal which includes a flat web connected at either side to first and second generally parallel annular side members both open on each end with the first annular side member being hollow and open along one side and the second annular side member being hollow and closed on all sides, producing a series of spaced openings in the flat web, cutting said continuous length of metal into pieces in a direction transverse to the length thereof and through the openings, closing one end of said second annular side member of the pieces, and twisting the first and second side members of the pieces relative to each other about the web to distort the web and locate the first and second side members at various angular positions relative to each other.

3,372,461
METHOD OF LAYING PIPE LINE
Prosper A. Tesson, Metairie, La., assignor to Gurtler, Herbert & Co., Inc., New Orleans, La., a corporation of Louisiana
Original application July 25, 1962, Ser. No. 212,368, now Patent No. 3,237,438, dated Mar. 1, 1966. Divided and this application Aug. 12, 1965, Ser. No. 536,245
2 Claims. (Cl. 29—429)

1. The method of laying long lines of relatively inflexible metal pipe including the steps of

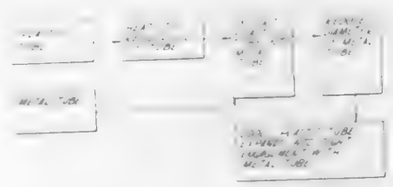
progressively joining together lengths of pipe to form a long line therefrom,

winding the pipe line onto a cylindrical reel as the lengths of pipe are joined thereto,

bending the pipe to approximately the curvature of the reel before winding it thereon,

later moving the reel along the path in which the line is to be laid, while unwinding the line from the reel and simultaneously reverse bending the pipe to substantially rectilinear configuration.

3,372,462
METHOD OF MAKING PLASTIC LINED METAL PIPE
William Bradley Reid, Kalamazoo Township, Kalamazoo County, and Walter Robert Graham, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware
Filed Oct. 11, 1965, Ser. No. 494,523
4 Claims. (Cl. 29—447)



1. A method of forming a composite tubular product comprising an inner plastic tube and an outer metal tube, which comprises the steps of:

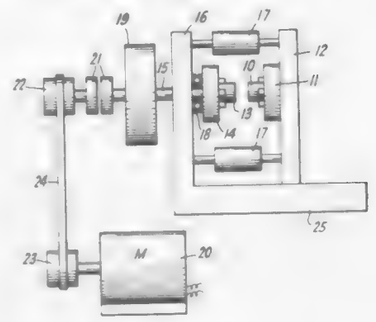
heating an elongated plastic tube to reduce the external diameter thereof;

placing the heated plastic tube inside of a metal tube which is of such an internal diameter that the heated plastic tube fits somewhat loosely therewithin;

deforming the metal tube to reduce the inside diameter of the metal tube while the plastic tube is still heated so that the internal wall of said metal tube mates with the external wall of said plastic tube; and

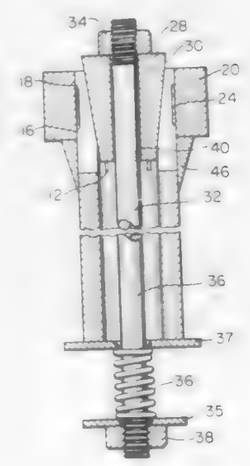
cooling the assembly to permit the plastic tube to expand so that its external wall tightly engages the internal wall of said metal tube.

3,372,463
FRICTION WELDING ZIRCONIUM ALLOYS TO NICKEL ALLOYS
Chin Jung Cheng, Norwalk, Conn., assignor to American Machine & Foundry Company, a corporation of New Jersey
Filed July 10, 1963, Ser. No. 293,935
3 Claims. (Cl. 29—470.3)



1. The method of friction welding zirconium and Zircaloy 2 workpieces to Inconel workpieces comprising the steps of rotating the workpieces relative to each other, and forcing the rotating workpieces with a force of over 10,000 pounds per square inch of weld area together so that more than 2,000 foot pounds of energy are released in the weld area for each square inch of weld area and so that the weld is completed within ten seconds.

3,372,464
METHOD OF BONDING CARBIDE TO STEEL
Renic P. Vincent and Lawrence B. Wilder, Tulsa, Okla., assignors to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Filed Oct. 22, 1965, Ser. No. 502,018
12 Claims. (Cl. 29—473.1)



1. A method of fastening a carbide ring having a longitudinal length L to a hollow steel shaft which comprises:

(a) cutting longitudinal slots in the wall of said steel shaft, said slots extending longitudinally a distance in excess of L;

(b) placing said carbide ring over the slotted portion of said shaft;

(c) providing a clearance between said shaft and said carbide ring, said clearance being for a lesser length than the length of said carbide ring;

(d) placing a brazing compound within said clearance;

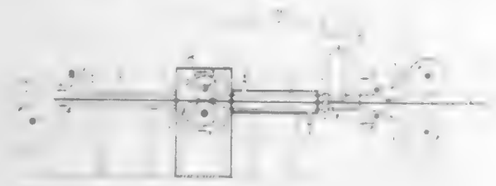
(e) placing a plug within said shaft adjacent said slotted portion, said plug having essentially the same thermal coefficient of expansion as said carbide-ring, and maintaining said plug in forceable contact with the interior wall of said steel shaft while heating the

assembly to a brazing temperature, and during the subsequent cooling of the assembly after the brazed joint is made.

3,372,465
METHOD OF BONDING LAYERS TO AN AUSTENITIC CHROMIUM STEEL CORE

Gerald H. Frieling, Jr., Barrington, R.I., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Filed May 3, 1965, Ser. No. 452,767
3 Claims. (Cl. 29—474.1)

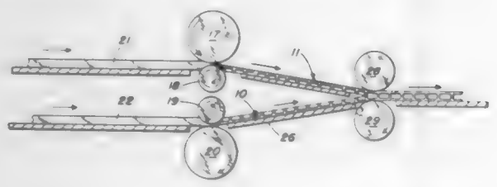


An austenitic chromium steel core, from the surface of which chromium oxide has been removed, in a cleaning solution back-plated in the solution with a solid-phase bondable chromium-free metal, such as copper or a precious metal such as, for example, silver, gold or the like. Clean strips of a cupronickel alloy or titanium are positioned on opposite sides of the plated core and moved through a reducing atmosphere, and thence directly into the bite between squeezing rolls. The core and strips are rapidly heated in their passage through the reducing atmosphere. The rolls squeeze the strips around the plated core to effect solid-phase bonding between the strips and the plating. The margins of the strips are also squeezed together and become solid-phase bonded to one another. Upon emergence of the clad material from the rolls, it is at once quickly cooled in a nitrogen atmosphere. Waste beyond the pinch lines is removed. By means of quick heating and quick cooling, excessive precipitation in the steel of detrimental carbides is avoided and the strength of the steel preserved. The plating shields the steel core against the inherently instantaneous oxidation of the steel surface to chromium oxide when exposed to air and substitutes the more slowly oxidizing surface of the copper or precious metal for effective solid-phase bonding under pressure. The resulting cupronickel or titanium surface of the resulting clad strand is corrosion resistant and in the case of the cupronickel is antifouling because of the cupric ions provided thereby when used for making submarine cables or the like.

3,372,466
METHOD OF MANUFACTURING LANDING MATS

James E. Scholl, Fairfax, Va., assignor to the United States of America as represented by the Secretary of the Navy

Filed May 6, 1965, Ser. No. 453,847
1 Claim. (Cl. 29—475)



A process of forming a metallic mat by simultaneously passing hot slabs of metal through opposed pattern forming rollers to form a pair of half mats, each having one flat and one corrugated side; feeding the half mats, with their corrugated sides in contacting relationship through pressurized rollers to weld the half mats together at all points of contact.

3,372,467
METHOD AND APPARATUS FOR PLASMA WELDING AND MAGNETICALLY CORRUGATING METAL TUBING

George J. Crowdes, West Dennis, Mass., assignor to Simplex Wire and Cable Company, Cambridge, Mass., a corporation of Massachusetts

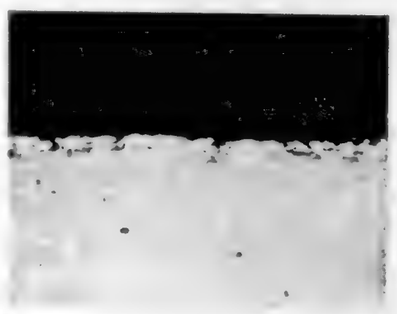
Filed Apr. 19, 1965, Ser. No. 448,981
4 Claims. (Cl. 29—480)

A method for producing shaped tubular metal products from a metal tape is shown. The tape is passed continuously through a tube forming position and a tube swaging position. In the former position, the longitudinal edges of the tape are brought into abutting relationship and a plasma of hot ionized gas is directed at the abutting edges to form a welded seam. The tube then passes through a magnetic swaging position where periodic surges of magnetic flux deform it in a desired configuration. In a preferred embodiment, a tube is first formed and then transversely corrugated.

3,372,468
METHOD OF COATING A COPPER SILVER ALLOY WITH A SILVER COAT

Michael J. Pryor, Hamden, and Joseph Winter, New Haven, Conn., assignors to Olin Mathieson Chemical Corporation, a corporation of Virginia

Filed June 24, 1965, Ser. No. 466,647
12 Claims. (Cl. 29—528)

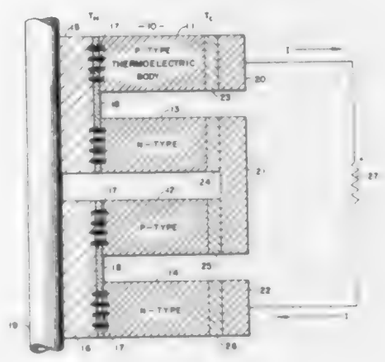


A process which comprises heating an alloy consisting essentially of 10 percent to 70 percent silver and the balance essentially of copper for at least 30 minutes in an oxidizing environment and at a temperature between the decomposition temperature of silver oxide and 780° C. thereby oxidizing surface copper to copper oxide to a depth of at least 0.1 ml.; and removing copper oxide from said surface.

3,372,469
METHOD AND MATERIALS FOR OBTAINING LOW-RESISTANCE BONDS TO THERMOELECTRIC BODIES

Kasimir Langrod, Sherman Oaks, Calif., assignor to North American Rockwell Corporation, a corporation of Delaware

Filed Oct. 28, 1963, Ser. No. 319,300
9 Claims. (Cl. 29—573)

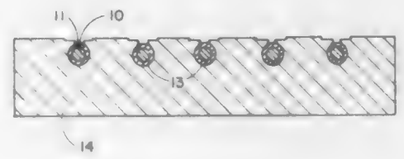


1. The method of bonding a thermoelectric body to a conductive body to provide low resistance electrical contacts between said bodies comprising the steps of disposing a barrier layer and conductive granules between facing surfaces of the bodies to be joined, and contacting said surfaces while applying pressure thereto to bond said bodies and penetrate said barrier layer by said conductive granules, thereby forming low-resistance conductive paths between said bodies through said barrier layer.

3,372,470
PROCESS FOR MAKING COMPOSITE CONDUCTORS

Ahmed El Bindari, Cambridge, Mass., assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware

Filed July 17, 1964, Ser. No. 383,392
18 Claims. (Cl. 29—599)



1. The method of forming an electrically and thermally-conductive connection between an electrically-conductive normal first metal and a superconductive material having a melting point in excess of about 800° C., comprising the steps of:

(a) depositing in uniform, adhering and continuous intimate contact on said superconductive material an electrically-conductive normal metal substantially incapable of forming a metallic compound having a high electrical and thermal resistivity with said first metal;

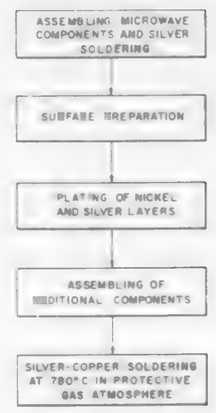
(b) continuously maintaining said first metal and said deposited metal under pressure in uniform and continuous intimate contact; and

(c) heat treating said first metal, deposited metal, and superconductive material at a temperature lower than the melting point of any of the said metals or material and for a period of time sufficient to produce interdiffusion of the deposited metal and said first metal and insufficient to produce diffusion of said deposited metal into said superconductive material.

3,372,471
METHOD OF MANUFACTURING MICROWAVE COMPONENTS

Hans Kuhn, Pforzheim, Germany, assignor to International Standard Electric Corporation, New York, N.Y., a corporation of Delaware

Filed Oct. 20, 1964, Ser. No. 405,229
Claims priority, application Germany, Oct. 26, 1963, St 21,250
5 Claims. (Cl. 29—600)



ASSEMBLING MICROWAVE COMPONENTS AND SILVER SOLDERING
SURFACE PREPARATION
PLATING OF NICKEL AND SILVER LAYERS
ASSEMBLING OF ADDITIONAL COMPONENTS
SILVER-COPPER SOLDERING AT 780°C IN PROTECTIVE GAS ATMOSPHERE

1. A method of producing microwave components by electroplating and thereafter soldering within a protective gas atmosphere, and where said components are formed of a base material of steel having relatively constant length when subjected to heating, and are assembled into several subassemblies which are accessible for performing the plating comprising the steps of plating a layer of nickel on the steel base material of the assembled components, said nickel layer having a thickness of several microns for corrosion protection, plating a layer of silver having a thickness of several microns over the nickel layer to increase conductivity, soldering together within a protective gas atmosphere the several subassemblies with a solder of good electrical conductivity at a temperature which fuses the plated layers into the base material.

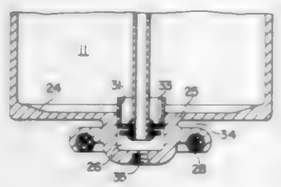
3,372,472
METHOD FOR FORMING A THERMOELECTRIC MODULE

Gerald K. Gable, North Syracuse, and George D. Hudelson, Fayetteville, N.Y., assignors to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware

Filed May 22, 1962, Ser. No. 196,732
1 Claim. (Cl. 29—611)

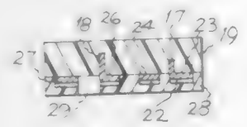
1. A method for forming a thermoelectric module, said method comprising the steps of: encasing an elongate rod of thermoelectric material in an insulating material; bonding the insulating material to the surface of the rod of thermoelectric material; forming the exterior surface of the insulating material with flat surfaces; and severing desired lengths of the encased rod to provide thermoelectric modules of desired dimensions for assembly into a thermoelectric device.

3,372,473
METHOD OF FABRICATING PERCOLATOR VESSEL AND PUMP CONSTRUCTIONS
David B. Price, Mansfield, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Continuation-in-part of application Ser. No. 326,832, Nov. 29, 1963. This application Mar. 31, 1965, Ser. No. 447,597
3 Claims. (Cl. 29—611)



1. Method of fabricating percolator vessel and pump constructions comprising the step of: simultaneously forming a cylindrical vessel having a closed bottom end, a wall in said bottom end, an annular groove in one end of said wall and a pump well chamber in the end of said wall opposite the end having said groove cutting away wall material between the annular groove and the bottom of said vessel to form a channel whereby the heat will necessarily be directed to the pump chamber and placing a heating element in said annular groove and bending one of the walls forming said groove over said heating element.

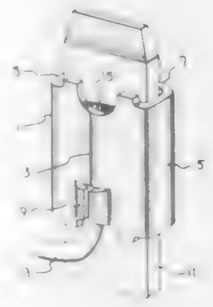
3,372,474
SYSTEM FOR WELDABLE CIRCUITS
Robert W. Polley and Robert W. Tabor, Nashua, N.H., assignors to Sanders Associates, Inc., Nashua, N.H., a corporation of Delaware
Filed Nov. 8, 1963, Ser. No. 322,461
7 Claims. (Cl. 29—626)



1. A method of making an electrical circuit article with a clean electrically connectable protruding terminal tab portion comprising the steps of:
(a) forming a protruding tab in a metal sheet, which tab is formed so as to be angularly disposed with respect to the plane of said sheet,
(b) bonding a removable protective insulating matrix layer of material to said metal sheet to embed said protruding tab portion in said matrix material,
(c) selectively removing portions of said metal sheet to establish a circuit configuration which includes said protruding tab portion as part of said circuit configuration,
(d) bonding said circuit configuration and said matrix layer to an insulating base lamina so that said circuit configuration is intermediate said matrix layer and said base lamina, and
(e) removing said protective insulating matrix layer to expose said tab portion which may then be interconnected to an electronic component.

7. A storable electrical circuit article comprised of:
(a) a metal circuit configuration bonded to an insulating base lamina having a protruding tab portion integral with said circuit configuration and angularly disposed at an angle of less than 180° with respect to the plane thereof for subsequent electrical connection to a component, and
(b) a removable protective host sheet material surrounding said tab portion and completely covering said circuit configuration to thereby protect said tab portion and related circuit configuration during subsequent handling and storage.

3,372,475
METHOD FOR WIRING
John Roy Vickery, Jr., York, Pa., assignor to AMP Incorporated, Harrisburg, Pa.
Original application July 9, 1963, Ser. No. 293,602, now Patent No. 3,186,077, dated June 1, 1965. Divided and this application Feb. 2, 1965, Ser. No. 429,734
3 Claims. (Cl. 29—628)



Method of making clip-type electrical connections comprises steps of feeding wire from endless source and locating the end of the wire above, and in alignment with, the terminal post. Clip is thereafter moved onto post to make first clip-type connection. Wire is therefore fed from source to the second post and wire is located with its axis extending above the top of the second post and to endless source. Second clip is thereafter moved onto second post so that the wire extends from second connection to the source. Third and subsequent connections can be made in similar manner without severing the wire to provide a continuous conductor between several posts.

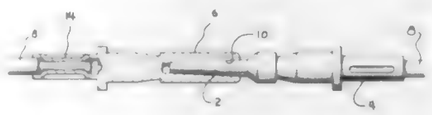
METHOD OF MAKING PERMANENT CONNECTIONS BETWEEN INTERFITTING PARTS
Howard Richard Peiffer, New Cumberland, and Thomas James Schuetz, Camp Hill, Pa., assignors to AMP Incorporated, Harrisburg, Pa.
Continuation of application Ser. No. 521,337, Jan. 18, 1966. This application Apr. 5, 1967, Ser. No. 628,781
1 Claim. (Cl. 29—628)



Invention discloses method of forming permanent connection between interfitting parts, the parts having a surface of material selected from the group consisting of copper, copper alloys, gold, and silver. In accordance with the method, one of the parts is coated with indium to a thickness in the range of 20 microinches to 150 microinches. The parts are engaged with each other and allowed to stand at room temperature. Permanent connection is achieved within a short time by keying mechanism resulting from the growth of an intermetallic compound which is formed at room temperature and which is stable at room temperature.

SURGICAL SUTURE EXTRACTOR
Clemens B. Hoppe, P.O. Box 590, Palm Beach, Fla. 33480
Continuation-in-part of application Ser. No. 406,861, Oct. 27, 1964. This application Dec. 15, 1966, Ser. No. 601,966
5 Claims. (Cl. 30—124)

An instrument for severing sutures and substantially simultaneously gripping the cut-off thread or stitch so that it can be cut off and removed in a single motion of the surgeon's hand.

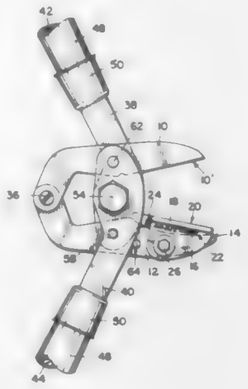
LOPPING SHEARS WITH A COMPOUND ACTION
Edward M. Wallace, Longmeadow, and Wallace M. Preston, West Springfield, Mass., assignors to Wallace Mfg. Corp., West Springfield, Mass., a corporation
Filed Sept. 20, 1965, Ser. No. 488,329
1 Claim. (Cl. 30—193)



Lopping shears incorporating a compound mechanism for maintaining a cutting jaw and an anvil jaw in the same plane comprising, a cutting jaw, an anvil jaw and an anvil on the anvil jaw having a bearing surface in line contact with the cutting edge of the cutting jaw in shear-closed position, wherein the cutting an anvil jaws are disposed predominantly in the same plane, and wherein a floating jaw pivot pivotally interconnects the cutting jaw and anvil jaw at their respective rearward portions, there being additionally a pair of handle levers having forwardly-projecting portions and a handle pivot pivotally interconnecting the handle levers in a scissor-like formation independent of and forwardly of the jaw pivot, with the forwardly projecting portion of each handle lever being located in juxtaposition to one of the jaws and a pair of pintle means each interconnecting one of the jaws and the forwardly-projecting portion of the respective juxtaposed one of the handle levers.

CUTTING JAW HEAD UNIT FOR A NIPPING TOOL
Howard R. Fischer, New Hartford, N.Y., assignor to Chicago Pneumatic Tool Company, New York, N.Y., a corporation of New Jersey
Filed Apr. 29, 1966, Ser. No. 546,306
7 Claims. (Cl. 30—180)
